SOME of the daily papers have begun a systematic campaign in praise of the express companies and their work. They make a special point of the free collection and delivery service. They must remember that these city conditions are not found in the country. About one-half of the people in this country cannot have any such express service. They must go to the town or the railroad station to send or receive packages. The parcel post delivery at the farm house does save many a long trip during the year. The city man must remember that "there are others." The very convenience of his express service has been forced by the competition of parcel post.

*

THE study of this potash situation will lead to increased uses of lime. The scientists do not fully agree as to the value of lime in making soil potash available, but it is true that the use of lime will enable many crops to make a more vigorous growth. Therefore, we think more lime than ever before will be used. Let us understand that "ground limestone" is the raw lime rock as taken from the quarry, crushed or ground to a powder. "Slaked" lime is the lime rock first burned and then "slaked" by the addition of water. This water causes the burnt or lump lime to crumble into powder. On the great majority of our Eastern soils our advice would be to use the slaked lime rather than the ground limestone. In some cases lime can be bought in one form cheaper than in another. We should figure to buy the cheapest pound of lime and remember that two pounds of ground limestone must be used to obtain the effect of one pound of burned lime.

*

AT this time it seems to be without question that the war in Europe will prevent shipments of potash from Germany. At present there is no other source of potash for the greater proportion of our fertilizers. Small quantities of wood ashes and nitrate of potash are used, but with the German supply cut off our manufacturers cannot make what has been considered in the past a "complete fertilizer." There is, of course, a small quantity of potash now in the country, but naturally the supplies for next year's crop would have been shipped here during the Fall and Winter, and are now held up. There is no use considering the potash deposits in this country. They are mostly in the form of rocks and minerals, and so unavailable that the expense of preparing them for plant food will put them out of reach. Certain kinds of seaweed, particularly kelp on the Pacific Coast, will provide some potash, and, of course, all ashes from wood fuel should be saved. In general, however, it is a case of using a small quantity of potash or none at all, and trying to utilize the stores of this element now in the soil. The first of a series of articles discussing this question is found on page 1047. Dr. Lipman outlines some of the things which may be done to make the soil give up its potash more freely. What he says is a new argument for the cover crop and for lime. Clover, vetch, rye, turnips or any of the others should be seeded on land that would otherwise be bare through the Fall. All of these crops will take up more or less potash. Turnips and rape in particular will utilize forms of potash which some other crops could not use. This will all go back to the soil when these cover crops are plowed under in the Spring. Then when lime is used this organic matter will decay rapidly and the lime will also have an effect upon the soil. The first lesson which this threatened potash "famine" teaches us is to make sure of our cover crops this Fall, as the most effective way of forcing our soils to give back some of the potash which we have applied during the past years. We have no fear but that this potash problem will work itself out. There are millions of tons of granite rocks in New England and elsewhere which contain potash. Necessity may drive some of our inventors and chemists to the point of discovering a process by means of which this crude potash may be made available at a reasonable price. We shall give a thorough study of the situation from all sides. But be sure of one thing! The fakes and the half-fakes will probably seize this opportunity for offering "potash substitutes" or "new forms of potash." We warn our readers promptly and earnestly to pay no attention to such offers. Do not buy any form of potash until the chemists at our experiment stations write their O. K. on it.

*

PRESIDENT WILSON gives the American people wise and timely advice when he urges them to avoid passionate discussion of the European war, or of partisanship in taking sides with one nation or another:

> My thought is of America. I am speaking, I feel sure, the earnest wish and purpose of every thoughtful American that this great country of ours, which is, of course, the first in our thoughts and in our hearts, should show herself in this time of peculiar trial a nation fit beyond others to exhibit the fine poise of undisturbed judgment, the dignity of self-control, the efficiency of dispassionate action; a nation that neither sits in judgment upon others nor is disturbed in her own counsels and which keeps herself fit and free to do what is honest and disinterested and truly serviceable for the peace of the world. Shall we not resolve to put upon ourselves the restraints which will bring to our people the happiness and the great and lasting influence for peace we covet for them.

THE R. N.-Y. most heartily says *Amen!* We shall take this advice just as President Wilson gives it and we hope all our readers will do the same. Let us understand as well as we can the causes which have led to this war, and let us have as accurate news as possible regarding its progress. Beyond that we have confidence in the ability of the Administration to handle any situation in which our National interests are involved. We shall spend no time trying to tell President Wilson what to do. He knows what is necessary and he will do his duty. Nor do we intend to make the problems of the Administration harder by stirring up race prejudices or hatreds. This is a time for self-restraint. We all have our individual opinions or convictions, but the issues or conditions which provoked this war are essentially European and do not concern us directly. Let this country attend strictly to its own business. In this great crisis that business is to make all Europe understood that we stand fairly and impartially for peace and honorable dealing, and also to do our share toward feeding and clothing the world. In all the history of the world no nation ever had a better opportunity to gain, both moral and material advantage, than is now offered America. Let us all do our share to rise above petty hatreds or political prejudices, and make the world see that America is not a mere collection of European immigrants, but a compact great nation with ideals and vision and self-restraint of its own.

*

WE want our readers to understand all sides of this food distribution problem. There are many sides to it, all of which country housewive have not experienced. On page 1059 we give some statements regarding food wastes in this great city. The author goes on with this indictment of many city women:

> The moving picture shows and theatres, while entertaining and educational, are the greatest blight that has struck the household since the first century; women with three or four children will repair to the "movies" and stay there until they expect their husbands home, when the delicatessen store is the base of supply for the family. With housewives refusing to prepare the family meals and feeding their children on poorly cooked, inferior food from the delicatessen store, what kind of an army could be raised 25 years hence in this country?

This is probably true of a certain class of city women, but it is not true of all. There are many who are buying food economically and using it without waste. There are to be found false ideas of economy and of life in general everywhere. They can only be removed by patient education and good example. Let us all understand that wastes of food are like war—economic crimes which always fall hardest upon the producers.

*

NOTING communication of S. J. K. on page 1014, taking exception to your statement that all wealth in the country comes from farmers, I think that you are hedging when you repeat the statement, but add to it the miner and forester. We presume by giving the matter a little further thought you will add the fisherman, and there may be others that you might want to add as you go along. I am only too glad to admit the great part the farmer plays in our civilization, but I agree with S. J. K. that your statement that all the wealth of the country comes from the farmer is ridiculous. J. M.

We have never claimed that all wealth came from the farmer. There is no "hedging." S. J. K. tried to change what we did say. We do claim that it all came originally from the soil. Our friend speaks of the fisherman. Will he tell us of any value in the water which was not originally washed out of the land? What do fish live upon if not from the land's products? You might name ice as a commercial product, which does not originally trace back to the land, but where do you find another? We are not "hedging" but have stated distinctly that all wealth comes from the land. So it does!

*

THERE are many calls for "Grimm" Alfalfa seed. This is a superior variety grown in the Northwest. Last year there was much complaint over frauds in selling this seed. Some of the seedsmen advertised early that they wanted to buy the "Grimm," and then later offered the seed for sale. They had little of it, but the buyer usually receives some inferior seed with a little of the "Grimm" mixed with it. The Department of Agriculture gives us the following statement about this seed:

> There is now a considerable quantity of seed of this variety being produced in the western part of the United States. It is true, of course, that there is being offered on the market a large quantity of seed of common Alfalfa under the name of Grimm; but if reasonable precaution is exercised, the true variety can be procured at a cost of from 25 to 75 cents per pound. There will doubtless be several hundred thousand pounds in the market. The production of Grimm Alfalfa is being taken up quite extensively in South Dakota, Montana, and Idaho, and so far as we are able to determine there is no material difference in the results from the seed produced in these States.

*

ON page 1015 I find a statement that the New York State hay crop will not be as large as last year, and on the day I received THE R. N.-Y. the Syracuse *Post-Standard* contained a statement that the hay crop was 2,000,000 tons greater than last year. Where does the misleading statement come from, for certainly one is misleading. O. L. B.
Canton, N. Y.

The first statement referred to the New York hay crop, which, according to the New York State Department of Agriculture, is smaller than last year, though larger than for several previous years. The clipping from the *Post-Standard* was a report of the New York State Hay Dealers' meeting at Syracuse, where it was said that the State crop is 2,000,000 tons above last year. At this season buyers of farm products see very large crops of their specialties, and are sure that the price to the producer should be low. The National Government report, the result of unbiased investigation, gives the hay yield for the entire country as 1.1 per cent. less than last year, and the crop condition 4.9 per cent. better. The dealers' estimate of 2,000,000 tons excess in New York State certainly needs discounting.

BREVITIES.

VERY likely your word box needs clearing out.

WE never had so many people writing to ask where they can buy wheat direct from farmers.

ALFALFA meal is all right, but why pay the miller $10 a ton for grinding it when the cow will do her own grinding if you give her the hay?

THE United States Department of Agriculture will fully examine specimens of wheat plants to see if they have been attacked by the Hessian fly.

THE South Dakota Experiment Station has developed a "60-day oat" which is said to ripen so early that it can be harvested before barley or wheat.

THE latest is an organization known as the Farmers' Congressional League. It aims to candidates for office who are farmers or editors of farm papers.

THE Belgians have certainly shown great spirit and energy in the present war. One of our readers says he has some Belgian potatoes growing on his farm. He adds: "I am going to feed them to my boys."

HERE'S a kindly spirit—there might be more of it: "Hope your crop will beat mine every way. That will not reduce mine any in size or quality. Better weather for them here this year than last, but it remains to be seen whether the mangels will do better. F. B. D."

HERE is one we would like to have answered: "Last year I canned a basket of peaches brought from the hills in an automobile truck. They were beautiful big peaches, very ripe, but most terribly bruised all over, and clingstone beside. The canned fruit looked as if it had been chopped. Is that always the result of fruit marketed in an auto truck?"

WOMAN AND HOME

:: John Henry Buys a Horse ::

By Mrs. Cora Hamilton

:: No More Stove Wood ::

A Treatment That Worked

John Henry Buys a New Horse.

JOHN HENRY had to buy a new horse, that was certain. He had lost one of his horses the Summer before, and the one he bought to replace it had turned out to be balky, so he sold it in the Fall. One horse was enough during the Winter to drive to town or go visiting with. But now Spring was here, and "How could a man plow, drag and do the other work on a farm in the Spring?" he asked Mrs. John Henry.

"Of course you must have a new horse," she replied (as he knew she

THEY STAYED RIGHT THERE.

would), so John Henry interviewed every one he met as to where he could get "a good horse cheap." He was told of many different bargains and after looking around for a week or more decided to buy one offered to him by a friend (?) in the city. "A fine looking horse, good worker, anywhere you put him, just what you need, I am sure," said his friend.

Proudly John Henry drove him home and called all the family out to see his splendid bargain.

"I tell you it takes the old man to tell a good horse," he remarked complacently.

Next day John Henry decided to draw a load of straw to market. Hitching the team to the hay wagon he drove around to the shed and proceeded to load the straw. Then with a flourish of the whip and a cheery "Git ap boys," he drove round in front of the house, climbed down off the load, went in and changed his old hat for his Sunday best one, got his coat and getting back on the load waved his hand at mother and the kids and with another flourish of the whip and cheery "Git ap boys," *stayed right where he was.* In vain he shouted, in vain he cracked the whip, and finally got down off the load, took the splendid bargain (?) by the bridle, pulled, coaxed, talked, whipped and shouted. Mr. Horse merely stood there as if he never intended to go again.

After alternately waiting, coaxing and whipping he finally unhitched the horses and sadly took his way back to the barn, saying to himself as he went, "Who would have thunk him a balker?" Returning to the house he called his friend up on

"THIS IS OUR OLD BOB."

the telephone and told him his experience and said:

"I want you to come and git him jest as quick as you can."

The friend protested, was sure the horse was all right, couldn't believe it possible that he would balk, but finally said:

"I will bring you another one, that I will positively guarantee will not balk with you."

After dark that night he drove up leading a horse behind his wagon.

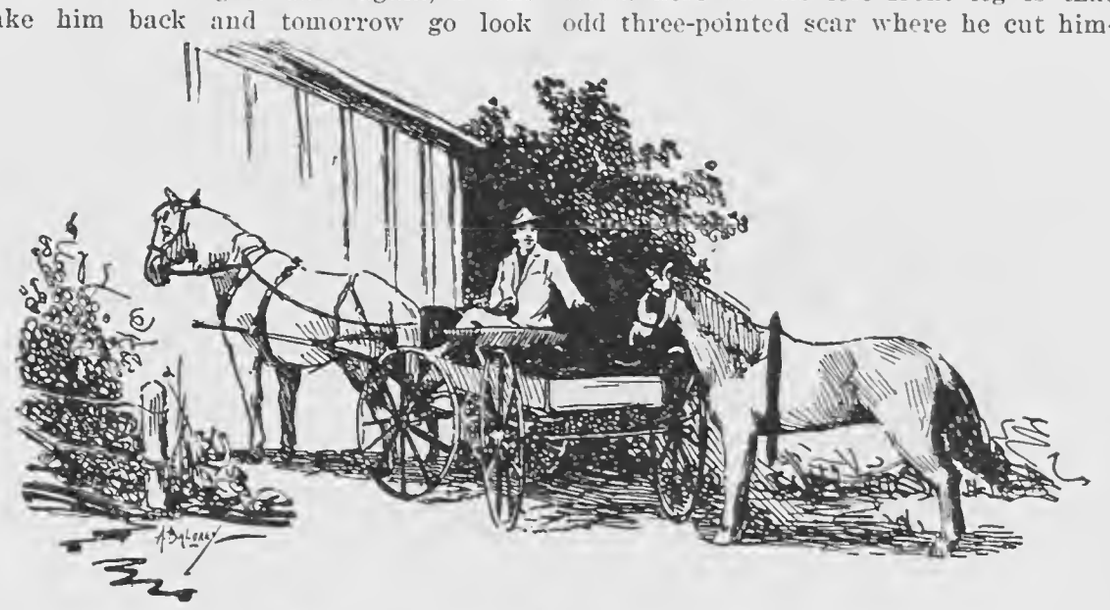
"There, John Henry," he said, "is a horse I know will not balk." So taking horse No. 1 with him he went back home. John Henry gazed rather doubtfully at horse No. 2. But as he remarked to Mrs. John Henry, "perhaps he will work better than he looks."

Next day he harnessed him up with Old Faithful and started to plow the garden, Mrs. John Henry and all the little John Henrys standing in a row to watch Daddy plow Maw's garden. But the new horse could scarcely travel, let alone drawing the plow. He limped in front, he limped behind, he even limped sideways.

"If there is one leg he limps on more than the other, it would be hard to find which one it is," said John Henry in deep disgust, as he put the poor animal back in the barn.

"No wonder Mr. Jones waited till dark to bring him here," said Mrs. John Henry.

"And when it gets dark again, I will take him back and tomorrow go look



IT TAKES THE OLD MAN TO BUY A HORSE.

somewhere else for a horse," said John Henry savagely, so that night he tied him behind the wagon and returned him to Mr. Jones.

"If you had turned him out to pasture you wouldn't take twice what I asked you for him next Fall," said Mr. Jones.

"I am not looking for a horse to pasture but one to work," answered John Henry. The next day John Henry went to a sales stable where there were a number of horses for sale, telling the man in charge what he wanted. The man said: "Yes, sir, I have some splendid work horses, and am sure you can find just what you are looking for." John Henry looked the different horses over carefully.

"Better let me sell you this pair of iron grays," said the stableman.

"No," said John Henry, "I only want one to put with Old Faithful."

"Well here are several, all good ones, take your pick."

John Henry looked them over several times very carefully, finally deciding on a large fine-looking horse that had just been clipped.

"You certainly know a good horse when you see one," said the salesman. "The man that brought that horse here to be sold, said he was one of the best horses he ever owned."

John Henry hitched the new horse, who was called Pete to the buggy, tied Old Faithful behind and started home.

"How strange," thought John Henry as he reached home and Pete turned into the lane leading to the house before he pulled on the rein. "Seems to know just where he is going, must be a mighty smart hoss all right, all right; knows jest where I want him to go before I tell him."

Stopping in front of the kitchen door he hollered:

"Hey, Maw, come out and see if your old man ain't some pumpkins, when it comes to picking out a good hoss."

Mrs. John Henry came to the door, stared at the horse for several minutes without saying a word. Finally she went around and looked at him from the other side, and then stood in front of him; looked him over once more and said: "John Henry, what in the world did you go and buy Old Bob back for after all the trouble you had with him balking so much with you last Summer?"

"Old Bob nothing," angrily exclaimed John Henry, "this horse is a different color than Old Bob was and fatter too.

"I don't care," said Mrs. John Henry, "if he is it is because he has just been clipped, and it is Old Bob just the same. Look, here on his left front leg is that odd three-pointed scar where he cut himself on the barb wire fence, and the two little spots where that old collar made his neck sore in haying."

"Well, I'll be switched," finally exclaimed John Henry, "next time I buy a hoss I'll take you along, or no knowing what I'll get next time, and say Maw, I get you that new dress down to Palmer's you wanted if you will promise not to tell what an old fool I be, going and paying a fancy price for a hoss I pretty near give away last Fall to git rid of him."

No More Stove Wood.

I DO know if men folks ain't the most provokin' animals that live on this farm! Here it is 10 o'clock, and not a stick of wood cut to make a fire in the cooking stove. But dinner's got to be on the table at 12 o'clock or something terrible would happen. Talk about the Egyptians, my men folks do certainly expect me to make bricks without straw! Seems to me if I loved to eat like some folks do, I could remember to leave enough wood cut to cook something, every day of my life I've got to pick up enough chips and pieces of bark to start a fire in the stove, and chop of as much wood as I can keep it going, I tell you I'm tired, and what's more I ain't going to do it another day, I'm going to cure them once for all, I bet I'll give them one surprise."

Mrs. Coward, who for more than 35 years had carried all the water from a spring at the foot of a steep hill, and had eked out a meager pile of stove wood by hacking away at a hand log with a heavy ax, in order to have three piping hot meals ready for the exacting farmer, her husband, the boys and the hired man, made up her mind to rebel. Grimly she

MOTHER ISN'T DINNER READY.

took down the big tin dishpan and put on her old sun-bonnet, for this was no joke for a patient pack-horse suddenly to get balky, and went out to the garden to gather the vegetables for dinner.

City people who get their vegetables from a huckster's wagon at the front door, or order their meals over the telephone, sentimentalize over the supreme joy of having home grown vegetables—and they are fresh and delicious. But Mrs. Coward had been up since half past four, had cooked an ample breakfast that was necessary to satisfy the appetites of her farmer men, had swept the big old-fashioned rooms and porches, had churned five gallons of milk, worked several pounds of golden butter, then carried it all down into the dairy, which instead of having a few strong steps, was reached by two jumps from one puncheon to another, with the pleasant prospect of landing on a snake at the second jump. So she was a little tired when she went out to gather the delicious vegetables which grew in such profusion as the result of her faithful hoeing and weeding, for the garden on some farms is the "woman's work."

Down the long rows of peas she travelled, picking the fine fat pods, full of pride that they had filled out so well. Then she gathered her apron full of snap beans, crisp and tender, then pulled up several bunches of beautiful onions. Over into the potato patch she plodded, the sun was beating down relentlessly on the old sunbonnet as she dug into the baked ground with an old two-tined fork and brought out the splendid "Early Rose" beauties, surely they were worth the trouble. It was like finding gold nuggets in the Klondike, and it was very exciting to see how many one could find in a hill, and whether they will be close to the top, or deep in the ground. It is interesting work, digging potatoes with an old kitchen fork, even though the sun is hot, and nobody has left enough wood to get dinner with.

Wagging along with her full dishpan, Mrs. Coward must go by the apple tree at the far end of the garden and get a few apples to make some dumplings, for farmer men must have a pie or something sweet to finish off with, and they liked nothing so well as the crisp, brown dumplings, with nutmeg and a butter on top, and a generous ladleful of rich yellow cream, even if they did always forget to leave enough stove wood to cook them.

Back in the house once more, she set about preparing the vegetables for cooking. The peas were shelled, the beans "snapped," the potatoes scraped, the onions sliced, and the apples peeled. All of the vegetables she put in pans and cov-

(*Concluded on page 1057.*)

Woman and Home

Waiting.

Serene, I fold my hands and wait,
Nor care for wind, or tide, or sea;
I rave no more 'gainst time or fate,
For lo, my own shall come to me.

I stay my haste, I make delays,
For what avails this eager place?
I stand amid the eternal ways,
And what is mine shall know my face.

Asleep, awake, by night or day,
The friends I seek are seeking me;
No wind can drive my bark astray,
Nor change the tide of destiny.

What matter if I stand alone?
I wait with joy the coming years;
My heart shall reap where it has sown,
And garner up its fruit of tears.

The waters know their own and draw
The brook that springs in yonder height;
So flows the good with equal law
Unto the soul of pure delight.

The stars come nightly to the sky;
The tidal wave unto the sea;
Nor time, nor space, nor deep, nor high,
Can keep my own away from me.

—John Burroughs.

*

The Crickets.

Pipe, little minstrel of the waning year;
In gentle concert pipe:
Pipe the warm noons; the mellow harvest near;
The apples dropping ripe.

The tempered sunshine, and the softened shade;
The trill of lonely bird:
The sweet, sad hush on Nature's gladness laid;
The sounds through silence heard.

Pipe tenderly the passing of the year:
The Summer's brief reprieve;
The dry husk rustling round the yellow ear;
The chill of morn and eve.

Pipe the untroubled trouble of the year:
Pipe low the painless pain;
Pipe your unceasing melancholy cheer:
The year is in the wane.

—Harriet M. Kimball.

*

"Unseen."

At the spring of an arch in the great north tower,
High up on the wall, is an angel's head;
And beneath it is a lily flower,
With delicate wings at the side outspread.

They say that the sculptor wrought from the face
Of his youth's lost love, of his promised bride,
And when he had added the last sad grace
To the features, he dropped his chisel and died.

And the worshippers throng to the shrine below,
And the sight-seers come with their curious eyes,
But deep in the shadow, where none may know
Its beauty, the gem of his carving lies.

Yet at early morn on a midsummer's day,
When the sun is far to the north, for the space
Of a few short minutes, there falls a ray
Through an amber pane on the angel's face.

It was wrought for the eye of God, and it seems
That he blesses the work of the dead man's hand
With a ray of the golden light that streams
On the lost that are found in the deathless land.

—Author Unknown.

*

Milking Machines.

AS a rule there is not much poetry about machinery, but we have received the following little poem to accompany the picture given here. As a good companion to it we print the statement of the crippled milker which follows. Machinery which enables defectives to do a full job may be said to have brains and sentiment.

The Machine Milk Kids.

Us kids is raised on "machinery" milk,
An' we guess it 'grees wif us,
For Pa he says we're slick as silk,
An' free from all bacterius.

When out to the barn with Pa we go
It's the mostest an' bestest fun
To hear our Pa say, "So-Boss-So,"
An' get the "machinery" already to run.

The bossies stan' as still as can be,
An' never widdle an ear or a hoof,
An' Pa he looks roun' to see,
If the engine's a runnin' wif a woofity-woof.

An' when we come back to the house from the barn
An' the separator "chine" 'mences to hum,
I tell you we're glad that we live on a farm,
It's the greatest and most bestest of fun.

The Hosley Twins, John and Kate, and their baby brother Truxton.

*

Machine for Disabled Man.

FEBRUARY 13, 1912, while feeding a corn-husking machine, I was unfortunate enough in getting my left hand caught in the rollers, crushing it so badly it had to be taken off back almost to the wrist joint, leaving only a stump. At that time I was caring for 16 head of cattle, doing my own milking, as competent help was hard to get. While in the hospital I decided to sell my cows as soon as I could, but while there noticed a milking machine advertised. I wrote for price and all particulars. Finding this machine reasonable and the firm agreeing to stand behind it, I decided to have one installed and by the last day of April,

ALL RAISED ON MACHINE MILK.

1912, had one working. I have been running one ever since without any trouble and very little repair, and have cared for more cattle since having the machine than ever before. Being slightly afflicted is no reason why a person cannot continue with the dairy much easier than the old-fashioned way of hand milking.

OTTO G. NEWMAN.

*

THE greatest advantage that life can ever give you is the knowledge that you have never taken an unfair advantage of any human being.

*

WABAUNSEE CO., Kansas, gives school credit for "sleeping with the windows open and going to bed before 9 o'clock." The school superintendent of that county is a woman—Annie G. Crouch. If this is a sample of her superintendence we would like more of it. Why should not the office of school superintendent naturally fall to a woman?

*

"THE high places now occupied in the minds of the American people by the warrior, the politician, and the literary man are due to the prejudices of Greek culture of 2,500 years ago." That is what a Columbia college professor told the students at the Kansas Agriculture College. We knew the prejudice was old and deep rooted, but it is slowly wearing out. Every mother and every teacher who puts truer ideals before the children helps "change the subject."

*

WE find the following in an English paper:

A scarecrow of the ordinary type placed in Mr. Howard Wilson's cornfields having failed to frighten the birds, was replaced by a feminine figure with a low-necked blonse, slit skirt, and plumed hat. Crows have now ceased to haunt the locality.

Those crows were wise, but the farmer did not know his business. It was not necessary to involve the higher household law in this way, for tar or arsenate of lead on the seed would have more than satisfied Mr. Crow.

"MAN works from sun to sun but woman's work is never done." How many hours does the farmer woman work? In California the Farmers' Protective League has figured the following from the records of 145,154 male workers:

1,675 or 1.5 per cent. worked 12 hours.
950 or 0.9 per cent. worked 11 hours.
18,115 or 16.8 per cent. worked 10 hours.
46,627 or 43.2 per cent. worked 9 hours.
39,532 or 36.6 per cent. worked 8 hours.
1,051 or 1.0 per cent. worked less than 8 hours.

Now we would like to know how much of a working day the woman on the farm puts in. Will you give us a report of your own hours of labor and also of your neighbors?

*

THERE was something of a flurry in Kansas over the "age question" for women who desired to register. Kansas women now have the right to vote. When they came to register some of the officers insisted upon asking their age—probably as part of a plan to keep them from registering. The Attorney-General of Kansas came to the aid of the women with an opinion in which he says:

"All the Constitution says on the question of the age of voters is that they must be '21 years old and upward,' and where that venerable instrument exacts no further particularity an election officer need not let his zeal run away with his courtesy nor forget that registration of voters is only to prevent fraud and not to give some official factotum the right to embarrass the new voters with irrelevant questions.

"Perhaps I ought to add that even if the voter has not yet attained the age of 21 years but will reach that age on or before the November election day such voter is entitled to registration for the primary. Only in such cases need the registration officer particularize as to the age of any person seeking registration further than to set it down that she is over 21."

*

AS respects suffrage, would it be fair or desirable that women, unable to serve as soldiers or police to enforce the laws, should have an equal franchise with men, who are able? E. S.

One of the arguments raised against giving the vote to woman is the statement that she could not fight as a soldier in case of war. France is now at war with Germany, and every able-bodied man has been called into the army. The harvest was left ungathered. Now the premier of France issues the following appeal:

"The grain stands unreaped, and the time of vintage approaches. I appeal to your hardihood and to that of your children, whose age alone, not their courage, withholds them from the fighting line.

"I ask you to maintain the lives of our fields, to finish this year's harvest and to prepare for that of next year. You cannot render greater service to your country."

This work of the women will be as helpful to France as that of the soldiers at the front. There is a famous old painting entitled "War." In a retired valley an old, white-haired man is holding a rude plow which six women and girls are pulling at the end of a rope. The girls show terror on their faces—the old man a dumb sort of despair. It is a fearful presentment of the hideous side of war which is thrust into the home. The burdens of such brutal strife are always hardest for the women to bear.

HERE is a sample of many notes which we receive:

Will you tell me the address of the girl in Fig. 391? I think I know her, and would like to write to her if I could get her name and address through THE R. N.-Y. F. J. H.

Now imagine for a moment what this means. The picture mentioned came to us from an entire stranger. We do not know "F. J. H." or where he lives, for he neglects to give his address. We could not print the girl's address, nor would we give it, if we had it, to any unknown correspondent. In cases where such addresses are desired our plan is to send the request right to the persons interested and leave them free to answer or not as they see fit. In one case more than 50 people wrote for such an address. We followed the plan mentioned above, but some of these questioners were inclined to find fault because they did not receive an immediate reply. They could not reasonably expect a man who had only one thing to offer to take time from a busy life to answer 50 letters at once. THE R. N.-Y. tries to answer letters promptly. The editorial department alone answered 12,342 questions up to August 15, but our plan is to leave our reporters and friends free to handle their own mail.

*

ONE of the best points made by Tom Barron in his talk before the Connecticut Poultry Association, was the tribute he paid to his wife. It seems that Mr. Barron, 20 years ago, was a shoemaker, and that when he was married he had but a very small income. He found that this income was not large enough to take care of a family as he wanted to care for his wife, so he went to Mrs. Barron and talked over with her his plans for developing his hen business. He said it is very largely due to her sound advice, and practical help, that he was ever able to make his start. It means a great deal for an English workman to start with nothing and accumulate enough to buy 20 acres of good land. That can be done with reasonable ease in this country, but in England the job is very much harder, and Tom Barron took pleasure on the platform in giving a large share of the credit for his success to Mrs. Barron. The people in the audience were greatly pleased with this statement, for you cannot get a group of successful American farmers together without finding a large proportion of them who know that their success is also due to the wise counsel and practical help of their wives. Some men know this, yet do not like to admit it. It was a great satisfaction and pleasure to have Mr. Barron so clearly present this family obligation to the silent worker at home.

The Horrors of War,

PROF. THOS. H. DICKINSON, of Wisconsin, would use the motion picture show to make the people realize the horrors of war:

"In the hands of the producers there is to-day this great social opportunity. You motion picture men, tell us not only the latest news from the front, but tell us the awful truth of War. Stop 'The Adventures of Matilda,' and 'The Romance of the Handsomest Star.' Let us see on the film the actual horrors of war, the devastation, the ruined homes, the retarded plans, the harvest fields laid waste. Let us know by seeing before our eyes that war is not ideal glory; it is murder and maiming of men; it is rapine and theft. It is not glorious crime; it is the multiplication of individual sordid crimes; it makes citizens murderers, and men into brutes. Let us see these things before our eyes that we be no longer misled with heroic lies. You can dispel the illusion of war among the millions of America."

*

A STRANGE ACCIDENT.—The newspapers report that in early April a woman in New York took her baby up to the top of a high building, put it in a baby carriage, and tied the carriage as she thought securely to the post. Then having provided this fine sun bath for baby, she went back to her work. A high wind arose and swept down through the street and across the top of this building with great power. It blew so hard that it broke the rope with which the carriage was tied, and blew the carriage with the baby off the roof. It fell six stories, and was instantly killed. The best place for a baby, as well as for most of the rest of us, is down closer to the ground.

No More Stove Wood.

(*Continued from page 1055.*)

ered them with water, exactly as if she were going to cook them, and then she set them all on a table in the sun, for there was no stove wood to make a fire to cook them with. She then set the dining table, filled the pitchers with milk, cut the bread, and sat down to wait for 12 o'clock. In the field the work was going on also, the mowing machine whirred, the hired man clucked cheerfully to the horses as he drove the plow down the straight rows of corn, "laying it by," and all the time breakfast became a thing of the past, and dinner a fast approaching reality the sun climbed higher and beamed hotter, and the farmer men listened longingly for the summons to take out the horses for dinner—even though there was no stove wood left to cook it with.

Twelve o'clock came and Mrs. Coward blew a blast on the dinner-horn that sent the waves of hungry anticipation rippling all over the farm. Machinery stopped, chains rattled, horses were driven merrily up to the barn and fed, and up to the house trooped the hungry farmer men ready for one of Mother's big dinners—even if there was no wood cut to cook it with.

Into the kitchen strode Mr. Coward to get the "washpan" in which the farmer men are accustomed to bathe their sunburned faces, and something strange and chill struck him. No fragrant odors of boiling beans, of stewing peas, of baking apples greeted him, only a placid old lady, whose heart was quaking, and whose knees were shaking beneath her "wrapper," at the enormity of her revolt.

"Why Nancy, what's the matter, where's the dinner, I thought you blowed the horn, ain't it twelve o'clock? Where's the dinner?"

Mrs. Coward lead her gaping astonished "man" to the table in the back yard where the sun beamed down on the uncooked vegetables, and mildly said, "I set it in the hottest place that I could find, Jim, there was no wood cut to cook with."

Mr. Coward said never a word, nor smiled a smile; it is a dangerous thing to fool with a hungry man. That was the quietest meal that was ever eaten in that house. The hungry men made out the best they could on bread, and butter and milk, and Mrs. Coward's heart almost misgave her as she thought of their disappointment, but she made no apology, the situation was a serious one.

Before those men went back to the field, there was a generous pile of wood in the box behind the stove, and there was such a supper that night as loosened the

MOTIVE POWER FOR DINNER.

tongues that were tied at dinner time. And never again did Mrs. Coward have to pick up chips, or cut a stick of stove wood to cook a dinner. Her men folks could take a hint when it was shouted at them.

Woman's Work.

THERE seem to be queer ideas in some places on the man's part in the home; some fathers seem rather useless except to pay bills. I have always thought it was a man's part to do the heaviest, hardest things about the home, when he was there. Father always does and has. Yet my maid (on a week's trial) was seriously disturbed and came to me about father's filling the woodbox.

"It doesn't seem right to see your father carrying wood. It seems as if I ought to take it right away from him," she said. "My father never liked to see the woodbox empty or the water pail either when he got home."

Father is a natural born gentleman and his women folks have never been strong. Over at the tenant house on washing days, I have sometimes seen the mother of eight carrying her own water from the well, with most of her seven sons lounging around. As the sons range in age from two to 22, not much can be expected of the younger three. Yet when the well went dry, water was carried by the mother and daughter from a distant brook. The tenant-house sons are doing just what they have always been doing, and apparently it never occurs to them to do anything else. S.

"Good Reading"

Stories and Studies

The Two-legged Peter.

LULA BENT, aged 20 years, boarded cats, and her mother, a widow, left with little money but a large country house and a family of six, boarded anybody. Mrs. Boucher, a city dame of

"HE STAYS OUT NIGHTS."

French descent, motored out to see the Bents, and asked them to board her cat, Peter, and her grown son, as she was going to Paris for the Summer.

"Now, Miss Bent," she said, "you must kiss Peter every night before you put him to bed, for he always kisses me, and I do not wish him to break off that affectionate habit. He must have ice cream occasionally, salads, baked beans, and cream of tartar biscuit only."

There were many other instructions regarding Peter, his nap, his bath, and so forth. All that she said about her son was that he was queer and literary and difficult to understand. Mrs. Boucher then bade her cat a tearful good-bye and coldly took leave of her son. The younger members of the Bent family heard her address the latter as Peter. When she had gone, Peter, the son, overheard these children say to Lula:

"Are you going to kiss that homely thing every night?"

"I'll kiss the other Peter first," she answered. And Peter, the son, was amused, and did not blame Lula a bit, for he did not share his mother's inordinate love for cats.

At the end of the Summer Mrs. Boucher, having returned from Paris, motored again to the Bents to get Peter. Her sister accompanied her. Everybody at Bents had gone out but little weak-minded Mary, aged five, who sat rocking herself upon the veranda. Mrs. Boucher and her sister were glad to take seats in the pleasant, breezy spot.

"How's Peter?" inquired the former of Mary.

"He's fine," was the reply.

"Do he and Miss Bent get along well?"

"Oh, yes," said Mary; "she loves him and he loves her."

"What's Peter had to eat?"

"Oh, Lula makes everything he likes," said Mary, "leap-year cake, diplomatic pudding, angel cake, and all these things."

"Oh!" ejaculated Mrs. Boucher. "Well, I'm glad she's been so good to him. I always give Peter a taste of everything that I have."

"Where does he sleep?"

"In the guest chamber." (Mrs. Boucher manifested some surprise.)

"Does she give him a bath?"

"No; he takes it himself, but she gives him the towels."

Mrs. Boucher and her sister exchanged looks, and the latter remarked:

"I guess it's the two-legged Peter she's talking about. You'd better inquire about the other and see if he's fared as well."

"Where's my cat Peter?" inquired Mrs. Boucher.

"I don't know. I guess he's on a spree. He stays out nights, and he goes into Mrs. McCarty's garbage-can—they have scarlet fever there; and he eats grasshoppers and kills snakes, and he eats cockroaches, too. I guess I can get him if you want him."

"Well, I want him."

Mrs. Boucher and her sister indulged in a *tête-a-tête* when she was gone. They helped themselves to some newspapers lying on a table in the corner of the veranda, so that they could wrap them around Peter, who had been frequenting such questionable places.

"My poor Snooky-ookums!" said Mrs. Boucher when Mary appeared with Peter. He had a black nose, acquired by searching in somebody's coalbin, paint on his legs, a knot in his tail for bad behavior, and instead of his pretty red collar, a string, with an old cigarette picture for a bangle around his neck. She managed to carry him to the automobile, and away he went, back to his aristocratic home. After their arrival, and Peter had been bathed and fumigated, and made to realize that his wild life was at an end, Mrs. Boucher sent the following note to Lula Bent:

"DEAR MISS BENT: It does not seem to me that my cat has received just the treatment that I desired, but I believe that you have done well by the two-legged Peter. Please tell him to pay the bill.

"Sincerly yours,

"CONSUELO BOUCHER."

She received in reply a note from her son:

"DEAR MOTHER: What you term 'neglect' of Peter—but which, I dare say, he realized was freedom, delectable—has certainly been made up for by the treatment accorded the 'two-legged Peter,' who, for the first time in his life has been shown some consideration. I'll gladly pay the bill, and Lula's going to keep me.

"Yours ever lovingly, PETER."

J. C. M'BAIN.

Neighborly Chat.

"THAT is the most delicious cherry pie; how do you get such a fine pastry?" asked Mrs. Barnes, as they cleared the table.

"Oh, I always make the crust the day before I need it, and put it in the ice box. It really is an improvement. No, Mrs. Barnes you'll not help with the dishes. I am going to enjoy your visit—we'll go on the veranda. The dishes will not run away," she laughed.

"Have you been reading anything especially interesting, Mrs. Hayden?"

"Well, really not much, other than the papers. Do you know I am interested in the English women's fight!"

"Are you? I attended a lecture a few weeks ago, and the speaker said he

COOKING (?) DINNER IN THE SUN.

thought it not so much a 'woman's question,' as a fight for liberty—the same old struggle that has marked English history from the days of the barons. As we were coming out of the hall, a few boys shouted: 'Look at the old hens.'"

"Well," laughed the listener, that was not such a bad name either. I made $150 last season on eggs and young fry. No, I don't sell by pound; just charge 50 cents apiece, and 10 cents extra if I dress them."

"That is Aunt Emma's method, too. By the way, I wish you could have seen her lawn this Spring. Last Fall she tried a new way of setting out her tulip and hyacinth bulbs. Instead of putting them in regular flowerbeds, she scattered them over the lawn. You can scarcely imagine how beautiful was the effect. The lawn dotted with the various colors. Of course, when they were through blooming, you could not tell that the grass had been 'flowered' at all. Aunt Emma said that all Spring she felt that the fairies were hiding in the tulips!"

"I am certain the effect was lovely. I think I'll try that method next Spring. I must go, though I do wish I could remain longer." M. E. D.

Antidote for Snake Bite.

CONSUL-GENERAL JAMES A. SMITH sends from Calcutta, India, an account of a treatment for snake bite. In 25 years venomous snakes killed 543,991 humans and 187,436 cattle.

"The mortality from snake bite among the poorer inhabitants of India is due in part to their habits and mode of life. Many sleep on the ground in their houses, the walls and floors of which often give cover to snakes. Persons are sometimes bitten by serpents which crawl over their bodies in the dark and are perhaps irritated by some unconscious movement of the limbs during sleep. In such cases the reptile is seldom seen, and there is a dreadful doubt as to whether a rat, a mongoose, or a deadly snake has caused the wound. During the great heat of the plains in Summer scanty clothing is worn and many people go barefooted, while those who do wear shoes seldom wear hose, thus leaving the ankle and instep exposed. Many fatal cases of snake bite occur among natives engaged in cutting grass when the vegetation is dense and capable of concealing even a panther. The native squats down on his heels, grasps a handful of grass, and cuts it off near the roots with a curved hand scythe, and often touches and irritates hidden reptiles."

An antidote for the poison is now made from the snake's venom, and the plan is thus described:

"A couple of Indian assistants dragged forth a tin box, the lid was lifted up, and an angry cobra disclosed. It expanded its hood and swayed its wicked little head from side to side, hissing like a steam engine. One of the Indians with remarkable dexterity seized it firmly at the back of the neck, at the same time placing his foot on the end of its tail to prevent it from coiling. The cobra, being thus harmless, was carried forward, and a wine glass with a piece of American cloth covering the top was placed near its head close to its darting tongue and glittering eyes. At once it struck, its two sharp upper fangs pierced the cloth, and the deadly poison dropped into the glass. There was perhaps half a teaspoonful in the glass, sufficient to kill half a dozen human beings. The cobra was then forcibly fed with egg flip through a tube and put back in his box hissing ferociously, and was then left for 10 days to mediate on the indignity he had suffered. The venom is extracted only once in 10 days. The venom is dried over lime and sent to Kasauli, where it is dissolved in a salt solution. It is then put into a horse, only a small dose being given at first. This is gradually increased until at the end of two years the animal can stand a dose 200 times the original one, since it acquires immunity from the poison."

As Others See Us.

TOWN LADY: (fanning languidly while waiting for dinner at the boarding house): "Is it really true that farmers' wives have such a hard time? It seems like an ideal way to live. No cost, you know."

LITTLE COUNTRY SCHOOL TEACHER (attending the institute and boarding for the week): "Only two classes of farm women have a very hard time."

TOWN LADY: "I thought so. I believe all this talk is greatly exaggerated. I don't see what our women's magazines give space to such stuff for. What two classes do reely have a hard time, Miss Gray? You know I find it real interesting to get your point of view?"

L. C. S. T.: "Those whose husbands are ambitious and therefore prosperous, and those whose husbands for various reasons are not prosperous, but who are ambitious themselves."

T. L.: "Ambitious! My land! I didn't know ambition applied to low pursuits like farming."

L. C. S. T. (a little exasperated): "The point is that those two classes take in every farm woman. Whether they have a right to be ambitious——"

T. L. (interrupting): "Oh, la, don't get excited. I'm sure I don't know anything about it. There's the dinner bell. Isn't the fare here the poorest?"

IDA EARLE FOWLER.

:: Household Management ::

How Busy Women Plan

How Busy Women Plan.

STANDARDIZING THE WORK.—Not being very strong and having a great deal to do, with four children from one to nine years old to care for, besides the regular work of a farmer's wife, it has been necessary for me to arrange my work so as to get it done as quickly as possible with the least amount of effort. I have my work systematized, for that is the only way to accomplish a good deal in a little time, I think, having certain days for doing certain things. Of course sometimes sickness or other things prevent certain work being done at the time planned, but usually it only takes a little time to get caught up to the old schedule.

How It Is Planned.—In order to show you how I plan my day's work I will have to begin with the night before. I put the two younger children to bed right after supper, which we have at half past five, wash the supper dishes, put the other two to bed at seven o'clock (they have been taught to undress themselves since they were four years old, with mother unbuttoning them down the back) so it only takes a few minutes to listen to their prayers and tuck them in bed. I then set the table for breakfast, putting the cereal on to cook in fireless cooker, if it is in the Summer-time (for all raw cereals are better for being cooked over night as my doctor told me when I first began to feed my children). We burn wood in Summer; if it is in the Winter cereal is put in the double boiler on back of kitchen range and is all ready to use in the morning. The coffee is measured and put into the coffee pot with cold water, and when my husband goes down in the morning he opens the draft, if it is a coal fire, starts a wood fire, as the case may be, and sets the coffee on to boil. The children generally wake up about the time we do and all are dressed before breakfast, except baby, who has a little wrapper slipped on over his night clothes, until after breakfast.

The Breakfast.—I do not bother with meat and potatoes for breakfast, but generally have bread rolls heated in the oven, or toast, with soft boiled or poached eggs— these being good for the children and quick to fix—the two important considerations, for as everybody knows, an hour in the morning seems worth two in the afternoon to get things done.

Wash-day.—Monday, as soon as I go downstairs, I fill boiler with cold water and a full bar of borax soap shaved up fine and put in the clothes. By the time breakfast is cleared away, dishes washed and baby attended to, the clothes have boiled enough and are about ready to put into rinsing water. Clothes done this way require practically no rubbing, as I poke them well while boiling. They are put into washing machine, which is turned three minutes, then the water drained off and the machine filled with clean water. There is a wringer attached to machine, so that it does not take long to finish the washing. Doing it this way white clothes are easier to wash than colored, so the children and I wear white ripplette nightdresses and petticoats in Summer, and white outing flannel in Winter. The other underwear for myself and the girls is gauze and the boys and my husband balbriggan, as that is the cheapest and the easiest to wash. I say "cheapest" because I think it gives the most comfort and wears the longest. Of course underwear made at home might cost less, but I would rather take the time it would take to make the underwear to work in the garden and with my chickens, for the returns are greater both in money and in health.

We use bath towels (Turkish toweling) upstairs and for the kitchen brown homespun linen (that is the name they go by and they are only 12 cents apiece and last longer than any other towel I ever had) as they don't require any ironing, but are folded as taken from the line.

Other Labor Savers.—I use sheets instead of spreads for the beds, as they are so much lighter to wash. So many people use a colored quilt instead of a spread, but I do not like to do this, as I think it is much healthier to have all the bedclothes as clean as possible, and of course spreads are much easier to wash than quilts. For six or seven months in the year I do my washing on back porch, which is toward the south. I have a large tin funnel (costing 10 cents) fastened to the end of a piece of garden hose with wire, which I tie to the pump at kitchen sink, so that I can fill the tubs without carrying the cold water. The two older children think it great fun to fill the tubs with water, which helps me quite a little. The drain for emptying the water is put at the end of the porch. My cooking I make as simple and easy as possible by using my fireless cooker and in the Summer an oil stove.

Caring For The Babies.—Except in the coldest Winter weather I give the two younger children their nap out of doors, one in the hammock and the other in what I call his daytime crib, which is really a big packing box on castors, lined with denim, with a folded heavy quilt in the bottom. This crib saves more steps and time than any other one thing, for the baby spends practically all his time in it. Two sides of the box have window screening set into it so that when he is sitting up he can watch the other children playing. I also give him a few things to play with. This keeps the house from being cluttered up so, as well as keeping the baby's clothes much cleaner than if he was creeping around the floor. Then when I have a few minutes to spare I can run up and make the beds, which always have a good airing.

The Children Help.—Another thing, I have always insisted on the children helping me in the house, the boy as well as the girl, and it certainly is surprising how many steps they save mother. It is all done for love, and sometimes when they grumble about having to do so much more than some of the neighbors' children a little talk about the part they can take in the world when they are big, and about some of the well-known men who started in as farmers' boys, will renew their interest and make the work go easier. The two older children help in the garden and with the chickens, these latter being very little trouble except for the first two months, and even then I have everything arranged in the most convenient way so that it does not take long. I have always had good luck with my chickens, and make considerable money from the few I have, but I will not go into my methods here, as it would take too much space. MRS. F. B. T.

THE YOUNG GARDENER SHOWING MANAGEMENT.

A Few Good Stews.

THAT delectable vegetable stew.—Did you ever eat one? Then you don't know what you have missed, for they are certainly delicious as well as wholesome, and will help reduce your meat bills, for if you have one of these stews for dinner you will not need any meat. There are a great many combinations that can be made, depending chiefly upon what you have in the garden or can get. I will give some of the combinations which I have tried: Potatoes, onions, carrots, tomatoes, parsley, string beans, thyme and peas. Cut all but the last named vegetable in small pieces and put them together in one large kettle, covering them with hot water, allowing the usual time for cooking the various vegetables, so that they will be properly cooked at the end. Fifteen minutes before dinner time put in salt and pepper and a large lump of butter, and then thicken the water (which should have slightly boiled down) in the pot with flour, so that it makes a rather thick gravy. This is then served on a large platter.

Other combinations are as follows: Tomatoes, onions, Lima beans, peas, parsley, corn (cut off the cob—that left from the previous dinner will do), lettuce and a little sage and rice—this latter, of course, being first cooked in a double boiler until soft, and then added to the other vegetables when you add the butter and flour.

Another is cabbage, beets (these are cooked separately and added at the last) tomatoes, onions, corn, turnips, celery and barley—this latter is cooked the same as the rice. Sometimes I add a couple of teaspoonfuls of Worcestershire sauce to the stew to give a little different flavor to it, and nearly always I put a greater portion of tomatoes to that of any other vegetable.

Occasionally I make dumplings to go with the stew, or put in noodles or macaroni. The former are made as follows: Two cups flour, two teaspoons baking powder, one-half teaspoon salt sifted together; then add enough milk to make a stiff batter. Drop a tablespoonful at a time on the top of the vegetables, put on the cover and let cook *without raising the cover* for 20 minutes or half an hour. Of course, when you make the dumplings you have to put the butter and flour in half an hour before dinner, so as to allow time for the dumplings to cook. I always put an asbestos mat under the kettle so that the vegetables will not burn while the dumplings are cooking.

If it is desired to make the stews more hearty a little meat can also be used. Bacon or salt pork cut in small pieces and fried, then put into the stew and their grease used instead of butter is very good. Beef may be used, but, of course, should be put on in hot water over a slow fire, for at least two hours before the vegetables are put in.

While on the subject of stews I might tell you about macaroni stew, of which my husband and children are very fond, as I have never met anyone who made it exactly as we do. I get two pounds of beef, soup meat, as in our town that is three or four cents cheaper than stewing meat and answers the purpose just as well, and put it on in hot water where it will cook slowly for two or three hours (I always do the latter as it makes the meat more tender). Cut up three or four onions and a few sprigs of parsley if you have it and put in with the meat. Cook half a package of macaroni in salt water for 20 minutes, drain, and half an hour before dinnertime put in with the meat, also adding half a can of tomatoes. Let this all cook together for a short time; then thicken the gravy with flour. Serve all together on a large platter.

MRS. A. E. T.

A Woman's Home Management.

MRS. W. B.'s problem is mine also; to manage the home successfully, care for a family of small children and find time for poultry and garden. I have not solved the problem—has anyone?—but there are "short cuts" I have learned from trying and will suggest these while I wait to hear from others.

My greatest saving of time and labor comes on the ironing. Every garment possible is taken from the line, folded and put directly away. This includes towels, sheets, pillow slips, nightgowns, stockings, knit underwear, etc. Only such as cannot be used without are ironed. They are very sweet and clean this way, and need offend no one. Most especially is this a saving with the wee folks who get soiled so remarkably often.

My next greatest saving is on hand sewing. Garments are made and mended just as far as possible on the machine. Children's underwear can be made entirely without hand sewing. Measure the band and pin in three or four places. Lay tiny pleats in the garment and hold with one hand, stitch the band first on the wrong side and then turn and stitch down neatly on the right. For buttonholes, stitch around three times and cut through the center. They will outlast the band. Several small garments can be made in this way in a short time. Choose simple patterns, they are always prettiest, and simple trimmings. Here again one saves on the ironing.

Sweeping and dusting can be cut in half by having painted floors with small rugs and by packing away unnecessary dust catchers. A chicken wing is nice to dust with and works faster than a cloth.

For cooking choose simple recipes that are liked by all the family. Save the more elaborate dishes for holidays, birthdays, etc. They will be much better enjoyed too, if served only occasionally.

I find it best to do my sewing as far as possible in the Winter months when gardens cannot be worked and poultry does not need so much care. On rainy days through the busy season I mend and bake, on very hot days I "go slowly," and bright, cool days which stir one's ambition, I devote to outdoor work. There are a few things we must learn to overlook. One is the housekeeping of our neighbor who has no wee folk. Let us not take it to heart because her house is so "spick and span," her work always done up early and herself cleaned up and working eyelets on the porch. If we can keep our little ones well, our home comfortable and every one happy and help a little with the income, we need not worry. Let the children play on the floor, the cat lie in the chair, and "John's" wet boots and mittens repose in peace on the kitchen stove.

New York. MRS. NILES GROVER.

Sewing on a Button.—It seems that science has crawled through the button hole. Miss Annabell Turner, instructor in home economics at Wisconsin tells hows to do it. "Take a small stitch, bringing the knot on the right side. Run up through one hole of the button and draw it down just over the knot. Lay a pin across the button and work the stitches over the pin. When the button is firmly sewed on remove the pin. Pull the button out from the material and wind the thread around the threads between the button and the cloth several times to form a shank. Pass the needle through to the wrong side and fasten the thread with several small stitches. The shank formed makes buttoning easier and lessens the strain on the cloth. The knot is brought up on the right side and under the button to keep it from being worn off."

The City Housewife's Problem.

THE food question does not greatly trouble the farm housekeeper who has access to a good garden and orchard, a cow and a yardful of chickens. It does loom large to the city housekeeper, and her country sister will be interested in knowing what becomes of the floods of food which start for the city. A writer in the New York *Sun* speaks of the outcry over the high cost of meat:

Yet there are hundreds of tons of the finest vegetables grown that are selling for less than freight charges, and consumers don't seem to want them, or else they don't know that present conditions exist. Just think of it, green peas are selling at 10 to 30 cents a bushel bag. These peas will shell out at least six quarts to the bag. Jersey tomatoes are selling at 30 to 40 cents a bushel crate; cantaloupes are 30 to 60 cents a crate of 45 to 60 count, while the crates containing 100 melons are seldom bringing over 75 cents. The writer pays 20 cents for half of one of these melons in a small restaurant in the very centre of the market. Assuming that these cantaloupes cost $1 a crate the restaurant gets a profit of $16 to $18 on one crate of melons with an investment of $1.

Much the same is true of beans, lettuce and other foods. When it comes to poultry this correspondent says:

We have an abundance of dressed poultry, frozen last year, at a cost of 18 to 22 cents a pound, and now wholesaled at three to four cents less than the cost price last Fall and Winter. We received and unloaded 116 carloads of live chickens, numbering fully 650,000 head. These broilers and fricassee fowl are used almost entirely by the Hebrew housewives. The wholesale market on broilers was 17 to 18½ cents, while fowl sold at 14⅞ to 16 cents. Consumers get this poultry at two cents per pound over wholesale price.

This fearful waste goes on week after week largely because the machinery of distribution is defective.

If there was some agency by which intelligent housekeepers could find out what is being produced and on the present market the high cost of living would be the least of their troubles. Newspapers are teeming with accounts of the high cost of foodstuffs, and at the same time hundreds of tons are going to waste because consumers don's ask for it. Consumers pay no attention to anything until they read it in the newspapers.

It is a fact that most city buyers rarely think and investigate for themselves. They are guided almost entirely by what the newspapers tell them. If half the space now given to guessing at the war news were devoted to telling city people how and what to buy as food both the consumers and the producers would be far better off.

Odd Things About Poison Ivy.

YOU say it's a new one to you anent goats and poison oak or ivy. Perhaps it may further surprise you to learn that the omnivorous goat is not the only animal with an appetite for that vicious plant. At least it did me when I first came to the camp. The dairyman, who is an expert stockman, said that horses considered the tender leaves and sprouts a great delicacy, as did other stock; that it was a remedy for colic in horses and that when colicky if on range they would hunt out and eat the plant more than at other times; furthermore, that lumbermen in this section and also stockmen and others who are liable to come in contact with it secure immunity from the poison by occasionally eating a handful of the tender leaves of the plant. Proving his words he reached up into a wayside tree and brought down in his bare hand some sprays of the poison and passed them to his team.

Our camp, as a part of the great redwood timber country of the State, is headquarters for poison oak. It seems to take a fiendish and almost human delight in "soaking it to" the city tenderfoot who overruns the solitudes each season. Here near-tragedies are enacted. Two Summers ago a couple of nature-hungry youths from the city took in the camp. One of them became so badly poisoned that from the top of his head to the sole of his feet his flesh was like a boil. He couldn't bear even a light garment and for several days, naked and suffering, swearing and groaning, he was a prisoner in his room. There are as many remedies as victims and if used in time any of them will prove effective; but after the poison gets into the blood it will run its course and the best one can do is to apply some palliative to ease the intolerable itching and burning. For this purpose the hot water treatment is most effective, followed by a thick dusting of medicated powder or baking soda while the skin is wet. Wormwood tea used internally as a tonic and externally as a hot application is said to be very efficacious. It is an excellent practice to fortify the skin by an application of cold cream or any sort of grease with a dusting of talcum powder or starch before going on a tramp. This also protects the skin from insect bites and sunburn. A rind of bacon is good to take along in case of contact with poison. I would suggest to your inquirer who wants something to kill the poison plant on his acre, that lacking a goat the best plan is to grub out the roots himself, or if he has not time, to go over the ground frequently with the hoe and cut down the sprouts. In that way I have about exterminated the pest from a wooded corner of my grounds.

California. M. RUSSEL JAMES.

Life Insurance Policy.

WHEN a man holds a life insurance policy, "Self" being the beneficiary, at death of insured, what claim would wife have on policy if there are no children living?

Where the insured himself is named as beneficiary, the insurance money becomes a part of his estate in the hands of his executor or administrator, and would be used in the payment of debts, etc., and be distributed the same as other personal property. The wife would have the same interest in it as she would have in respect of the rest of his personal estate, which in New York, if there were no children, would go, after the payment of debts, etc., one-half to the widow and the other half to the next of kin, such as brothers, sisters, nephews, etc., or if none of these, all to the widow. M. D.

Who Has the Title?

WHAT can be done to acquire possession of property of which no deed can be found on record, a son having lived on same until death and the widow continuing to occupy and pay taxes, having paid the taxes for 50 years? The other sons and daughters being all dead, can it be held by quiet possession or a bill for the taxes and interest? I am very anxious to get a title to same.

Maine. B. L. E.

You do not give the name of the person who last had a deed to the property. Presumably it is the father of the son whose widow is now on the property and the property, on the death of the father, descended to his wife, if then living, and his children, and they, and their wives and children are now the legal owners. If this presumption is correct, the way for your inquirer to get legal title is to buy out the interest of these heirs, or to get them to sign a quit-claim deed to her. Their interests would not be large, as they would have to pay their share of the taxes for the past 50 years. If the heirs can be got hold of they ought to give a quit-claim deed without any trouble or expense. If they cannot be found, there appears to be no harm in the present occupant giving a deed to a purchaser, although the purchaser would not have a legal marketable title. In a few words then, the present occupant, who has paid the taxes for 50 years, must acquire in herself the interest which the other heirs of the former owner now have, and the quit-claim deed signed by all of them would seem to be the simplest method. Inasmuch as she has occupied the premises claiming title as against all the world for 50 years, she may claim ownership by adverse possession, and might start an action joining all the heirs of the former owner as parties defendant, but this is quite an expensive proceeding and the former method is more simple. M. D.

A TRAVELLING TABLE.—Passing through furniture stores we note among modern conveniences tea-tables on rubber-tired wheels. These, although very convenient in some homes, did not seem to fit our need, which was to set table, serve meals, and handle dishes with the fewest steps and in the shortest time for a very large family, and besides they were expensive. We studied on it for some time, when the handy man of the family evolved the following: We had an old-fashioned table, which was originally a drop-leaf, but being choice wood had parted with its leaves for bracket shelves, leaving the bed and four legs. He took the top off, nailing three-eighths inch hard pine matched boards beneath the frame crosswise. The hollow bed thus made was then lined with zinc, reaching over edges to make waterproof, fitted, soldered and smoothed down at the corners. A fine set of ball-bearing castors with fibre cover, to prevent scratching, were added, then a coat of paint was applied to the wood surface. Now we have a table that can be moved by a touch of the finger. It will carry the whole dinner or dessert for a large family from kitchen to dining-room at one trip, or carry a bushel of soiled dishes from the table. CLARA T. SISSON.

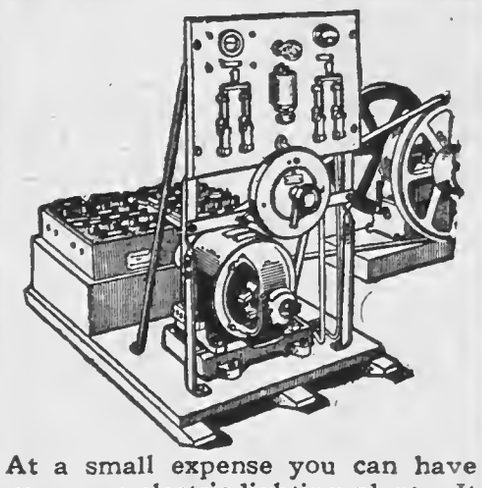
"IT NEVER RAINS BUT IT POURS."

About the best joke on Jim Crow, and it is true, too. We have a one-eyed farmer whose young chicks the black crows were catching for meals faster than was at all profitable. So, as it was doubtful if he could shoot a crow, he took down his trusty gun and went over to his grain barn, and sighting a common barn pigeon he blazed away, and down came the pigeon. When secured he next hunted up his good wife's stove brush and blacking. Soon the pigeon was as black as a veritable crow. This transformed dove-crow was then hung up in the chicken yard to scare away the chicken thieves—the crows—and proved to be efficacious. This is the first instance coming to my observation where a barn dove was used to scare away crows. It is well known that a dead crow hung up in a cornfield or chicken yard will keep crows away, and is a practice we often resort to.

New York. F. M. P.

R. N.-Y.—We have long heard of the "dove of peace." Here is a new use for her. She usually is a scarecrow.

Electric Lights In Your Home and Barns



At a small expense you can have your own electric lighting plant. It occupies only a small space, is perfectly safe and easy to operate. A complete plant is shown above.
The new
"Hyray-Exide"
ELECTRIC PLANT UNIT
gives you light day or night, makes your plant very simple and absolutely reliable.

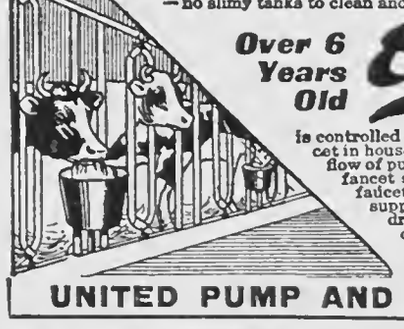
WONDERFUL FAUCET CONTROL
EVER-FRESH WATER SYSTEM for FARMS AND COUNTRY HOMES
Here at last is the perfect water system for farm and country homes—one that gives you all the pure running water you want fresh from the well just by turning a faucet anywhere about the house, barn or yard. No stale, stored water—no slimy tanks to clean and repair. No pump to freeze—no depending on wind or weather.



Over 6 Years Old
Everfresh WATER SYSTEM
Over 6000 Sold
is controlled entirely by the turning of the water faucets. Opening any faucet in house, barn or yard starts the Perry Pump and delivers a full steady flow of pure cool water at well temperature the year round. Closing the faucet stops the pump and it will remain idle until you again open a faucet. No waste, no bother—no stored water. One system will supply water hard or soft, hot or cold, for family, kitchen, laundry, toilet, bath and barn use. Easy to install, inexpensive to operate. No change in well or location of buildings required. Write for free catalog today.

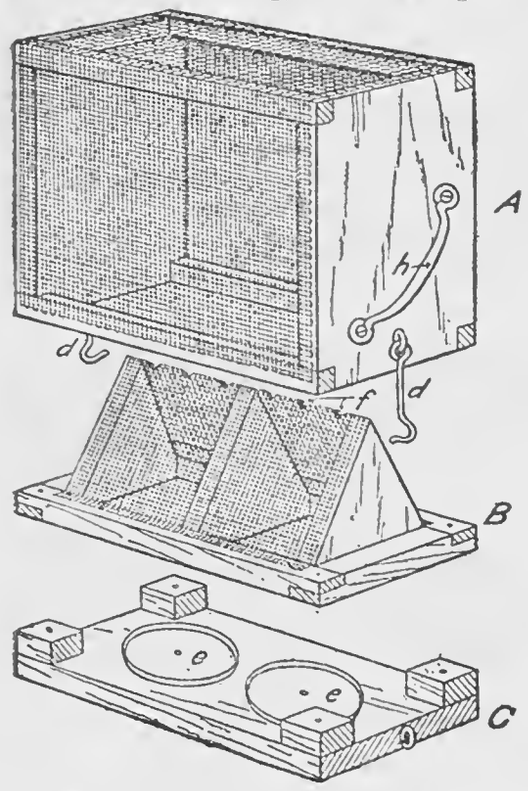
A Home-made Fly Trap.

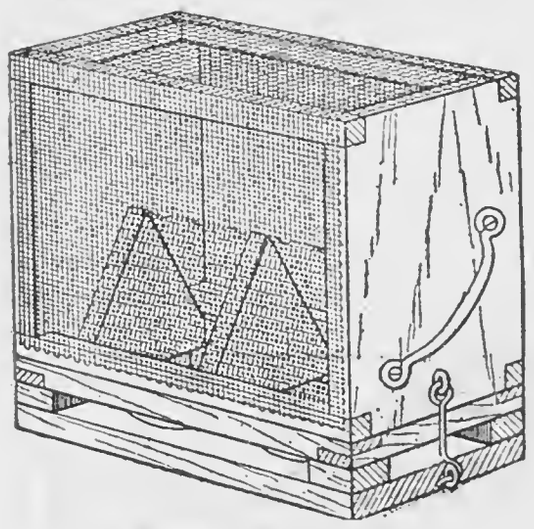
THE Department of Agriculture at Washington has issued a circular telling how to make a fly-trap for 20 cents or less. This trap was originally made in South Carolina, and was sent to the Department by one of its farm demonstrators. The picture shows what the trap looks like when complete, and the following statement is made of its manufacture. We should judge that this trap will give as good results as many of those for which 50 cents or a dollar may be charged. In connection with the use of chemicals in the horse manure, a number of these traps about the house will be quite sure to help. It is said that the Department's agents go about carrying several of these traps. They are set up in a farmhouse and the housewife sees at once what they will do and has the men folks make one or more. Here is a chance for some bright boy to make these traps and sell them:

These traps can be made any size to suit, but the most popular size in my work is 16 inches long, 12 inches high and



SECTION OF THE FLY-TRAP.

eight inches wide. Some are made as large as 24 inches long, 18 inches high, and 12 inches wide. The material for these traps costs from 10 to 20 cents, and can be put together by anyone handy with tools in a short while. The trap may be baited with sour milk, a piece of banana, a fruit skin, or similar substance. This should be removed at night or it will attract ants. At the same time the flies which have been caught should be killed by pouring hot water over the trap or leaving it immersed in water until the flies are dead. The flytrap is made in three distinct parts (A, B, and



THE COMPLETE FLY-TRAP.

C) that may be detached from one another by unfastening the hooks (d) that hold them together at either end. The trap is unhooked in order to place the bait on the bottom section (c). The bait is placed on two pieces of tin (e) tached to this bottom section. In the sample trap that was forwarded to the department these pieces of tin were circular tops of paint or milk cans, which can be removed by prying up with a knife. The middle section (B) of the trap consists of a screen-covered frame that resembles a small gable roof through which there are six holes (f) to let the flies into the uppermost section (A), which is merely the screened-in cage that is set down over the other two parts (B and C). The handle (h), of course, is unnecessary, but will be found convenient when the trap is immersed in water to kill the flies.

Toy Making at Home.

GERMANY has been supplying this country with a large share of the toys used by our children. Some of the German toy-makers have been bred to the business for many generations. The war will stop most of this toy trade, for though toys (even figures of soldiers) could hardly be called "contraband of war," most imports from the war countries will be held up. While millions of toys are made in this country there will be a shortage if the German supply is kept out. This will give opportunity for some skillful women to develop a little business. Children will demand playthings and dolls. Animal figures and many others can be made at home by women with quick fingers and good eyes. Twenty years ago we knew a family of women who made a good living and more at making such toys. Business developed in such a way that European toy-makers took up this business and made it unprofitable for the women. This destructive war may bring back part of this home trade.

The Business Gas Engine.

IN a recent issue you said you would like to locate some little gasoline engines that are doing work in the house. There are at least eight in this vicinity. I will tell of ours, as I believe it is doing more than any of the others. It is a two horse-power, costing about $45 with freight. We installed it 2½ years ago to run the cream separator and churn, also the washing machine, then we put a pulley on the ice cream freezer so as to run that by power, and next we rigged the sausage grinder to be run by it. We make about 140 pounds in the Winter and grind it through twice, which was hard work; now it is fun. The last thing we gave it to do was to run a generator connected with storage batteries, by which means we have a perfect electric light plant. The generator is always run when the separator and other work are being done, so have had to run the engine very little extra for the electricity. We haven't thought of any more work we can give it yet, but when we do we know it will do it. We think our little gasoline engine the best by far of any piece of machinery on the farm.

(MRS.) C. H. ELLINWOOD.

Different Grades of Goods.

I NOTE the letter by C., page 987, title, "The Local Storekeeper." There are so many grades and prices including genuine imitation, first, second, and third grades in goods under the same name that the local retail dealer cannot keep them all. Therefore he usually confines his purchases to firsts and mediums, hence a house which depends on a printer's ink description instead of sight and use can quote lower prices. He can claim that an article is steel, yet steel has values in different grades from four cents to 32 cents per pound or outing flannel, which has a value commencing at five cents, rising one cent to 18 cents, making 17 grades, or ladies' hats which have a retail value commencing at five cents, costing at wholesale 45 cents per dozen, made from peanut straw, and advancing according to grade to $125 per dozen for one grade of fine panama which retails for $15 each. Or eggs, which are quoted in a New York paper today at 28, 26, 25½, 24½, 22, 20, 32, 33 and 31 cents, making altogether nine grades. Butter is quoted at 29, 28, 27½, 25½, 24, 23, 22½ and 22 cents. It cannot be expected that a man who does a business of perhaps $5,000 per year can carry as many grades as the firm which does $100,000 a year, yet when you do buy from your local dealer you get full value for money or barter without paying in advance.

STOREKEEPER.

Co-operative Household Work.

A FRIEND of mine, who is a busy farmer's wife in Wisconsin, was unable to find anyone to help her with the housework. She had six hired men boarding in the family, which consisted of three children besides herself and her husband. She explained the situation to all the men, and proposed that while she was alone each one could do some part of the housework every day. They were all anxious to coöperate, especially as her plan in no way interfered with their regular work, but merely required a little thoughtfulness and care each day. She allotted certain tasks, so there was no confusion or delay. As each man passed through the kitchen on his way to a meal, he carried something to its place on the table. John took the butter and milk from the refrigerator, Max carried in the vegetables, Henry filled the water pitcher at the well, and Sam saw that the children were presentable and had their bibs adjusted, and helped them at the table. Filling the woodbox, and all the little chores that are quickly done by themselves but entail so many extra steps when one is all alone, were put on schedule the same way. The men knew that the housekeeper never failed to lend a hand when matters crowded outside and she could help in any way. Of course these men were not tramps or green immigrants, but young fellows with a sense of fair play. But my friend believes that she could get the same good will from any man who would be satisfactory on the farm, even though some might be more awkward than her present crew.

EFFIE M. HOWLETT.

The Boon of Parcel Post.

OWING to a long-continued drought in this vicinity, the berries were cut off, but a small quantity of cherries, (none fit for shipping) the damson crop is not promising, neither is the quince and apple crop. I have been greatly disappointed in not being able to supply the applications I have had for farm products by parcel post, but of course I would not sell or offer products of inferior quality. Though not the abundance of rose bloom, as in seasonable years, I have gathered rose leaves for several rose jars, and rose bags, and have the rose jars in preparation. Hope soon to offer the jars for sale, at ten dollars per jar, regular price for the jars, prepared as I prepare them, using attar of rose and other sweet perfumes. I shall not want to ask exorbitant prices for farm products; will give a just weight and try to do unto others as I would have them to do unto me. I believe the parcel post to be one of the greatest boons of the age, helping farmers and farmers' wives, and also city people. Through my 85 years I have not seen the opportunity that it offers, and I hope it will long continue. I have been a widow many years, with no sons at home and it has been hard to make two ends meet, much less overlap, but a fairer prospect opens with the advantage of parcel post. I will let you hear further when I become more established in the business of shipping. I hope to have products later in the season. Chestnuts are coming and I have had application for that commodity.

MRS. N. A. MC MANAWAY.

Virginia.

Flowing Water For the House.

IT is evident that all farmer's wives cannot have a "tireless hired girl" in the shape of a small gas engine. An Illinois farmer struck a happy middle ground in this matter, and it has worked out fine. In his backyard he was lucky enough to strike an artesian well that proved to be soft water. Close to this flowing well and also close to his kitchen he built an auto shelter of an attractive style of architecture, the foundation walls four feet above the ground being of concrete blocks, stained shingles the rest of the way up, with a pretty little hip-roof and dormer window. One half of the shelter house, the side nearest the kitchen he rigged up with a gasoline engine, and then hooked its power to a washing machine and wringer, and he turned the whole over to his wife. There is room enough in the little laundry to do other kinds of work, including ironing. Few gasoline engines are noiseless, the smell of gas sticks to them, and when one is able to locate the power outside but so close to the house it is found to be far more desirable than to have any kind of such contrivance indoors. J. L. GRAFF.

R. N.-Y.—Should we be asked why we put these items under "Business" our answer is that there is no better development of the farm business possible than making the women folks comfortable.

A Small Plant Business.

"HOW many dollars did you receive from the sale of plants?" was the question asked a blacksmith who supplemented his shop income with a hotbed, garden and apiary. As he counted out a hundred plants for a customer, he said:

"I have sold $10 or $12 from this bed. I sold plants very cheap and supplied my own garden, all from a little bed three or four feet wide and about 25 feet long. I just put in my spare time on it and placed horse droppings from the shop in the bottom of the bed. I use no window sash as you see, but just covered it with chicken netting. There is sufficient demand at every cross roads to pay some one to raise a few plants. This is particularly true in communities where general farming is done."

The writer is acquainted with a young man who yearly supplements his income from school teaching by selling plants to farmers in two or three townships. It pays him from a net income of $4 to $6 the day after paying for his plants. It requires no salesmanship, and he uses an old wagon and very ordinary farm horse. Think this plan over for next year, but don't sacrifice your farm work to peddle plants.

W. J.

Boarding and Caring For Invalids.

WHEN new lines of farm business or new farm problems are suggested we try them out with our readers. Here is a new proposition which may appeal to some one, who can make use of it. Our object in printing such things is to suggest possible new lines of business for farm women, and perhaps find some one who may fit the particular case.

My husband and I are living at present on a village homestead caring for the aged and somewhat invalid owner. This is a Summer resort and the house being large I am able to rent the rooms to the Summer people. When they are gone we shall be very quietly situated until another season opens, and I would like to learn of some persons (aged or a little past middle age) who would appreciate a pleasant home in the country. We are but five minutes walk from center, trolley passes door connecting towns along shore. I have known of young persons who had the responsibility of caring for aged persons who would be glad to pay a nominal sum for their care for the sake of being at liberty to enjoy social life in their own set. To persons who would not require special care and were able to eat at the table I could offer a good home for $5 per week. This includes board and room but not laundry. To such, if satisfaction was mutual, the home would not be for Winter season, but for year round. Maybe I am foolish to think that you might reach such through THE R. N.-Y., but I thought no harm in asking. MRS. A. L. M.

Connecticut.

A Business of Meat Canning.

I SHOULD like to know if any of THE R. N.-Y. family ever can fresh pork, and if so, how? Would it be better roasted than boiled? What do they pour over it, stock or lard? Do they use glass cans, and would it keep in warm weather, in a cool cellar? I have tried frying and packing in jars with lard over it, but that in the bottom of the jar will get an old taste before it is gone in warm weather.

H. A. E.

I cannot give satisfactory answers to these questions. C. Canfield, the neighbor I wrote of, puts up hundreds of cans, and it is fine. He puts up in tin cans and cooks, after packing in cans, four hours, but does not like to give specific directions as they would have to answer so many questions. They do custom work at from 65 to 75 cents a dozen cans and many in this community practice killing hogs in the Spring for Summer use, taking hams nad shoulders to Canfields for canning. Sometimes we smoke part of our hams and then get them canned, and they are good, and always ready for any emergency when quick meals are needed. Perhaps it would not be safe to try canning pork without knowing the whole formula and I believe there are books on canning giving directions. Canfield puts up thousands of cans of beef during a year and also poultry, rabbits, etc. E. A. B.

BOILING CORN.—I must disagree with your correspondent, J. M. B., about how to boil sweet corn. As I have 10 children, who all love it, and use from 20 to 30 ears a day, we have tried every method, and find the best result from dropping the corn into boiling water, over a hot fire, and when the water comes to a boil again, the corn is ready to serve. Try it. A. C. W.

"The Favorite Hen."

[The women who have entered hens in the egg-laying contest have sent us histories of their flocks and in many cases, have told us how they came into the business. Here is a sample history.]

THE history of my flock of chickens began seven years ago. At that time to help along with the family expenses I sewed pants at home for a woman who distributed this work for a Philadelphia firm. The work was so poorly paid that it was almost a starvation job. Being tired of working at a sewing machine for almost nothing, my thoughts turned to chickens, and I reasoned out that if I could earn as much with chickens as I did with sewing I would be satisfied, for then I would be out in the fresh air and not be tied down to a sewing machine. We had plenty of wild land, so with some old boards we fixed up a small house and began with 14 hens that I had raised, to keep account, to see if chickens really paid. I had heard so many discouraging reports from people around that I felt rather timid until I found out for myself. At the end of the year, after paying for all the feed, I had $20 profit. This encouraged me, and I kept increasing my flock slowly every year. Last Fall I had 450 hens. My general profit during seven years has been about $1 per hen. The breed is Black Minoreas, and it began this way: My original birds were obtained from eggs that I had bought from an old bachelor who had a flock of Barred Rocks which he said were mixed with Black Spanish. Strangely enough my birds were black-feathered and ever after that I bred these birds with purebred Black Minorea males. Lately I have become interested in the Leghorns and bought 18 hens, S. C. White Leghorns, from a neighbor who moved away, and sent last Fall through Mr. Cosgrove for a cockerel from Tom Barron. From this mating I now have some fine pullets which I am going to compare this year with some of my Black Minorca pullets. Our general farming is with berries and in 20 years we have not yet been able to lift the mortgage off our place. My husband and I now feel that we can do better with chickens, but we can only go slow on account of lack of capital. Of course my husband has to help with the work around the chickens now; after I reached the hundred mark the work was getting too much for me.

MRS. JOSEPH DI FABRIZIO.

New Jersey.

My Mother-in-law's Ways.

MY mother-in-law was years ahead of her time because, more than any housekeeper I ever worked with, she always studied out the best way to do things. The idea of most value to me, was her way of washing dishes. She never wiped them. After washing them she passed them through a hot rinsing water, and stacked them loosely in a large pan with a cloth laid folded in the bottom. They soon dry and one can put them away, or leave them in the pan until the next meal. This saves wiping towels, and the dishes will shine. Then she used to do up collars and cuffs so nicely. She would put a teaspoon of starch in a pint bowl, a half teaspoonful of powdered borax, a drop of liquid bluing added to starch and fill up the bowl with cold water. The collars and cuffs were dipped in this and then rubbed between the hands until the starch was well rubbed in. Then she took a clean sheet and moderately hot irons, and ironed the collars and cuffs first while they were still quite damp. They looked, when done, like the dull finished laundry work of today and beautifully white. Her recipe for apple pudding I've never seen given. She took one quart of flour, tablespoon shortening, one teaspoonful baking powder, salt, and enough milk to make a soft dough. Into this she stirred slices of quick cooking apples, two large ones at least. Put into well greased pan, and bake in quick oven one-half hour. To be eaten with cream and sugar or thin syrup. The apple flavors the whole pudding and tasted so "different." R. M. B.

Two Household Inventions.

THE Colorado Agricultural College News announces two inventions which, if proved practical, should help:

CLEANING CLOTHES BY VACUUM.—The vacuum clothes cleaner, a piece of apparatus consisting of a circular brush with an opening in the center, is placed in front of an electrically operated fan for suction, and a dust catcher. The whole is held in the hand and the brush passed over the clothes. As the dust is loosened by the brush the fan draws it in and deposits it in the catcher.

AN ELECTRICALLY HEATED GLOVE.—A valuable addition for the auto driver's Winter dress is an electrically heated glove. This is made flexible, and contains a number of resistance wires in the wrist and back of the glove so that the heat is applied to the back and fingers of the hand. The current furnishing the heat is turned on when the gloves grasp the metallic parts of the steering apparatus, which is in electrical connection with the battery furnishing current for the lights.

A Dead Owl Scarecrow.

APROPOS of that picture of a cherry tree covered with mosquito netting, I found a scarecrow this year that worked well. I have a nice batch of White Leghorn pullets hatched in March and April, and although they have good roosting quarters provided, and notwithstanding the fact that they are high-bred birds, having the blood of the Barron, Niagara, White and Rice, and other good strains, still they persist in heeding the call of the wild and roosting in the trees, there being several cheerry, pear and apple trees near their quarters. As a result of this habit an owl became a visitor at their roosting place. I set a trap on a high post nearby, and in a few nights caught Mr. Owl, a big one with a wing spread of four feet and four inches. About this time the robins and woodpeckers became very numerous in my cherry trees, so I hung the owl (dead, of course), in the highest trees, so that he would swing back and forth in the breeze. The birds disappeared as if by magic. I cannot say that this plan would always work. If it would it might pay to get a stuffed owl and be ready for them, for one might not always be able to catch an owl at cherry time. This is not a tested remedy, but I offer it for what it is worth. CHESTER L. MILLS.

New York.

:: "Short Stories" ::

Rag Mittens.

"MRS WHEELER, what is it you are knitting those mittens out of?" said Mrs. Bloye.

"I am knitting them out of carpet rags. I take black cotton cloth and plain white or red cotton cloth and tear it in strips about one-fourth of an inch wide and sew them together as you would carpet rags, then knit just as if you were knitting yarn mittens."

"They look like striped yarn mittens. I should not have known the difference at a little distance."

"That is what every one says. I made Mr. Wheeler a pair of them the first Winter we were married. I did not have any yarn, and we had no money to buy any with, or mittens either. So I took cotton rags and made him a pair like these. He wore them for driving all Winter. He said they were the warmest mittens he ever wore. They lasted him two years and they were all the mittens he had then."

"I should think they would be fine for boys, they wear out yarn mittens so fast."

"They are. I have knit a number of pairs for the neighbor's boys, and knit some for men and sold them for 75 cents a pair."

"I would not be surprised if my son should want you to knit him a pair when he sees them," said Mrs. Bloye.

New York. MRS. H. A. B.

A Backyard Fruit Garden.

ONE of our problems has been the subduing of weeds in the backyard. By actual count, there were 29 species in that 30x40 foot space, all doing their prettiest to get head and shoulders above their neighbors. As the starting of grass seemed a hopeless proposition, some effort was made to establish strong-growing, native plants, such as the wild sunflower and red-flowered raspberry, but they were soon crowded out by the weeds. At last, a small quince tree was planted in the center of the plot. No special care was given it, except to pile the weeds as they were cut around it. Sometimes, in dry weather, the water from the weekly wash was poured about its roots. It flourished mightily but, in its second year, met with a mishap which twisted its trunk sideways so that it almost reclines upon the ground. This would have caused some trees to give up the ghost, but not the sturdy quince. In its third year, it gave us the first fruit, several great, golden globes as fine as one could wish for. This set us thinking, why not more fruit? By degrees, we have added three more quince trees, an Early Richmond cherry, and a peach tree. As there are also two old rose bushes and a large lilac, our space is full, but we intend to squeeze in a Reine Claude plum next the peach tree to take the place of that short-lived individual when it dies. The trees are all too young to bear full crops, but last Fall, after making what jelly we wanted, we canned 30 quarts of quinces, using half sweet apples. There was still a basket of fine fruit for which the grocer paid us 75 cents. This pleased us for it looks as though we shall soon be receiving interest on our investment. As for the weeds, they are doomed, for, now that we are interested in our experiment, their eradication is no longer an irksome task.

M. E. C.

"THE FAVORITE HEN"

LAST month we stated the situation regarding the hen contest. There were nearly 90 entries while we are limited to 33 hens—that is, three pens of 10 hens each and three substitutes.. We asked the women who entered these hens to suggest a way of settling the matter. They have been very nice about it. Some promptly withdrew their entries. They all agree that the fairest way will be for The Rural New-Yorker to select the hens, and they all state that they will be fully satisfied with our decision.

Should Have Uniform Pens

These hens are to be entered at the next egg-laying contest at Storrs, Conn. There will be 10 hens to the pen, and the managers desire, if possible, to have a uniform outfit. It will be much better, for example, to have a straight pen of Leghorn or of "Rocks" than to have pens made up of different breeds. We agree with that, though it will be necessary to have one mixed pen of these "favorite hens"

White Leghorn and Rhode Island Red

We find that about one-third of these farm women entered R. I. Red hens and nearly another third White Leghorns. The balance includes hens of 8 or 10 other breeds. There are more Barred Rocks than of any other of these breeds, but not enough of any one to make a full pen of 10. We have therefore decided to make up one pen of Leghorns, one of R. I. Reds and, if the managers of the contest agree, one of four Rocks, three Wyandottes, two Orpingtons and one Black Minorca. This will give all breeds a showing in proportion to their entries. In selecting the Leghorns and Reds we have obtained histories of the flocks and tried, whenever possible, to give the choice to typical farm women who are not professional breeders or advertisers, but who own what may be called a good farm flock. As soon as we have arranged with the contest managers names and addresses will be printed.

SWEETENING A CISTERN.—J. D. M., Albany, can make his cistern sweet in a few minutes by dropping in a stone tied to a rubber tub , which will go to the bottom, and pumping air through it with any kind of an air pump. This will also work in any well, where a dead mole or robin has made the water foul. It is so simple that people overlook it. A. C. W.

CONVENIENT MILK-ROOM.—I have seen a very good milk-room of brick, almost ssuare with cement floor. If I build one it will be of conerete (cement up to the windows, the remainder of lumber). There is an engine and a long shaft from another room, in fact it reaches across four or five rooms, and actuates separator and churn. It also passes through the wood house, cuts the wood; turns the grindstone and silage cutter. A rope that winds on a drum does a lot of lifting at the barn. Those four or five rooms are the long building between the house and barn, with shed roof on one side and cement walk. That milk-room has a large box, a refrigerator on wheels. The churn and shelves too have castors.

D. C. K.

BLACKENING TOP F STOVE.—Tell Mrs. W. H. G. that as her stove has been washed so long, but little polish will stick on. I have had some experience with the same trouble, and find that if the stove is greased with some kind of grease mixed with half its size of lamp-black it stays black. This is the way I did it: One cup of melted grease, one-half cup lamp-black, stir thoroughly and apply with a brush. This will not shine very much, but will make it black. Build a good fire in stove after putting it on. One can also buy enamel at any drug store but this is costly. Here is a hint: Grease new tins or any iron you use around stove and bake them in a hot or warm oven for three hours or more according to heat in stove; they will not rust then.

MRS. MARY SEALY.

TO KEEP COMFORTER CLEAN.—I did housework for a lady once, who was very neat and had some good ways of saving herself extra work. She always put what she called a collar on her bed comforter. She took a piece of cloth like the comforter, the full width of the calico and as long as the comforter was wide, and sewed it on the right side of the comforter at the top, then turned it over and sewed it down by hand on the wrong side. When it became soiled (for the top of a comforter always gets soiled first) she ripped it off and washed it, then sewed it back on again. By doing so she saved herself work in washing a heavy comforter, and it kept it from wearing out so soon. MRS. H. A. B.

Cattaraugus Co., N. Y.

DANDELION COFFEE.—A good healthful substitute for coffee in the Spring, or even at other times, is dandelion coffee. It is made as follows: Dig the roots (or they can be bought ready dried at a drug store) wash them clean, (I use a vegetable brush to clean them) and cut up in thin slices about an eighth of an inch thick. Spread them out in a large tin and put in the oven to dry, let them brown well but do not burn them. When well dried put away in a sack to use when needed. Allow one tablespoonful of the dried roots to a person, putting them in a coffee pot with cold water on them, let it come to a boil and boil a little while. Drink with cream and sugar. Our family and others that I have known of drinking it think it delicious.

New York. MRS. H. A. B.

CLEANING WASTE PIPE.—Henry Doerner of the Colorado Agriculture College gives the following directions: "One of the most trying annoyances of housekeeping is the obstructions to the free, quick outlet of waste water of the washstand, bathtub, or kitchen sink. This is caused by the gradual accumulation of small bits of refuse material which check and finally entirely stop the outflow of waste water. A simple, inexpensive method of cleaning the pipe is as follows: Just before retiring at night, pour into the pipe enough liquid potash (not soda) lye of about 36 per cent. strength to fill the "trap," as it is called, or bent portion of the pipe just below the outlet. The amount necessary will be from one to two pints. Be sure that no water runs into it until the next morning. During the night the lye will convert all of the fat or grease into soft soap and the first current of water in the morning will remove it entirely and leave the pipe as clean as new."

What Dishwashing Is.

DISHWASHING is a process which normally takes place in the household three times a day and yet how little the housewife realizes that the whole scheme of procedure is based on scientific principles. The aim of the housewife is to remove dirt. Now this dirt is of two kinds, biological and chemical. The biological dirt is invisible, and is in the form of minute bacteria, or as they are popularly called "germs." The danger from this kind of dirt can only be done away with through "boiling" (or scientifically speaking "sterilization"). In the average family, except in cases of sickness, this form of cleaning is sufficiently taken care of by rinsing the dishes with boiling hot water. But in institutions, hotels, boarding houses and the like, where large numbers of people are banded together, longer and more thorough sterilization is absolutely necessary. In large dishwashing machines it is generally done by running live steam through the water in which the dishes are being washed.

The chemical cleaning process is the one used in the home. Chemical dirt can be seen. It is the residue from our food and needs no further explanation. The first thing the housewife does is to remove all such material possible by scraping. This is easy, and should be thoroughly done, as it greatly facilitates the rest of the process.

Next stage is the hot soapy-water bath. Soap is used primarily to "cut" the grease. As almost all animal food contains grease in varying proportions, and by the hardening of this grease adheres to the dishes, this is a very essential part of the dishwashing process. Soap is made from grease and an alkali which are boiled together until they chemically combine, with soap as the product. This product when put into water chemically reacts with the water and liberates some of the alkali. The liberated alkali then combines with the grease on the dishes and forms a "soapy-like" product which is soluble in water and "dissolves" off the dishes, leaving them clean when removed from the soapy bath. If too many greasy dishes are washed in the same soap bath there is not enough liberated alkali to react with all of the grease, and consequently the grease is not all removed from the dishes and the water becomes greasy.

The stickiness of most vegetable foods is due to cooked starch. This is soluble in water and could be soaked off without the use of soap. Such foods dry ont very quickly if the dishes are allowed to stand without soaking and are then very difficult to remove. Hot water is best for three reasons; first because the heat partially melts the grease on the dishes, second because the chemical action of soap is greater in hot than in cold water, and third because the starch is more soluble in hot water.

Soap is not a pleasant flavor when mixed with food, therefore it is necessary that the dishes be carefully rinsed to remove all traces of it. The ideal way of doing this is to arrange them in a wire dish drainer. (These can be bought and are very inexpensive.) Stand the drainer full of dishes on a drain-board, in the sink, or if no sink is available, in a large pan, and pour boiling hot water over them. Then allow the dishes to air dry in the drainer. If thoroughly rinsed, dishes thus dried are fully as clean and "polished" as those laboriously dried by hand and the whole process is very much shortened. Besides the necessity of washing out dish towels is eliminated.

If the housekeeper does her own work and prefers to spend her whole evening with her husband, rather than to take time after the evening meal for dishwashing, it is perfectly easy to carefully scrape the dishes, pile them in a large pan and cover with water to which has been added a little washing soda. In the morning it takes but a few minutes longer to wash them with those from breakfast, and thus accomplish the day's dishwashing in two rather than in three lots.

Housewives' Handy Table.

The following list of weight and measures equivalents will be found very handy. It is especially valuable when ordering supplies for the family or for special occasions. Mount it on card board and fasten it up in some convenient spot in either kitchen or pantry. You will be surprised how many times you will refer to it.

Bacon, 30-35 thin slices in one pound.

Baking powder, 2½ cups in one pound.

Beans—(Navy, kidney or lima) 2½ cups in one pound.

Butter, 2 cups in one pound.

Cocoa, 3½ cups in one pound.

Coffee, (ground) 5 cups in one pound.

Cornmeal, 2⅔ cups in one pound.

Dates, 45-48 small or 30 large in one pound.

Eggs, 8-9 medium size in one pound.

Flour, 4 cups in one pound.

Lemon, juice of one generally measures three tablespoons.

Meat, (finely chopped) 2 cups in one pound.

Oats, (rolled) 5 cups in one pound.

Onions, 8 medium size in one pound.

Orange, juice of one generally measures ½ to ¾ cup.

Peanuts, 1 pound will give one cup of shelled nuts.

Prunes, 40 large or 60 small in one pound.

Potatoes, 4 medium size in one pound.

Rice, 2 cups in one pound; 1 cup of raw rice will make 4 cups cooked.

Saltines, from 100 to 120 in a pound, depending upon shape.

Soda, 2 cups in a pound.

Spices, (ground) one cup weighs 4 ounces.

Sugar, granulated, 2 cups in one pound; powdered 2 2-3; brown 2 2-3; loaf, 75 pieces; domino, 56.

English walnuts, 70; one pound will yield one cup of meat.

Any housewife can see how such a list could be added to indefinitely.

The Science of Common Things

By Bertha Betts

Sugar in Canned Fruit.

The fruit, pulp and juice, is generally "put up" in two ways by the average housekeeper. It is either canned with a small amount of sugar, just sufficient to give a pleasant sweetness, or it is preserved with a large amount of sugar. In the latter method enough sugar is used to preserve the fruit without as thorough sterilization of fruits and receptacle as must be done when canning with a small amount of sugar. Sugar is a preservative when used in large quantities. In preserving, the fruit is boiled for considerable time, then sugar added and boiling continued until the proper concentration of thick fruity syrup has been reached. During this boiling the fruit loses its shape and the mixture becomes jam-like. Fruit loses its shape and becomes dark in color when cooked in a syrup.

In canning, if the aim of the housewife is to preserve the fruit in as near its original form as possible, the sugar must not be added until the fruit has been, at least partially cooked in water or by steaming. Then the water in which it was cooked may be boiled down, sugar added and the resulting syrup poured over the fruit which has been previously placed in sterilized jars. Or the raw fruit may be packed in the jars, sugar and water added and the whole sterilized in a steam bath, oven or fireless cooker. This method does not produce as rich a product as the first, and neither of these methods produces as rich a product as can be obtained when a sugar and water syrup is made at first and the fruit cooked in the syrup until tender. Care must be taken that the syrup is not too "strong" or concentrated. If too concentrated the fruit juices will, by a process of osmosis, pass through the containing cell walls of the pulp into the syrup, (popularly speaking "be drawn out") and leave the fruit shriveled and toughened.

Acid fruits so canned will need a larger amount of sugar than will slightly acid fruits to produce the same degree of sweetness in the finished product. The reason for this is that when granulated sugar is boiled with an acid a chemical change takes place and the sugar is hydrolized or changed into a "simpler" sugar which is very much less sweet to the taste.

Sugar added after the fruit has been cooked insures a natural shaped fruit of nearly natural color surrounded by a clear fluid, and is liable to taste insipid, unless the syrup has been sufficiently concentrated by boiling. On the other hand if the sugar is at once made into a syrup and the fruit cooked therein the fruit is liable to be darker in color and less perfect in shape, but more rich as to flavor. The keeping quality is the same in all methods. In either case the jars and all utensils used must be thoroughly sterilized.

Why Are "New" Potatoes Best?

DEALERS make a great point in advertising early potatoes, that they are *new* potatoes. The question is, why do they make a point of this? Have early potatoes a better flavor? Do they contain something of food value not in old potatoes? In short is there anything about new potatoes that should give them an increased value or make them more in demand? F. I. C.

New potatoes are in demand because at this time of year the old potatoes have deteriorated as to cooking value as well as in flavor. The early potatoes, although not as good as those which will come later in the season, are still superior to partly sprouted and wilted old potatoes. There is a chemical reason. Nature uses the potato tuber as a storehouse for the food elaborated by the potato plant. This stored food is designed as nourishment for the new potato plant which will be forthcoming as its successor. The food used by the plant is sugar, but it is stored in the form of starch. The potato when harvested is rich in starch, it lies dormant all Winter, its starch content remaining nearly constant, but when Spring comes a chemical change takes place. The potato begins to sprout, and its starch content begins to be converted into sugar as food for the growing sprouts. Gradually the starch disappears as sugar into the new growth, and the potato tuber becomes shriveled. This chemical change begins before the sprouts grow, and therefore in the Spring a potato which appears perfect in every outward respect will still have a much smaller starch content than it had in the preceding Fall. A mealy potato is one of high starch content. The standard of good cooking potatoes, in this country, is that of mealiness. A soggy potato is of little value here except for certain varieties of fried potatoes. In France and Germany potatoes are more extensively served fried or in salads, therefore the soggy potato is preferred. Personally I prefer an old potato of good variety, one in which the starch content was originally high, and which has been carefully kept so as to prevent sprouting, to a new one of poor variety and low original starch content. B. B.

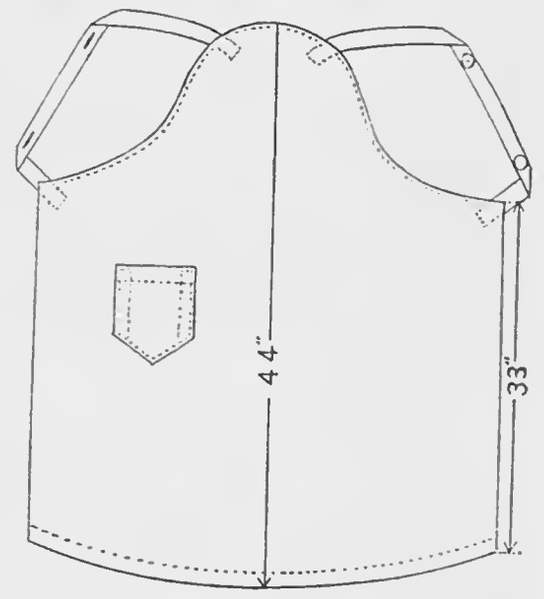
When Children Crave Meat.

WE often see the statement that meat is bad for children, but lack of meat is the cause of weakness and ill-health when the meat elements are not supplied by an abundance of milk, eggs and fresh fish. Parents often refuse meat to their children who seem to crave it, but being unable to afford a pint of milk and an egg every day for each child, the children are given too great a proportion of starchy food and sweets. They often lack the vitality to digest the cereals, are listless and tired, and liable to contract many diseases whose cause is poor digestion and under-nourishment. The craving for meat is a right one, and can be satisfied if the meat is served with some simple non-nourishing vegetable of a salad nature. Tell Johnny he may have a piece of fresh meat if he will eat a dozen lettuce leaves or a few stalks of celery or a large helping of cooked spinach or other greens, or the same quantity of raw cucumber, each served without fancy dressing.

My two little boys, aged five and three, will eat lettuce by the plateful without anything on it, and I find I can give them meat, even fresh lean pork, with good results if combined in this way. I never use vinegar for them, preferring that they should learn the natural flavor of each vegetable. Tomatoes and fresh fruits are also valuable, but many mothers do not appreciate the value or understand the office of the salad vegetable in carrying away waste and purifying the system. If a mother will furnish these combinations she need not fear the bad effect of a generous meat allowance, and a delicate child will soon show the effects of new blood in the bright eyes, rosy cheeks and strong nerves which only meat can supply. MRS. L. V. COOK.

My Kitchen Apron.

WHEN I set about designing a kitchen apron I had three things in mind. I wanted an apron that would protect the front of my waist as well as my skirt, that would be easy to make, and that could be laundered in the shortest possible time. The pattern here described I have used for three years, and like it, because it fulfills all these conditions.



KITCHEN APRON.

The apron is made as wide as the percale, thus giving a selvage at each edge and saving hemming. The length I need is 44 inches from the top of the bib to the bottom of the hem. The length of the selvage edges is 33 inches, the width of the bib at the top is 12 inches. The simplicity of laundering this apron is a great recommendation, for it has no gathers or seams to dry.

It took some time to perfect the straps. I started with tie strings at the corners and a neck strap attached to the bib. This, however, I soon discarded because

ADJUSTMENT OF STRAPS IN BACK.

it pressed uncomfortably on the back of my neck. I now cut two straight strips of percale, 27 inches long and 1½ inches wide, which I fold and stitch together, making two double straps. One end of each strap I stitch to the upper corners of the bib. Eleven inches from these corners I make a turn, and 12 inches farther down I make another turn. This leaves a short end of a strap which can be stitched to the corners of the apron at proper adjustment to fit the hips of the person to wear the apron. One strap has two buttons on the second section, one near each turn, and the other has buttonholes to correspond. When worn, the second sections of the two straps lie together straight down the back.

ANNIE E. HARRIS.

A Chapter on Dress Collars

How to Obtain A Variety

By Esther A. Cosse

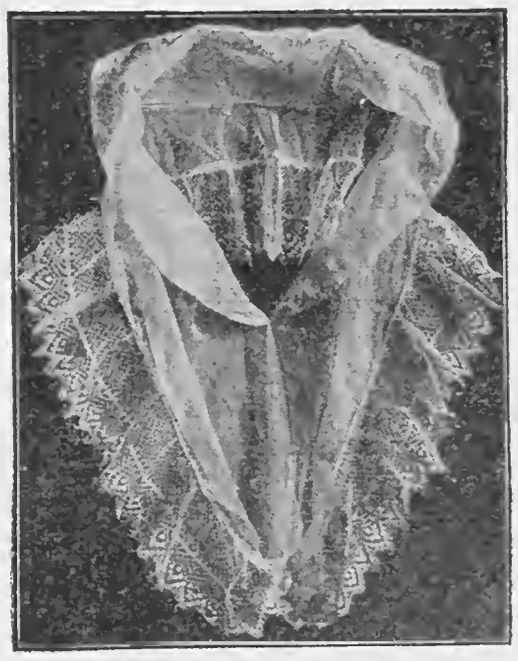
ALTERING A DRESS.—Have you a dress that you have purchased and feel that the waist looks a little different from what others do this season? Well, if you have one such and desire to have it look a little more modern, the remedy is very simple. It is difficult to keep our clothes, as we term, "up-to-date" since new things are introduced every week, or, in fact, every day, and pray who can change the costume every week, much less every day? Even though we have dresses or suits for every day in the week and every occasion it is impossible to keep up with the changes. But there has been one change recently, which, it seems to me has greatly improved women's waists. That is the use of fancy collars. By this means, one can have a perfectly plain shirt-waist suit, either with the skirt and waist attached, or separate, baste on one of these collars, and have a dress suitable to wear for any occasion. Of course much depends upon the material of the garment, some would have a dainty organdie, which when viewed now looks a little plain. Procure a little net and lace, make one of the collars, and your costume is suitable for even the most dressy occasion, or for one that is worn to church, etc.

USING UP ODDMENTS.—Many times, if we would but look about the house we will discover in a box stored away in the attic or store-room some pieces of silk, either in a color or white, and some pieces of lace, varying in width and texture. Again we find that some aunt or relative has in the past made us a pretty lace collar of Irish crochet or some other design. What is the reason these things can't be used in these days that collars of every description and color are used? Then we may run across a piece of organdie, fine lawn, silk, chiffon or some such cloth, and these can very easily be made into a vest and collar. Any of these varieties will add much to the appearance of the dress. Sometimes we have a plain shirtwaist and we want to make it a little fancy for a certain occasion. If one of these collars is added to it, one would find the waist vastly improved. Women must not imagine they can't make these pretty collars. They may have seen one on some one else and wished they had one like it. Did you ever try to cut a pattern for one after you have reached home? Well, if you had done, you would have seen that it is an easy thing to cut. Of course everyone knows how large a collar must be for the neck, yet in these days when tight necks are not used, it is difficult for a woman to remember what size she would need, as many have grown larger since they used neck bands last.

BECOMING STYLES.—A large woman must by all means avoid a high collar, or one that is large, even though it may roll, as it makes her appear round-shouldered. There are many styles with soft lace about the neck, that is wired, but not to stand too high, that are suitable without the use of the rolling collar. I know all women like the rolling collar, especially in the Summer, but the stout woman does not look well with any fullness about the neck. If one would notice that all artists take away all fullness from the shoulders of a woman before they start to make pictures. If left there, the only thing one would be able to see in the picture would be the full collar. As I said before there are many styles that are becoming and they need not worry over things they can't have, but take advantage of the good things they can have that will be suitable. These collars are very inexpensive even though we have to secure the material for the whole thing. The one shown in the first illustration is made of net and requires one half yard of yard-wide net and two yards of lace three inches wide.

MAKING THE COLLAR.—To make it first cut a sailor collar 11 inches wide across the back and four inches deep, with a piece 11½ inches from the back to the front point. Next cut a back yoke to which is attached a strip of net 15 inches long and 7½ inches wide. Sew two collars together, then attach to the yoke and after sewing on the front pieces, gather the lower points of front together and sew the lace all around the yoke and front, as shown in illustration. Secure one yard of wire for collars and sew in four pieces, one at each side and the other two one and a half inches from the center back, on both sides. Trim with dainty little buttons down the front and catch with very small hooks and eyes or small clasps. Baste this collar to the back of the waist, at base of yoke and pin at the bottom of the front. Any style of girdle is used with it. It will trim any dress and can easily be removed and laundered, neither is the net perishable and can be worn any number of times without fear of being ruined.

ANOTHER STYLE. — Another collar, which is made very much different, but equally as pretty and dressy, is made from a piece of white silk and shadow



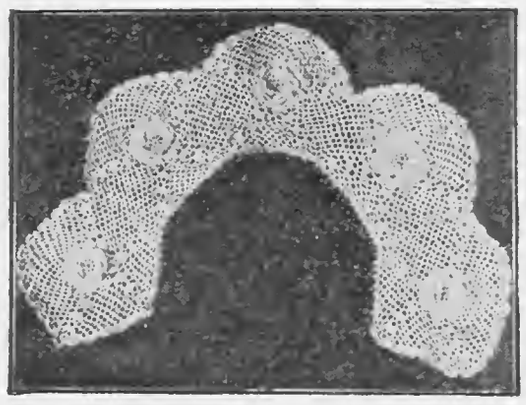
COLLAR MADE OF LACE AND NET.

lace. This is made quickly, even in less time than the first one, as there are very few rough edges to cover. Find among your patterns a waist that has a sailor collar and a yoke in order to get the proper shape about the neck, then cut the collar as small as you desire. The one shown in the second illustration is but three inches wide, and is especially becoming to the stout woman. The points measure 4¾ inches, and from front point to back 6¼ inches. The neck measures 15 inches around. The yoke is 2½ inches wide and the vest the same width and 10 inches long. Pearl buttons are attached over small hooks and eyes. It requires one yard of shadow lace 11 inches wide. Half is sewed to each front of the yoke. The collar is made double and attached to neck. Small tucks are sewed in each corner and up the center back and the wire is run through. The

COLLAR OF SILK AND SHADOW LACE.

wire is very soft, and resembles covered tie wire, such as is used to tie wire frames for hats. This is attached the same as the first one. The ends are gathered and fastened to the waist.

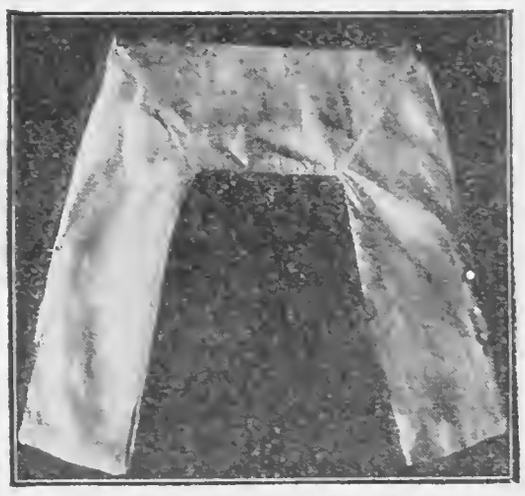
AN ORGANDIE COLLAR.—One made of organdie and suitaable for a shirtwaist suit is simple in design; made double and sewed to a waist that needs a small vest. The collar is rolling and needs no wire, but when it is laundered it is advisable to run it through a thin starch. Like all the others it is cut from a sailor-collar pattern, but when it comes to the front, the strips are made straight 18 inches long. The collar measures 13½ inches across the back, and the points are 6½ inches deep. The straight width of the collar is five inches. These pieces are sewed together and in the illustration are hemstitched up the points, which was done by using a very coarse needle on the machine and running it through on card board. It is sewed to the back of the neck for four inches across the center back, then when the collar is put on, the end is turned over and drawn to the front. The front edge is trimmed with buttons, and the other side as the under part of the



ROUND COLLAR OF IRISH CROCHET.

clasps, as can be seen in illustration below. When this is put on, the lower edges must be pinned to the underwaist in order to keep the waist from slipping down the back and the collar in place. It requires half a yard of organdie or fine lawn and four buttons.

IRISH CROCHET COLLAR.—Another collar which is crocheted, in fact called Irish crochet, is very simple in design, but makes a big improvement in a dress with which it is worn. It is wired much the same as the other collars, but falls soft about the neck. The same wiring can be done with any lace collar which many people have had given them. The rose is made first. It requires a little more than one ball of D. M. C. No. 50. It is made: Chain six and make a circle by slipstitching it together. Chain 15, one double crochet, chain three, one double and continue to end of row when you will have eight spaces. Join by slipstitching last double to chain. 2d Row—One single crochet, six doubles, one single, into each of the eight spaces, for first row of petals. 3d Row—Chain five and turn work to wrong side and catch into first single of last petal on the back. Continue until you have eight spaces. Turn



AN ORGANDIE COLLAR.

to other side. 4th Row—One single, nine doubles, one single in each space around rose. Turn. 5th Row—Chain seven and make like 3d row. Turn back. 6th Row—One single, 12 doubles one single in each space. Turn. 7th Row—Chain nine and make like 5th row. Turn. 8th Row—One single, 15 doubles, one single in each space. Rose is now completed. 9th Row—Chain five and go in the fifth stitch with a single crochet; chain five and go into 10th stitch; chain five and go into 15th stitch and so on. 10th Row—Same as the ninth only going into third stitch of each space. 11th Row—Slipstitch forward to third stitch of chain, chain five and make 10 doubles in next space. Chain five and make three spaces by catching into third chain of previous row in each space with a single crochet; chain five and make 10 doubles in next space; chain five and make two spaces; chain five and make 10 doubles in next space. Make three spaces and chain five and go into next space with 10 doubles. You now have 12 spaces. Chain five and slipstitch. 12th Row—Chain five and go into fifth stitch with single; chain five and go in last stitch; chain five and go in third stitch of next space with single, and so on to end of row. Slip stitch to join. Shells must be made directly over the first. 13th Row—Chain five and go in the third stitch of every space. 14th Row—Make the same as 11th row, putting the double crochets directly over those of the 11th row, as you are making a medallion and widening on each row. 15th Row—Made same as 12th row. 16th Row—Same as 13th row. 17th Row—Same as 14th row. 18th Row—Same as 15th row. 19th Row—Same as 16th row. 20th Row—Same as 16th row. Break thread and make five medallions for the collar.

JOINING AND EDGE.—The narrow part is the neck. Take two medallions and join from one to the other by chaining three and catching into third stitch of each space with a single crochet. Fasten thread and make three single crochets in each space around the neck. When you reach end go on down front and make one double in first space; chain five, make a picot by going into third stitch of chain with a slipstitch; chain three and go into same space with double. Make four picots in each space, one single crochet in next space, then one double, etc., all the way around until neck is reached. Then chain five, make a picot, chain two and go in every third stitch.

Handling the Bird.

GENERAL DIRECTIONS.—I have a bird, a beautiful singer, and have had other birds—always with great success in caring for them. Always keep the cage clean. At least every other day scald with boiling water tin bottom of cage, perches and drinking cup. Take a feather, clean inside of drinking cup; this is really very necessary, as water sometimes settles, and a scum will get in corners unless cleaned with a feather. Give fresh water every day, and keep seed cup full. Don't buy cheap mixtures of seed; always buy the best mixtures, so that there is no hemp. Once a week give a small dish of raw grated carrot, a sprig of water cress, or a little lettuce. They are all fond of these, and will eat quite a lot. Be sure these green things are perfectly clean, and don't give a big quantity. Keep a cuttle bone in reach. Don't feed sugar, pastry or sweets of any kind, as this makes them fat, and a fat bird sings very little. Let him bathe often.

SPECIAL NEEDS.—I do not think it good to hang them out in Summer. They are sure to get cold some time, and if a bird has once a bad cold it never sings much again. A little bread and ground red pepper is good for slight cold. Be careful of cats. Canaries will die of fright without being caught. Keep the top of cage clean, where the knob that holds the ring is, as this is a great place for lice. Take a cloth wet with kerosene oil, put a little bird manna in seed. Some say to put this in the cage, for it comes fixed to hang, but I find they will eat it all up at once this way.

I always keep my bird in Winter in a sunny south window, with some sunshine. I put my bird in another cage and clean the brass one with some good cleaner. Do this once in a while; it keeps the cage so bright. For lice, put a little sulphur on top of head, under wings and tail. Use only a pinch. I find this will drive them away. Perhaps this will help some one with a canary bird who is inexperienced. J.

"FARMHOUSE Amusements For Boys and Girls" is the title of No. 9, Rural Life Series, issued by the New York College of Agriculture at Ithaca. The object of this pamphlet, as stated, is to help girls and boys to "lay in a stock of ideas for Winter enjoyment." The Winter evenings are often dull unless amusement as well as work can be planned. It will pay to read and study this bulletin.

Mother's Sewing Room

Farm Dressmaker's Work Shop

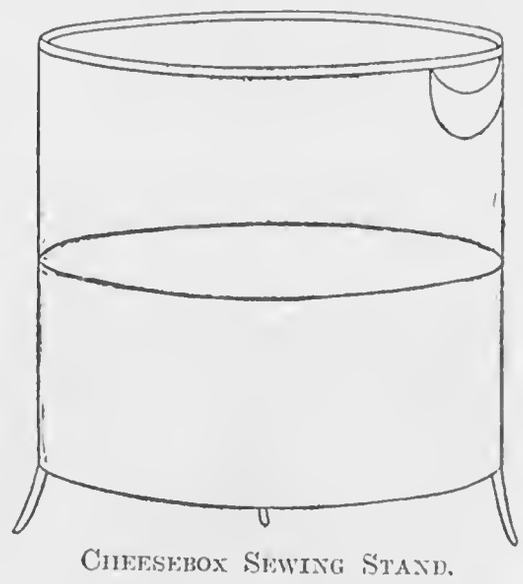
"By a Farmer's Wife"

PART I.

HOW IT STARTED.—For a number of years my sewing machine migrated from sitting-room to dining-room, and on to sleeping room, thence back to starting place, to begin the trip over again. This was a source of annoyance, as it, together with the work which necessarily accompanied it, was always in the way. At last relief came through taking a small bedroom adjoining kitchen for a regular sewing room. My husband put a shelf three feet wide across one side of the room, just high enough for a cutting table and another two feet wide across the other side and higher up. This latter shelf was used for storage purposes. This room was a great comfort and convenience, only it was too small. As the years passed and the older sons began to establish homes of their own, I found we had vacant rooms upstairs and realizing that the men needed the room I was using I had the sewing machine taken to one of the rooms above, where it has remained ever since. This is a good-sized, well-lighted room with large clothes room connecting with it. Here I can store everything that pertains to sewing, as well as many other articles. Nothing is ever disturbed by the rest of the family. My work can be dropped at any time, left indefinitely, and will be just as it was laid down when I return. It creates a feeling of comfort to know that it isn't in anyone's way. The only drawback is that the room is in the second floor, for with the passing years I find it a little more difficult to climb the stairs, and I cannot help an occasional sigh of regret for the little room down stairs off the kitchen.

CONVENIENCES AND ARRANGEMENT.—As we did not wish to build broad shelves in this room, my husband bought a cutting table measuring 48x28 inches. This is large enough to cut a skirt nicely, but is not quite so convenient as the wide shelf which I had below. This cutting table stands next to the machine in order that the materials upon it can be easily reached when doing machine work. Upon it are kept a 60-inch tape measure, a pair of shears, a spool of basting thread and some milliner's needles, also a piece of chalk and plenty of pins. The needles mentioned are especially good for basting. Back of the machine hangs a little cupboard made of a shallow box, where are kept a sort of reserve supply of thread, buttons, buttonmoulds, hooks and eyes, silk and twist, etc. Tacked to the right end of the machine is a scrap bag into which are pushed pieces of thread, empty spools, etc. Another scrap bag is tacked to the wall near the cutting table, and a peach basket does duty for waste papers. Another table holds a large box of patterns also fashion magazines of which I take two; this table is also a good place upon which to lay extra work. Still another table, which is an especially convenient article for this particular room, measures 42x21 inches. My husband sawed off the bottoms of the legs so it stands 24 inches high. As it was a homemade affair in the first place, the framework underneath was quite bulky, by cutting away a part of this on one side, it enables the sewer to use this table as a lapboard when needed. A covering of oilcloth securely tacked renders it very convenient from which to pick up the different articles in use. On it are kept a couple of box covers, which contain hooks and eyes, snap fasteners, collar supports, thread and bastings and many other little articles, a nut-pick for removing basting threads, also a half-pound box of dressmaker's pins, which cost 35 cents, and which is a very convenient article for any home sewer. This table has no stationary place in the room, but is moved around wherever needed most. These items, together with a dress form and yard stick, constitute my sewing equipment used exclusively in this room.

A WORKSTAND.—I have a workstand which is so convenient I will add a description of it also. This is made of a cheese box and cover. The cover, inverted, makes a very handy tray for holding similar articles to those already mentioned, also darning ball, cottons, tape needles, etc., and a little bag is fastened to it for holding scraps. In the box below are kept pieces of the garments in use, so that patches will be convenient, also a box of tapes, and there is



CHEESEBOX SEWING STAND.

room left to hold many articles to be mended. This stand is usually downstairs and saves many trips to the regular sewing room.

EXTRA SUPPLIES.—In the clothes room connecting with the sewing room are a series of shelves, upon which are kept boxes of materials used in sewing, one each for ribbons, laces, nets, featherbone, belts and belting, collar supports and foundations, braids and tapes, discarded yokes, linings, new goods, patches, and left-over pieces. In the lining box are kept some crinoline both black and white, tailor's canvas, percaline in black and gray, buckram, India linon and white lawn. I have found that by keeping these things on hand it makes it quite easy to rearrange a dress, as well as make a new one. One shelf in the clothes room is devoted to odds and ends that do not pertain to sewing. A card upon which each article is listed hangs near. I hope that other women are not afflicted as I am by putting things away and then forgetting where they are. For this reason I make an effort to keep each kind of material in separate labeled boxes, and I find it saves me a vast amount of time.

CLASS OF WORK DONE.—Years have brought about quite a change in the character of my sewing; formerly it was mostly children's apparel and household items, now it is largely dressmaking for myself, household articles, with a generous amount of shirts, nightshirts and pajamas added by way of variety. The question of getting a dress made had come to be quite a problem. It required a number of trips to the village, and a great amount of fortitude to keep from "saying things" to the dressmaker when after I reached there, I was told that the garment was not ready and "would not be before next week." Added to this was the rapid increase in prices which were fast getting prohibitive.

THE DRESS FORM.—I talked the matter over with the dressmaker and she suggested that I get a dress form and then I could make my everyday dresses easier. I followed her advice, sending to New York for a form which cost $1.98 besides the freight. This was adjustable to different heights. I fitted a lining to myself and put it upon the form. The effect was anything but complimentary to me but after a while with patience and plenty of cotton "Mary Jane" began to assume my proportions. Then I found I had made a mistake. I had sent for the same sized form that I used patterns, and in places "Mary Jane" was larger than I, and I could not make her smaller. However I managed with this form until I had an opportunity to sell it, and then I got another two sizes smaller. This needed still more building, but now I have a form over which I can make a dress and feel assured that I shall get a reasonably good fit. Three other women sent for forms the last time, thus reducing the freight charges for each of us. From making the everyday dresses I have gradually come to the point where I now do all my dressmaking and even attempt an occasional coat. A number of years ago a little rhyme caught and held my attention so persistently that I committed it to memory and have since found it an ever present source of help and inspiration. I insert it here hoping that it may do as much good for at least one reader as it has done for me.

"Are you in earnest? Seize this very minute
What you can do—or think you can.—Begin it!
Boldness has power, magic, genius in it.
Only engage and the mind grows heated;
Begin, and then the work will be completed."

THE TAILORED SUIT.—If a suit is needed a blue serge, at $1.25 a yard, is very serviceable. Five yards of serge and 1½ yard of messaline, at $1 a yard, will be required. The two-piece skirts with flounces and the little jackets they are wearing this year are very easy to make, as they do not require the careful tailoring that the plainer ones do. This suit, made at home, will cost about $8. If a long coat is needed, a black and white shepherd's check with black trimmings and buttons, or a medium shade of gray does not show the dust. All girls like pretty gloves. One can get such nice, long chamoisette gloves for 50 cents. With a medium-sized black hat, trimmed with band of ribbon and "stick-up" of ribbon or flowers, two gingham dresses at 15 cents a yard, any young girl would be well-dressed, either for town or country.

MRS. W. W. S.

EDISON, the inventor, being hard of hearing, is obliged to see with his eyes. On a recent trip Mr. Edison saw a bumble-bee in flight, and watched it carefully. He said later that he had obtained an idea for a new form of flying machine. We shall have a real heavier-than-air machine when we obtain something that will beat the air at the rate of 200 times per second.

That bumble-bee was one inch long, three-eighths of an inch in diameter, with a wing one-quarter inch wide and five-eighths of an inch long. The wings weighed a milligram. That bee weighed 7,000 times more than his wings. If we can only get to that, get to that—the greatest thing for the smallest wing—that is the thing. The bee's wings beat the air 300 times a second. A bee works on sound waves. Remember the air is rigid as steel if the pressure is only sudden enough. Give us something that beats the air 200 times a second and we will have a real plane.

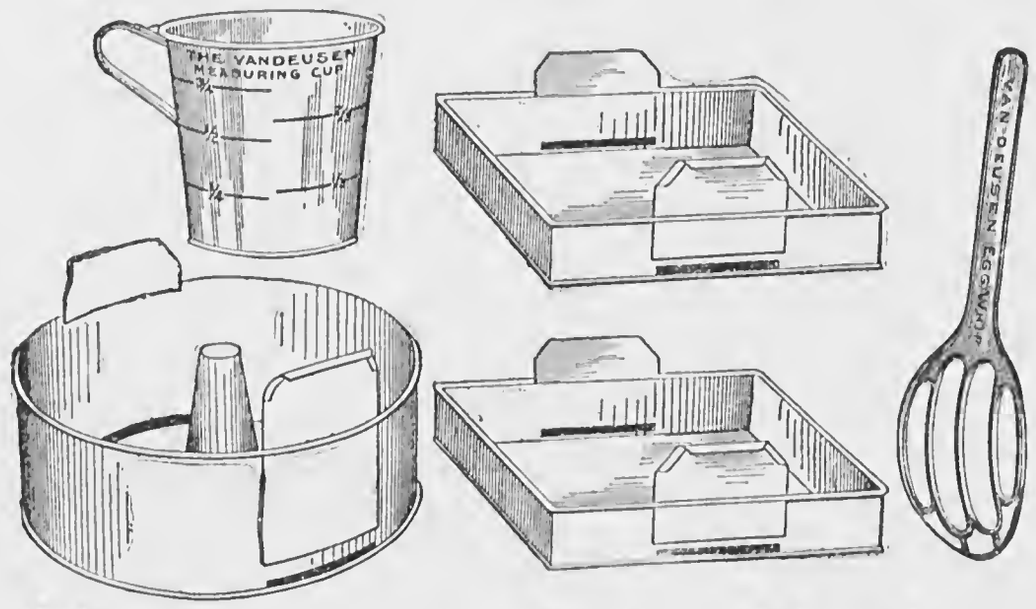
AUNT: "Why, Tommy, when I was your age a lie never passed my lips." Tommy: "When did you begin, auntie?"—Boston Evening Transcript.

A Special Offer to Cake Makers

Having any Difficulties in Cake Making, and also to the Progressive Ones who want to Practice this Scientific Method and Thereby have Better Cakes.

For One New Yearly Subscription or Ten 10-week Trial Subscriptions or Three Yearly Renewal Subscriptions (one of the three may be a renewal of your own subscription) we will send postpaid

THE REGULAR SET OF THE CELEBRATED



Van Deusen Cake Moulds

Consisting of 1 Loaf and 2 Layer Moulds, regular size—square—1 Measuring Cup, 1 Egg Whip, and a copy of the Scientific Cake Rules and Recipes.

This scientific method is to bake all cakes in ungreased moulds and let them stick, and loosen the cake from the mould, with a knife, when it is to be removed, each mould being provided with openings at the sides, which are covered with slides, through which the knife is inserted to loosen the cake from the bottom. By this method the mould supports the cake, while baking, and prevents its settling and becoming "soggy."

These Scientific Rules and Recipes tell exactly how to do each operation right, being so practical and comprehensive that, no matter what the "luck" has been in the past, success will be assured every time these instructions are followed correctly, and ANGEL, SUNSHINE and others of the most delicate, delicious and desirable cakes made easier than the ordinary ones are by the old methods.

This scientific outfit has been on the market for years, and the thousands of cake makers who have had them in constant use during all that time will vouch for the superior merits. Therefore, this is no experiment, and you are perfectly safe in accepting this offer. When ordering, be particular to give the name and address very plainly.

Dear Sirs:
We received the Cake Moulds and think they are just fine. Thank you very much. THE RURAL NEW-YORKER is a good friend of ours, and we like the new addition, the Woman and Home Department, very much. Yours truly,
L. YOUNG, Nauvoo, Ills.

Gentlemen:
The cake moulds were received. I am pleased with them for all kinds of cake made without butter or cream. When using butter, or cream I butter the moulds and have better satisfaction, and that, too, with less fleur. Sincerely yours,
MRS. WALLACE TRAVER, Rhinebeck, N. Y.

These articles will not be given with subscriptions—they are sent as rewards only (in place of cash) to our subscribers and friends who, acting as agents, send us subscriptions as indicated.

Your neighbors need THE RURAL NEW-YORKER. If they are not readers get their subscriptions. If they are subscribers get their renewals.

The Land of Fulfillment

A Story of Homesteading

By Rose Seelye-Miller

(*Continued from page 865.*)

CHAPTER VIII.

THE CROP OF A NIGHT.

"If we had room in the surrey, I'd take as many crates as you could make up," said Mr. Homer, one of their guests after a meal, in which mushrooms took a leading part.

"I'm going to Wetasket this afternoon," Nate put in eagerly. "We'll fix up as many crates as you think you'll want, and I'll take them in, and leave them wherever you say."

"Take them to the express office and address them to me, in St. Paul," and he handed Nate a card. "I like to see you young fellows out here roughing it, and making the best of things," for some way the whole of the boys' story had leaked out to these kindly strangers. Maybe they were hard business men in the city, but on the plains they had dropped their self-centrement, and had opened their hearts to the new country, the New West.

"I'll dispose of these mushrooms, and if you have further to sell, ship them and I'll see to the sale. If they'd rather have them in baskets or any special way I'll let you know."

"I wish you'd just take the mushrooms and use them; they haven't cost us a cent, and we've had just wonderful luck ever since we came, turning off the most unexpected things, buffalo bones, and horns, and——"

"The rest of the settlers haven't had any such 'luck,'" put in Mr. Mansfield. "It isn't luck; it's just the spirit to see a chance and grasp it and cling to it, and wrench every ounce of help out of it. I see a future for you fellows. You let Homer sell your mushrooms. He's no philanthropist."

A general laugh followed, and with a general handshaking the men drove away.

"This is the queerest country," Nate remarked for the 'steenth time, since he had first set foot on it. "If our expected crops turn as well proportionally as our unexpected ones—" Nate paused and helped Norm to collect baskets, and pails in which to gather the mushroom product.

"I knew mushrooms were profitable, but I never dreamed of a market. It only takes 12 hours for them to reach St. Paul, and the dew will hardly be off them."

"Was the mushroom seed in that wheat we sowed?" Nate inquired innocently.

Norm laughed immoderately.

"Nate, you are the gumpiest gump, when you set out to be. I suppose the spawn of these mushrooms has been lying here years—ten, maybe a hundred or a thousand—waiting for the upturning of the sod, and the rain, and the heat." The boys bent to the work gaily, but no day in the field had ever left them readier to stop than this one did. They made ten light boxes and packed about ten pounds of mushrooms in each box, and Nate drove off gaily for the 20-mile distant city. He had borrowed Hank Jones' light market wagon, and the horses covered the distance in less than three hours, reaching the express office only in time to turn his crates over and send them on their journey. He caught sight of Mr. Homer as he boarded the train, but there was no time for more than a wave of the hand.

The seeding went steadily forward, and by the middle of May the crop was all in, even to the sod corn. The land was yet to be broken for flax, but with the ox team and the horse team that did not seem a very strenuous operation. Arrow heads of flint and steel, stone hammers and bits of pipe were picked up, and went to adorn the shanties on the plains. The finding of each one seemed a romance and a revelation, for the Indians, like the buffalo, were driven from their hunting grounds, and either extinguished or shut up in government stations. The rains came as needed to force the crop, and the sun shone gloriously between whiles. The immense fields of grain all around and about upon the face of the plains lifted high heads to the blue, and made the prairie a billow of beauty. To Nate, who had hardly seen the country in his life, every rippling change was fraught with enchantment. He worked and toiled at whatever he found to do, and yet he had eyes for every beauteous change of the wind-swept grain.

"Heaven has come down to earth," Nate said solemnly one morning as he looked out across the field of blooming flax.

"It's there in all its color," replied Norm, standing reverently by Nate's side.

"How could I ever have preferred to work in the dingy city?" Nate sighed. "And yet it nearly broke my heart to leave that acid-fumed work-place."

"And I hated to leave my little garden patch in the woods," Norm mused dreamily.

"I s'pose it was because we never had known anything larger."

"It is *big* here," Norm agreed.

"It seems to me," said Nate, "as though one could almost see God's hand at work out here. Yesterday that flax was nothing but a mass of green, but with the touch of the morning—God's morning—upon it, it is transformed into a fruitful thing. I'm going to get a Bible to lay on the shelf," Nate said reverently.

"It would seem as homelike as the gingham aprons, and who knows, perhaps our lives are being wrought upon as wonderfully as that field of flax?"

"It is curious how we were wrenched away from the old things and brought to this."

"It is strange and mysterious; but we, who were content with our weekly or monthly wages, are now looking forward to help feed the world. It's a great work, a glorious and honorable work to plow, and sow, and reap."

The days swung by and the first of August burned upon the land. The grain that had been erect so long now stood with heavy heads hung down, laden with the richness of the Summer. The lower leaves had long since yellowed, and the stalks were being burnished like gold. Nate, Norm, Jim Maynard, Hank Jones and some others had bought, on time, a wonderful new machine called a header, and they were going to harvest their crops together. The oats, the barley, had been cut with a binder, and were standing in rich shocks over the fields. The time for the wheat harvest had come, and this harvest was to be begun on the field first sown by Nate and Norm, as that field, while not quite as heavy as Jim Maynard's, had seemed to ripen a little earlier.

"It will be our wheat to-morrow," exulted Nate as the two boys hurried through the evening chores, after a hard day's work in the barley field.

"I'm afraid it has shelled some already," Norm said, anxiously. "I hope it is still, for a wind now would thrash it out considerably."

"This is the dry season," said Nate easily. "It's been as hot as an oven to-day, and it's breathless to-night. There's no likelihood of a wind."

"We can't tell," Norm replied, vaguely prophetic. "It's often as still as death before a storm. But we'll hope. Let's turn in now; come, you'll rub the hide all off those horses, you curry them so much."

Nate gave a look of pride at his team, gave one more stroke of the brush, and turned away with Norm. A cool plunge in the creek refreshed them unspeakably, and they lay down on their blankets outside the shanty and fell asleep. Both were awakened about three o'clock by a dash of rain in their upturned faces. They gathered up their blankets and made a dive for the house, which seemed hot and breathless after the clear elixir outside. There came a roar of thunder and a flash of lightning, and then as the two boys stood, dazed, almost paralyzed with fear for their precious crop, there came a thump-thump-thump upon the roof of the low shanty.

"Hail!" gasped Norm.

"Hail!" re-echoed Nate, white-lipped and wide-eyed. "I wish the One who made the plains would protect them a little longer. Oh, Lord!" cried Nate.

There was no irreverence in the boy's heart or on his lips, and if the desire of the heart is prayer, then Nate prayed truly in that moment; and whatever the cause, the storm cloud drifted over with only a little rain to freshen up the burnt-out atmosphere. The grain waved its golden beauty in the morning, and the harvest went merrily forward to its complete end.

The glory and the gladness of those days to the settlers on the plains! They saw the fruition of their hopes and plans, and reaped some thirty, some sixty, and some an hundred fold for their sowing. Many a horny-handed young settler drove twenty miles to Wetasket, and went solemnly into the church there, to listen to the Harvest Home service, and dimly, unknowingly, perhaps, to render thanks for the splendor of the year.

After the steam thrasher had poured out its largess of bushels of grain, the boys found that, although the wheat price was low, it still netted them enough to pay all incurred expenses, and leave a goodly surplus for added machinery and other things for the coming year. The plows used for breaking would not answer for backsetting or real plowing, so a gang plow seemed essential, and with the coming of the gang plow more horses must be had, for little of the farm machinery is run with fewer than from four to six horses.

"I used to think that any fool could run a farm, and that it didn't cost anything, either," said Nate reflectively. "But it takes both mind and money."

All the Fall the boys worked steadily, plowing for early Spring seeding, enlarging their stable, and even fixed up the shanties, banking up around them and adding siding and real shingles over the tar paper, which had done good service the previous year. The straw stacks were burned in the fields to leave them clean for the plow, and the small stacks of hay which had been made seemed almost a foolish waste of time, as the previous Winter the stock had hardly touched hay, preferring the crisp buffalo grass on the open plains.

(*Continued Next Month.*)

This Fine Saxony Net Split Lace Curtain With Throw-Over Top

will be sent for Two New Yearly Subscriptions, or One New Yearly and One Renewal Subscription, or Three Renewal Subscriptions

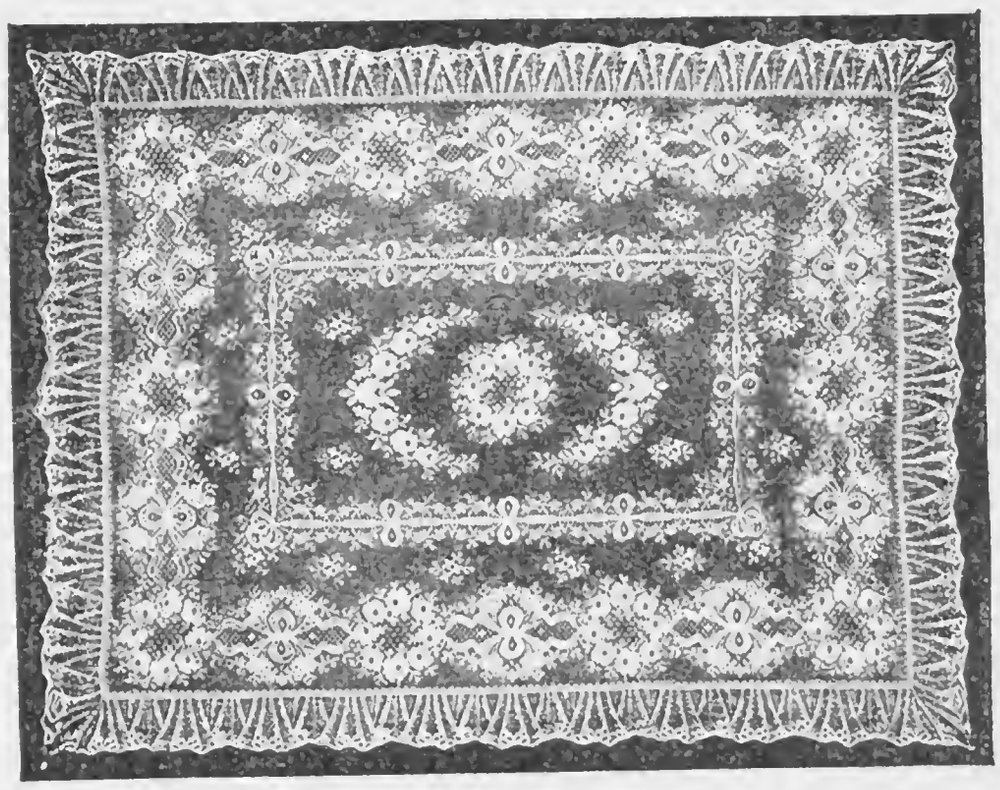
(One of these three may be a renewal of your own subscription)

The design is known as the Brussels and Bow Knot. Size: 3 yards long, 60 inches wide. Throw-Over at top, 36 inches. The curtain is one piece, but presents the effect of a pair of curtains when draped. The curtains are of good material, well made, overlocked edge and will stand washing well.

Bed Set Consisting of One Bed Spread and Two (2) Pillow Shams

will be sent for Two New Yearly Subscriptions, or One New Yearly Subscription and One Renewal Subscription, or Three (3) Renewal Subscriptions

(One of these three may be a renewal of your own subscription)



This Bed Set is of Saxony Net Lace, the Spread is 72 inches by 92 inches, the Two Pillow Shams are 36 inches square. The design is the famous Brussels and Bow Knot. The set is of good material, well made, overlocked edge and will wash well. The design matches the curtain.

A Complete Room Set of Curtain and Bed Set

above described, will be sent for Three New Yearly Subscriptions or Six (6) Renewal Subscriptions

(One of the six may be a renewal of your own subscription)

THE RURAL NEW-YORKER, 333 WEST 30TH ST., NEW YORK

Live Stock and Dairy

MILKING MACHINE.

"HERE is what the milking machine is doing for us," declared Earl Sparling, of Ashtabula County, Ohio, as he leaned over the hoe handle. "Father was able to get along without me while I attended Ohio State, and work is going along so nicely I believe I can get away and canvass this Summer and things will do pretty well without me. We used to keep an extra hired man, paying him $30 a month, when I was at home, then there was my father and my kid brother, besides. Now this hired man has been eliminated and we are using a deaf and dumb fellow at $12 a month, and getting along better. Father this year added to our farm about 60 acres, did a lot of tiling, planted 20 acres each of corn and oats, and we are getting ready for 20 acres of buckwheat. The work is running more smoothly than ever before just because the milking machine has enabled us to reduce our work to a system.

"This is the way we have planned our work. The kid brother, now 16 years, gets up the cows, has them in the barn at exactly five o'clock. Then he starts the milker. He milks the herd alone in an hour and empties the milk. Previously

A BUNCH OF WHITE-FACED BEEF CATTLE.

it required three of us to do this. While he is getting the cows and milking I get the horses from the pasture, feed and harness them, and have them ready for the field at six o'clock. We have breakfast at that time. While we are caring for the herd and the horses, father and the boy are doing other chores. Sometimes the man helps my brother strip the cows, but one does the milking all alone, and he has no trouble with the machine. It seems to be so simple there can be no trouble. In the evening the brother comes from his work early, has the cows in the barn at five o'clock and at six o'clock we are all ready for supper. The horses are cared for and the chores are done. There is not the drudgery about the dairy that there used to be. I just tried out milking the other morning and I handled the 20 cows myself and ate a hasty breakfast in one hour. I had my brother there to show me a little and help empty the milk, but I found the changing of pails, the moving about of the small individual suction pumps and the attachment of the teat cups not very difficult yet, though I was clumsy about handling the teat cups. The machine milks the cows practically dry, although we do check over the work with the pail. Father and brother think the cows are doing better than heretofore when they milked by hand. The machine cost us $182, including the engine, which is 1½ horse power. This is ample for the three units, one cow to the unit, and we have an extra pail with which to change. We had our driving rod sawed at the local mill, which slightly reduced the expense of the installation.

"When I graduated at the high school I was mighty tired of the farm, because I did not like milking, but now father and I have been talking over a proposition of putting on about 40 cows, read up the men who advertise purebreds, and when I am out of college next year we will make the milking machine serve us to its capacity."

Just then the "kid brother" came from the field, and he approved his brother's statements, and added: "I had no trouble with the machine from the first night. I like to milk by hand yet I would rather milk 40 cows with the machine than five by hand. We have had no expense on the machine, no trouble and our cows which are grade Holsteins, seemed to like the machine as well as I do. We have had the milker about four months and see no reason why it should not last for years. There is nothing to it, it is mighty simple, and for washing we have sisters, and they find it no hard work to wash the machine in connection with the milk things. We keep the parts in brine water after flushing, and twice a week give a thorough washing.

The father was asked his opinion of the machine: "Well, it is the greatest thing for the dairy farmer that was ever invented; it lets me out of milking, and I guess it has paid for itself."

WALTER JACK.

Transmission of Bovine Tuberculosis.

HAS it ever been shown that bovine tuberculosis has been, or can be, transferred from the animal to the human by using the milk from a tuberculous cow? L. V. D.

Indiana.

It is generally accepted among scientists best qualified to judge that bovine, or animal tuberculosis can be and is transmitted to humans, especially to children, through milk. The best evidence of this seems to be the finding of the germs of tuberculosis of the animal type in human beings, and this has frequently been done. It is, of course, impossible to inoculate human beings with the germs of tuberculosis from cattle for the sake of demonstrating the possibility of doing so, but when these germs which originate and belong in cattle are found in the tuberculosis areas within human beings, it is a fair assumption that they came from cattle, and this they could do only through the milk used as food. It is now believed that many, if not the majority, of cases of tuberculosis in adults owe their origin to germs which have been taken in with the food in infancy or childhood and have remained latent, or inactive, until later in life. There can be no absolute proof of this but the history of many cases seems to show the probability, at least, of it. M. B. D.

Increasing Butter Fat.

WHAT is the matter with my cows that they do not give better butterfat? I am milking four Jerseys and four Holsteins. Some have been fresh since October, 1913, some three or four months. I feed stock feed, two quarts to a cow, and have been feeding gluten feed one quart. Test fell below 3% and flavor was bad. J. E. D.

Orange Co., N. Y.

The feeding and care of your cows has little or nothing to do with the richness of their milk. The amount of butterfat in a cow's milk is determined by the nature of the cow and cannot be materially changed by any method of feeding or by any kind or quantity of feed. It seems strange that a mixture of Jersey and Holstein milk should drop below 3% in butterfat as the Holstein milk alone should equal that percentage and the Jersey milk should exceed it. With such cows as you describe, I should be very suspicious of the accuracy of a test that registered below 3% in butterfat. Can you not have a fair sample of the mixed milk tested at some other creamery or by entirely disinterested parties? The milk should be mixed immediately after milking and the sample taken before any cream had separated. I agree with you that your milk should test 4% or better, and it should test fully as much on pasture alone as with grain feed. A bad odor to the milk is evidence of something in the food tainting it, of lack of cleanliness in the utensils used or of absorption from bad odors in the air. If your cows cannot obtain access to tainting food the cause of the odor must be looked for in the care of the milk or the utensils containing it. Only a careful investigation can determine the cause of the trouble. With cows on good pasture the probabilities are that this milk absorbs its odor from something with which it comes in contact. M. B. D.

EMERGENCY FARM HARNESS.—Every farmer needs an extra harness, and there are few farms without old hames, straps, and enough parts to more than build a harness, but the most serious question is that of tugs. Chain tugs are cheap, about 65 cents a pair at the local hardware, but then comes the question of how to protect the horse from the tugs rubbing the animal. That's easy. There probably is an old bicycle tire in the granary, and if not, a neighbor boy has one that has been discarded. Just chop the tire in two equal lengths with an axe. Slip each half over the chain and fasten the part by passing a cord through the tire and a link, and let the tire extend back past where it will rub the horse's sides. I know a farmer who made a harness of an old set of hames, some old straps, chain tugs and a bicycle tire. This harness has done efficient service for several years.

QUIET DRIVING.—It is not always the man who crowds the team to the limit who gets the most work done. There is a young man in the neighborhood who does much day work. He is particularly popular with one farmer because he drives the horses to and from the field on the gallop. He is continually yelling at the animals, and when he is using a team everything is on the jump, and the excitement is about as keen as it is on a Wild West reel in a motion picture theatre. We have used the young man, and comparing him with the hired hand we now have find that with all of his useless "hollering," his running the team, tearing to pieces wagons and sleds, he does much less than the present hired man. The team accomplishes more work with greater ease and on less feed than under the day hand. W. J.

Ohio.

Fur-producing Sheep.

IT will be surprising to learn that an American agricultural college is willing to go to war for the sake of sheep. The Kansas Agricultural College has sent one of its experts, Dr. R. K. Nobours, into the heart of Central Asia. He will be accompanied by a guard of Russian Cossacks, as the journey is one involving danger and privation. Dr. Nobours is sent to Asia to study fur farming. The object is to learn how to make fur grow on a sheep's back in the place of wool. The Karakule breed of sheep produces such a fur, and when these sheep are crossed upon our native breeds we have a sheepskin which when properly handled will take the place of some of the wild furs, which have long been used as Winter garment for human beings. Two years ago we had a series of articles on this fur farming as started in Texas. The business has developed well, and it has been demonstrated that crosses of the Karakule sheep on some of our improved breeds would really give us a substitute for Persian lamb and astrachan fur. It is well worth the expense and danger of such a trip to learn how these fur-bearing sheep are handled, and to bring some of them home.

As all know, the wild fur-bearing animals are being rapidly exterminated, while the demand for fur garments grows faster than ever before. The result is inevitable Fur-bearing animals must be grown in captivity, or, at least, under human control in order to keep pace with the demand for high-class furs. Thus we have reports of skunk farming, fox farming, and mink farming, for the purpose of breeding and rearing these fur-bearing animals. We also hear of cat farming, in moist and cool countries where pure black cats can be raised to produce a thick and heavy fur. The future promises fair returns in this fur farming, and we shall probably be obliged to look to cross-bred sheep for a large proportion of fur garments of moderate cost in the future. It is remarkable how the demand for furs is increasing. In describing the costume worn by a party of rich and beautiful women at a reception in New York recently, it is said that one of them wore a magnificent skunk-trimmed cloak, which, of course, meant a cloak trimmed with the finer fur from skunks. Thus we have an animal degraded and despised in the country, forming a part of the most beautiful costume which the city belle could think of.

New Jersey Pigs Sold Abroad.

TWO little pigs tell a fine story of New Jersey's high place in the development of anmial industry. They were members of the handsome herd of Duroc-Jerseys at the State Experiment Station, New Brunswick, until D. Nikitin, of the Russian Imperial Department of Agriculture and S. K. Lissogosky, chief of the Russian Station of Animal Husbandry, saw them and bought them for the Czar's special farm. These Russian officials have been on a tour of the various State experiment stations in the United States, obtaining data for use in Russia in establishing similar stations there. They were especially impressed with the work on the New Jersey State Farm, and particularly with the departments of swine and poultry. The two little Duroc-Jerseys sailed July 4th, and will be followed later by several specimens of poultry. From this it appears that while Europe raises much more per acre of cultivated land than we do, our animals and poultry are of such superior quality that they are imported for breeding purposes. We do not know all that is known in Europe, but we excel in some things that are of great agricultural value and importance. D. T. H.

New Jersey Cattle Breeders Incorporate.

ARTICLES of incorporation have been filed at Trenton by the Somerset Holstein Breders' Corporation, a concern cern formed by stockmen of that county to breed and sell Holstein cattle. The corporation is capitalized at $500,000. The corporation has taken over six large farms along the Raritan River, comprising almost 1,000 acres, together with several herds, numbering about 200 head of registered cattle. Included in these herds are several record-holding Holsteins. The corporation's charter also provides for the promotion of manufacturing and power interests in connection with water rights. The officers of the corporation are: President, Albert A. Cortelyou; vice-president, Bernard Meyer; secretary, Jacob Todd. Judge Clarence E. Case is also interested in the concern.

When to Cut Ensilage Corn.

WILL you inform me how a person of limited experience can determine just the proper time for cutting silage corn for the silo, and also if such corn where juicy should be wetted, and how much? My silo has no drain in the bottom. J. W. V.

Schenectady, N. Y.

Usually the best time to cut corn for the silo is when it would be cut for shocking and husking. That means when the ears are well formed and the kernels are well glazed over. It is not always possible to wait until any particular time. An early frost may threaten or the silo filling machinery may be ready at a certain time when the work must be done. We would rather wait until the ears are well filled with kernels, but in your latitude the corn may well be in the silo by September 15. "Juicy" or green stalks will not need water.

Bog Spavin.

I HAVE a colt three months old; he has a rather large swelling on one of his hind feet at the knee. It is very soft. I have used two bottles of liniment, but it does not make much of a change. Is there anything that can be done for it? P. M.

New York.

This condition is a distension of the capsular ligament of the hock with synovia (joint oil,) or it may have came from infection of the navel at birth. Paint the joint with pine tar and let the colt run out on grass. Renew the application as soon as it wears off, but do not use the tar too often, or it will take the hair off clean. This may lead to reabsorption of the excessive fluid by the time the colt is a year old, but such conditions are obstinate and unpromising. A. S. A.

Eczema.

I HAVE a cow, a Jersey, four years old, due to come fresh in September; am milking her now. The skin on the udder has become thick in spots, and afterwards it comes scaly, then scales peel off, leaving bright patches; and still hard. Can you give me a remedy?

Virginia. B. S. D.

Cleanse the affected spots once and when dry paint with tincture of iodine; then apply lanolin twice a day to soften the skin. If the trouble persists use benzoated oxide of zinc ointment once a day. Keep the cow off dirty floors or places where she may infect her udder. A. S. A.

Splint.

I have a driving horse, weighing about 1,100 pounds that has a bump on each front leg that I think is a splint. He is not lame on the left side, but limps some on the right leg when he trots. Could you advise me what to do, and whether he could be left in the pasture or would have to be tied in the barn? L. E. B.

Wiscousin.

Clip the hair from the splint and around it. Then blister the splint by rubbing in a mixture of one dram of biniodide of mercury and one ounce of lard. In three days rub lard on the blistered part and repeat the application of lard daily until the skin is sound. The blister may be used again in three or four weeks, if the lameness persists. The horse should be rested while under treatment. A. S. A.

Brittle Hoof; Eczema.

WHAT do you advise for a horse's hoof that is dry and brittle? 2. What can be done for a mare four years old which every Spring, about the time she is turned to pasture, swells up along the abdomen about a foot long and as thick as one's arm? It gets pimply and yellow water runs out. If it requires internal remedies, can they be given to a mare in foal? W. M.

Ohio.

1. For brittle hoof give the following treatment: Mix together two parts of oil of tar and one part of oil of balsam of fir and apply to the juncture of the horn and hair of hoof every other night. In six weeks the hoof should hold nails; then apply twice a week. 2. Keep the mare off grass, as it disagrees with her and causes eczema. Keep the mare at steady work and feed light laxative rations, without grass or corn. A. S. A.

This is not a dairy section, being mainly devoted to what is called general farming. Several, however, make milk production their main object; one selling direct to customers gets eight cents per quart, and one selling direct to a hotel 4½; a third selling to a peddler 3½; others selling to a creamery receive 2½, all of which offers a splendid illnstration of the lack of coöperation and organization among farmers. Compared with previous years there is very little difference in these prices. Pastures are very short, and have been all Summer; cows having to be fed as about in the Winter. The cows are mostly grade, with a tendency to weed out the poor ones and substitute Holsteins. There is no noticeable interest in any effort to improve herds by using purebred bulls. Personally, I do not believe there is any profit in producing milk at these prices under these conditions; but, as it brings in a steady income the process is continued without going into the details of cost. The severe droughts of the past five or six years have practically ruined the pastures and made reseeding almost impossible; in many cases the work having to be done over and over again, and still no catch. The hay which has just been gathered was exceedingly thin; a smaller crop even than last year.

Lake Katrine, N. Y. W. T.

Markets in this vicinity are generally local and not influenced by outside values except where produce is shipped out in car lots. This applies to fruits, such as apples, pears, prunes (dried) and an occasional car of hogs, all of which are subject to values as found in the open market. Garden products have a very limited market, mostly disposed of in "trade" with the storekeepers, hence have no established rule of prices, not even the "supply and demand" rule, as the storekeeper usually pays what he thinks he can sell for, in a community where the majority grow their own vegetables. If one has for disposal produce grown exceptionally early, like elsewhere, he can get a fair to good price therefor. Horses sell all the way from $40 for a plug to $400 for a well-matched team. Milch cows from $40 to $65 each. Sheep from $3 to $4.50 per head; pigs $1.50 at weaning, except where purebreds only are handled, which bring about $10 each. Larger seven to eight cents per pound on foot. Butterfat 25 to 26 cents per pound at the creameries, which pay expressage at these prices. As elsewhere these prices vary at different seasons of the year. Hens (fat) 14 to 15 cents per pound. Wheat, barley and oats not yet on the market. F. P.

Canyonville, Ore.

A SCHOOLBOY recently wrote: "Much butter is imported from Denmark, because Danish cows have greater enterprise and superior technical education to ours."—London Farm and Home.

Office, 50 Clinton Ave.

Purebred Registered

HOLSTEIN CATTLE

The Wisconsin Farmer notes that fewer and fewer of the Wisconsin farmers are content to milk and care for cows that are able to produce only about 150 pounds of butter. During two weeks last Spring 145 Wisconsin dairymen purchased registered purebred Holstein sires in order to improve their herds.

Everywhere the more progressive dairymen are alive to the necessity of using **bred-for-production** sires in order to bring up the butter-fat yield of their cows to a profitable figure.

Day after Day, Year after Year,

PRODUCTION COUNTS!

It is not what a cow can produce in 7, 14, or 30 days, even in a year that determines her value to the farmer. It is what she can do in a lifetime.

Brown Swiss Cows rank high in average production and are regular and persistent breeders and producers. Year in, year out, they make good records and raise good calves without any coaxing or pampering. If interested, we will send you an illustrated booklet.

The Brown Swiss Cattle Association

IRA INMAN, Secretary BELOIT, WISCONSIN

That Child of Yours

What Training Is He Having

The Hen With One Chicken.

Do you remember, in one of the school readers, about the white turkey that died and left her orphaned child to the tenderness of a cruel world? The old Dorking hen with her brood of 11, and the duck, and goose, all offered to accept the little poult; but the hen with one chicken was too busy by far, and bitterly resented the attitude of the others because they seemed to think she had little to do. That fable did not appeal to me until I had a brood of four. Then I began to see that if any woman was fitted to raise a family by receiving the divine gift of perfect child-knowledge, it was the "hen with one chicken," or else the one with none at all. The only difference I have been able to discover is that the mother will admit that mistakes can be made, and the childless woman candidly tells you that everything you do is a mistake! Why these female founts of wisdom are not entrusted with 10 or 12 children, remains one of the mysteries. No doubt there is one of the causes of social degeneracy.

Have we not all heard the childless woman say: "If that was *my* young one, it would act differently!" or "I never in my life saw a creature so little fitted to raise a child as that Blake woman!" The funny part about it is that she is sincere in her ignorance, and sometimes becomes so exasperated at the shortcomings of women in general, that she adopts some foundling and proceeds to theorize. Then, if she makes mistakes, it can be laid to the criminal tendencies of the unknown parents. Very comfortable arrangement.

The first baby in a family is usually a sort of experiment, for young parents are anxious to do the right thing. Having done their best, they credit themselves with the baby's growth and good nature. Therefore if the one child is the only one as well, it is natural for the mother to consider herself an authority on child culture, for she never finds out that a second child's disposition demands an entirely new set of ideas.

It is said that children invariably reflect home training. This may be true in some cases, but most children have a very generous touch of Adam in their make-up, and even the most well-trained youngster turns to and upsets the universe, leaving its parent weak with amazement. One such child was heard pattering down the stairs one night after bedtime, and the mother with a rapt look, said: "Here comes Billy, people; just listen what he says, for a sleepy baby is so near the angels, that their bedtime messages are almost sacred!" The door burst open to admit Billy, starry-eyed and flushed with the wonderful news, and he shouted, "Mamma, Mary found a bed-bug!" We considered that a matter of house-cleaning, rather than child-training.

One thing is very certain: The more children a mother has to train, the less assurance she has of her own ability, and she rarely offers advice to other mothers; but the hours a childless woman preaches advice, and the reams she writes on the subject, might lead the unsuspecting to believe that mothers are the most senseless creatures on earth. Our little ones must endure the knocks and blows of the foundling, their morals may be tainted, and school-going made a nightmare to both pupils and parents, yet no word of disapproval dare leave our lips, because the woman who has theories, has also a tongue particularly adapted to quoting Scripture about the persecution of "the fatherless and weak."

Many a good woman longs for children, though physical defects bar her from the joy of having a child. To those unselfish hearts have prompted to give a home and love to some unfortunate child, or children, must come life's richest blessings. The woman who voluntarily takes the responsibility of a tiny baby to raise as she would her own, for love's sake is one that never finds fault with the flesh and blood mother. It is also noticeable that such children grow into the useful citizens in later years, when the child that was taken at six, or eight years (after the bothersome age!) to theorize on, is enjoying the distinction of being the village hoodlum. If we real mothers could only have a little less condemnation, and a greater amount of praise for the honest efforts we make toward raising our children right, it would lighten many a grief and be a much more comfortable way to dwell together in unity. MABEL B. CASTOR.

Fear Not the Face of Man.

TEACH COURAGE.—The woman who has no children is said to be the one who always knows how to bring them up, so here is a suggestion from "one who knows how." The suggestion is prompted by observing the feelings of two elderly people during a thunderstorm. To one, any electrical storm brings fear. To the other, such a storm has no terrors, unless it is very severe, and even then, the fear is largely controlled, and thus is not increased by its indulgence. Now why is this? There may be some difference in temperament, but a knowledge of the up-bringing of these two people

A PROMINENT MEMBER OF THE APPLE CONSUMER'S LEAGUE.

would seem to give the key. The mother of the first was afraid in a thunderstorm, and freely expressed her fear in the presence of her child. The mother of the other never expressed any fear, as far as can be remembered, except in two instances, when the storm was of intense severity, and even then, there was no outburst of alarm. The result of these two methods naturally shows in the lives of the children, even to old age, giving much suffering to one, and much comfort to the other. A mother and daughter were sitting together during a heavy thunderstorm, and on speaking of it afterwards, the daughter said, "I began to be afraid, but I saw that mother wasn't, so I thought it wasn't worth while." As a matter of fact, the mother *was* afraid, but did not think best to allow herself to show it. To a mere on-looker, it seems cruel to a child to bring him or her up to be afraid of anything, more than is absolutely necessary. Fear can be controlled until, as the years pass, it ceases to exist, except in extreme danger, or it may be indulged until it is a source of untold suffering throughout a long lifetime. ELIZA F. MILLER.

Children and Property Rights.

There are too many children nowadays who have very little, if any respect for the rights of others, and I believe it is the fault of the mother. We find in the homes, mothers who have assumed the full burden of household duties, causing the children to feel that mother has no rights of her own, but is there to wait on, and slave for her family. The new clothes are bought in many a home for the children, while mother wears the old. The good times are all planned for the children, and by them if they are young men and women, and in these homes, they seldom think that mother might like to get away from the everyday drudgery of household cares. Shall we teach our children that because we are not known by the other people in a train or public place, they may have full liberty to make as much noise as they wish, to run or push or crowd others? It has seemed to me this was the attitude of some mothers I have seen. I was traveling with my two little girls one day, and amusing them with stories and a picture book for the four hours' ride. A little child about four, sitting two seats in front kept running the whole length of the car, grabbing the arms of the seats and jumping until all in the car were tired of it. At last she stopped at our seat, where I tried to amuse her for a few minutes, but she pinched my baby until she cried, and annoyed us so much, that I asked her to go to her own seat for a little while. She only stayed a few minutes when back she came, and I was very glad when we reached our destination. Through it all the father and mother sat in their seat asleep.

Let us, mothers and fathers, start early with our little ones to teach them to practice the golden rule, no matter where they may be. As soon as the little ones can have things to play with they should be taught that some are their own, and others belong to brother or sister. Each member of the family should have a place for his or her things, and no other member should use them without asking the owner. Begin when they are tiny and steadily day by day, train them to respect the rights of each one in the home. Slipshod methods will never bring results, and deceit may easily be taught unless one is very careful. Sometimes mothers say to a child, "You may take sister's things while she is gone," and if some time you find your own things have been molested while you were away, you have only yourself to blame.

There are some people who seem to think this earth was made for the benefit of their children. They are allowed to meddle with other's things, even to take things to pieces to see how they are made, picking up to look at fragile bric-a-brac, and generally snooping in other's homes. If children are taught in home to leave other's things alone, it will have much influence on their whole lives.

In teaching that each must have his or her own things, we must guard against selfishness, but in the beginning we may teach them easily, to divide or lend and each feel happier for it. Where the parents are living very close to their children, they are ever guiding by precept and example. It is the children who are pushed off, left to care for and amuse themselves constantly, who are lawless and a source of trouble to everyone around, or have no respect for the rights of others. A MOTHER.

Burned Bone for Children.

FIFTY years ago I lived in Argentina, 50 miles west of Buenos Aires, for six years. I noticed that the farmers had very fine teeth and hair, hardly any bald heads. The reason? They lived nearly exclusively on meat, mostly mutton, boiled or roasted on the open fire; seldom vegetables, never potatoes, sometimes twice a day a biscuit weighing one ounce. The water contained much lime. I supposed that this water made the strong, healthy teeth and hair, as both are related creations. I thought I was justified to recommend the use of burned, pulverized bone to use for little children, to be given in mush, rolled oats, or otherwise. I would like to know whether powder made out of burned bones could hurt a baby when given with the food, and if it will be digested in the stomach? Are not they using bone meal to cure young, growing animals that are weak in the legs and bones? M. V.
Oregon.

The only practical result of administering pulverized, burned bone to children would probably be to upset the digestion, if given in any considerable quantity. We are not dependent upon the lime in drinking water for our supply of lime salts, as these are abundant in the common foods and, except in certain morbid states, as in the disease called rickets, growing bones are supplied with all these elements that they need. In rickets certain lime salts are administered in very small quantities in connection with other drugs which stimulate bone formation, but even in this disease, correction of faulty hygienic conditions is more relied upon than administration of lime directly. M. B. D.

CITY life is full of comedy and tragedy. Here is a bit of the latter which is not an unusual occurrence. A policeman walking through a New York street at noon saw a baby climbing on the window sill of a five-story house. This policeman was about 40 feet away when the child lost its grasp and fell. The policeman ran with all his speed, but he missed the little fellow by two feet, and the child was instantly killed upon the pavement. It appeared that the child's mother had gone into another room for a moment, to get her pocketbook to pay a bill, and during her absence the baby climbed over the window sill to its death. That little one would have been far happier and safer, could he have spent his life playing in a garden or in some green field on the farm.

WHAT TO KNOW.—Down in the village there is a little lad of seven or eight who cares for nothing in life except "jogger-fry." He reads constantly and everything he can get on the subject, and goes about asking busy mothers, for instance, such questions as, "How much of the earth was known at the beginning of the seventeenth century?" Could you answer that question point blank? I couldn't. The wise woman says there are two ways of knowing things, to remember what you need to know and to know where to find the other things. The highest practical wisdom seems to be to know what is necessary to carry in your head. The more I think of her words, the wiser they seem to me. It isn't necessary to one's work to know how "much of the world was known at the beginning of the seventeenth century" if there is a book on your library shelf to tell you in case of need. Far better to know how to give first aid in a drowning accident when occasion offers. K.

AT THE FAIR THIS YEAR

WHEN the inviting shade of the big SHARPLES tent beckons you inside, slip into the welcome arm of a big, comfy chair in a cool corner—and while you rest your tired feet, watch the SHARPLES MILKER milk your neighbor's cows.

Smoke if you want to—the ladies don't mind. Relax and get all the good out of your little recreation trip. Feel that this big exhibit is *your* show—because we have gone to a lot of trouble to make these exhibits both interesting and instructive—but, after all, comfort is the thing which intensifies all our pleasures.

If you are interested in dairying—and everyone is nowadays—here you will find food for thought. Cows strange to the machine will be milked at regular intervals. Here you will learn, in a few minutes, why the SHARPLES MILKER is now milking a quarter million cows. You can see the reason for its remarkable success instantly. Better still, you can talk with farmers and dealers who have shared in the upbuilding of that success—undisturbed.

The things a man finds out for himself are the ones most worth while to him. People learn—they are not taught nowadays. Farmers have a way of doing their own thinking. And if an article does not possess merit you cannot make them believe that it does. And, on the other hand, if it does possess that merit, you can't keep them from finding it out. We investigate and "*buy*" things in this progressive age. Farm implements are no longer "sold."

Every member of the family is interested in the MILKER, it seems. And it is right that they should be; because if a man can use a MILKER and it will do him good, the sooner he knows about it the better. We cannot put off the inevitable—and why, then, should we try? If a man can't use a MILKER it won't hurt him to know about it, because it is a big, new idea. But if he can use it, now or any time, why deny himself so good an opportunity of seeing it?

Clarifiers will be shown, too, and gasoline engines. And Separators, Whey Machines, and much else which interests the dairy fraternity.

Something Happens Every Minute at the Sharples Milker Show. It's really interesting! You will be delighted with your visit—and so will we.

AGENCIES EVERYWHERE

CATS AS FARM STOCK.

OCCASIONALLY I see in THE R. N.-Y. a discussion of cats. As is usual in a discussion of any subject, some persons are strongly pro and some are strongly con. Personally I am for the cat, not that I dearly love a cat, though the cats and I are upon nice friendly terms, but largely because they are useful to me. For instance, we have a large three-story barn. When the mows are full of hay and straw, the loft covered with corn stover, the granary containing oats, rye, buckwheat, etc., and finally perhaps the barn floor and all available space stuffed with shocks of corn brought in from the field to await their turn to be husked, then, you see, we have a lovely place for rats and mice, and, I assure you, the "varmints" do not fail to discover such excellent quarters. If left long undisturbed I fully believe these pests would actually "eat the barn down!" At any rate the rats once gnawed several holes through the shingles of our barn roof, and were in a fair way to spoil the foundation of a large silo. Since then we try to keep at all times four to six grown cats. These cats are fed with moderate liberality *at the barn* and are encouraged to stay there. These cats have the same care as any of our farm animals and are regarded by us as farm stock, as a part of the necessary farm equipment. Any dog found bothering these cats is promptly dealt with. This includes our own dog. Neighbor or strange children who do not know our views upon the subject are carefully but pointedly told that there is to be no stone throwing or other abuse of this stock, just as we would show them that running the cattle or throwing apples at the colts is not good business. More than that, our own children are at no time, from babyhood up, allowed to maul or pester the cats, or any other animal, but are carefully taught to talk to them, stroke them and be at all times friendly and kind to them. This we consider good business, because it is good for the cats and, what is more important, is excellent for the children. As to results, we have cats that come to meet us at any time, literally with smiles upon their faces. They come with tails erect, mewing, purring and telling us as well as they can that we have been good to them, that they like us and are glad to see us. This, coming from even a cat, is to me a pleasant thing, and fully repays me all kindness shown them.

As to their board and lodging I could not say how many times over it is paid, but I know this: At no time for years have we had rats or mice in our houses or barn to any serious or near serious extent, and, as a rule, it is at intervals of weeks, even months, that I see a rat or mouse or even evidence of one, now and then I find the hide of a rat lying some place and that is about all. Moreover, our cats give attention to fields outlying the barn for a good distance, and bring in literally hundreds of the short-tailed meadow mice. This, I feel sure, is a splendid service, since we mulch young fruit trees as fast as set out, also small fruits, grapevines, etc.

There are some objections made to cats. They kill chicks. In 40 years life on the farm I have known *one* cat to do this. The gun promptly cured him of the fault and he has had no successor in 25 years. Again, they kill birds. I am reluctant to admit that they sometimes do this, and I am sorry for it, since I am also strongly for the birds. Upon that point I have this to say: For over 20 years I have been an observer of birds as found in my home locality, being more or less familiar with some sixty varieties. This being the case, I should be likely to notice if cats were making any bad inroads upon birds. This is the sense of my observations. In the early months of the Summer, when young birds are maturing and leaving the nests, now and then something will frighten the young and cause them to flutter from the nest before they are fledged enough to fly. Cats are likely to get these as they have little to do but pick them up. I might say that such birds would in many cases perish anyway. As to adult birds, it is rarely that my cats get one. Considering the numbers of birds that are about all the Summer months I should say that the per cent. killed by the usual cat would, to compute, take you deep into the fractions of one per cent. I suspect that by catching an occasional pine or red squirrel the cats of my region save many more birds than they destroy. And finally (I fear I shall say something a little "mean" now) those persons who condemn cats as bird-killers, have they, perhaps, some boys? Have these boys any kind of guns? Have those persons seen to it that these boys do not in a Summer shoot more good birds than the cats will kill in a lifetime? Further, it is declared, cats carry disease, upon this point I have observed nothing, considering that disease, largely speaking, may be conveyed in almost any way, I suppose it might be carried by a cat, but when a half dozen reasonably thrifty cats make their home at a barn in the country, and seldom or perhaps never go beyond the bounds of the home farm, they may carry disease, but I will have to be shown. Therefore, as a matter of good business keep some cats.

F. A. M.

Lame Shotes.

I HAVE 51 head of shotes on Alfalfa and Alsike clover pasture, four to five months old, 40 to 85 or 90 pounds apiece; lime and charcoal at all times before them. We feed one basket ear corn morning, a small feed of middlings at noon, with a gallon and a half of 60 per cent. tankage mixed with water, and one basket corn at night. I see two or three of the hogs go lame in their hind legs and limp; they have always been thrifty and hearty to eat. What is the trouble? F. A. L.

Frankford, Del.

It would seem that F. A. L. is feeding a well-balanced ration to his pigs, for ear corn with 10 per cent. of digester tankage, and a small amount of middlings as a supplement should supply the necessary food nutrients. It is my judgment that lameness of the three animals can be traced to an injury, and not to the feed. Oftentimes animals running at pasture are quarrelsome, and do more or less scrapping, and we have found that such lameness can be traced to one or more individuals that are especially ugly, and inclined to rule the ranch. It would be well to make sure that the sleeping quarters are easily accessible, that there are no deep wallow holes for them to climb out of or step into, that the colony houses, if they are in use, are not overcrowded, and in addition add some bone meal, to the charcoal-lime mineral mixture that you are feeding. F. C. MINKLER.

Cutting Down Roughage.

I AM buying dried brewers' grain at $1.10, and am feeding it straight with the exception of a little bran. Good clover and Alfalfa hay cost me about $1.20, and it is hard to get it good, so I try to feed a little heavily on grain, swelling it before feeding to save hay. Grain is cheaper for me, bran $1, middlings $1.20; oil meal, $1.90; hominy feed, $1. Will you advise a ration?

Illinois. W. A. P.

A mixture of two parts by weight of brewers' dried grains and one part hominy feed will give you good results during warm weather, and while your cows will need some hay, the grains will be very bulky and can take the place of hay to a considerable extent. I think you can cut down the roughage to half what the cows would ordinarily eat, if you increase the grain proportionately. During cold weather, or if the cows do not keep in good flesh, increase the amount of hominy feed. C. L. M.

Preparing Corn for Hogs.

IS there any difference in the value of corn that is fed to hogs, whether whole, ground, cooked, or cooked and fermented? J. J. D.

Vermont.

For feeding swine weighing more than 50 pounds there is no advantage in any method of its preparation sufficient to justify the cost of such preparation. The best results will follow where the corn is fed on the ear, provided it is supplemented with some protein carrier, preferably digester tankage. It has been demonstrated by experiments that it is a disadvantage to cook or ferment corn, and grinding does not justify cost. Shelled corn soaked for 12 hours will increase its palatability for young pigs, although it should not be soaked longer than this period for fear of souring, which would decrease its palatability. The tankage suggested as a supplement with corn can be fed to the extent of 10 per cent. of the ration, and given to the animals in the form of a thin slop, previous to the time of feeding the ear corn. Some one has said that pigs like to hear the "crackle of the corn," and that their grinding machines are far superior to those manufactured commercially.

F. C. MINKLER.

AILING ANIMALS.

Cow With Cough.

WILL you advise me with regard to a Jersey cow we purchased last Spring? She had a slight cough, which seems to have become rather worse. We have had her tested for tuberculosis, but she tested out all right. She is in the pasture all day and in the barnyard at night with a chance to get under cover if it rains. I think the irritation is in her throat, as she begins to cough nearly every time she is lead by the strap around her neck. S. E. S.

Massachusetts.

Halter the cow and lead her by a halter rope which does not irritate the throat. Tuberculosis is strongly to be suspected in such a case, but actinomycosis of the glands of the throat possibly is present. Have her tested again, with a double dose of tuberculin, when the weather becomes cool. If she does not then react we should advise blistering her throat and administer two or three times daily a cough paste to be had from the local graduate veterinarian. A. S. A.

Lump Jaw.

A COW has had a hard swelling on the left side of the jaw, about the size of an egg, at the largest, and also a swelling of the lower eyelid on the same side. Both came about the same time and have been of about four weeks duration. The swelling on the jaw has broken lately and is much reduced. Cow is perfectly well otherwise. What can be done for her? T. R. H.

Maine.

Actinomycosis (lump jaw) probably is present and if the bones of the head become badly involved the case will scarcely prove profitable to treat. The diseased mass should be cut out and the wound cauterized; afterward applying tincture of iodine once daily until healed. Apply the tincture to the swelling under the eye, every other day and do not use the knife unless a considerable growth forms and discharges. If the cow is not in calf she may have a dram of iodide of potash in water twice daily for several periods of 10 days with 10 day intervals between periods of treatment; but this medicine dries up milk flow and causes emaciation and scurfy skin. A. S. A.

Sheep Grubs.

WE have recently lost one sheep with what is known as "grub in the head" and fear that others in the flock may be similarly affected. Is there any cure for this? If so will you give, in your columns, method of treatment and medicine to be used? M. E. B.

New York.

By "grubs" we take it you mean those of the sheep gadfly which inhabit the nasal passages and sinuses of the head. If so they rarely if ever cause death; but they may occur along with other ailments and the combination proves deadly. For instance one finds sheep infested with stomach worms or tapeworms, nodular disease of the intestines and gadfly grubs at the same time. There is no specific cure for grubs. They grow from small larvæ deposited in the nostrils of sheep in Summer and the flies may be prevented from this pestiferous work by daubing pine tar on the noses of sheep during fly time. Some shepherds claim to get good results from pouring medicine into each nostril in turn, the sheep being laid on its side and the nose turned upward during the operation. For this purpose they use a mixture of equal parts of kerosene or turpentine and sweet oil. It also is possible to operate for the removal of grubs, but the operation scarcely pays. A line is drawn down the middle of the forehead and one intersecting it from eyebrow to eyebrow. By means of a trephine a disk of bone is cut out in each of the upper angles formed by the crossing of the two lines and through these grubs sometimes may be extracted by means of forceps. Grubs often can be removed from the cavities made by the close cutting off of a sheep's horns.

A. S. A.

Atrophy of Udder.

I have a young Jersey heifer, milking 12 months, that shows shrinkage in right front quarter. Is there any remedy for this. She is a registered Jersey, about 30 months old, and I place a high valuation on her. S. J. C.

Virginia.

Patient massage of the affected quarter, applied twice daily, may improve matters, but the tuberculin test should be applied in all such cases, as tuberculosis is sometimes the cause of gradual painless enlargement or wasting (atrophy) of the udder. A. S. A.

Hoosier Extension CLOSED and OPEN

Fill Your Silo the Modern Way

Don't cover your silo with the old style roof and have it only three-fourths full after the ensilage has settled. Use instead a HOOSIER OPENING ROOF. A roof that you can open up and will add about six feet extension to your silo. After the ensilage has settled, close, and you will have a perfect roof. The kind of silo cover you have been looking for. It is not only right in theory, but guaranteed to be practical in results. Write for catalog and prices.

SHEET METAL SPECIALTY CO., Dept. G, GOSHEN, IND.

Strong Fans, a Tight Case and the Best Discharging Stack get the ensilage away from the knives. That principle in the

CLIMAX SILAGE CUTTER

insures quicker work on small power. Then there are the principles of the Inward Shear of thin oil-tempered knives; the heavy toothed feed roll, narrow throat, all illustrated and described in

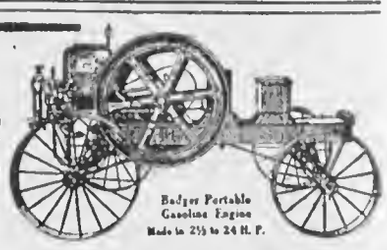
For Threshing and Ensilage Cutting

The "Badger" gasoline engine is the best power plant for the big jobs, like threshing and ensilage cutting. Reliability, plenty of power, steadiness and readiness, required for these big jobs, typify the "Badger." Made of the best materials; speed and parts made adjustable; the engine develops more speed than rated at less cost of fuel. Runs by gas, gasoline or kerosene. Consumes no fuel which is not turned into power.



Badger Portable Gasoline Engine Made in 2½ to 24 H. P.

Badger

The "Badger" is always ready to run—Winter or Summer—at an instant's notice. **Every part guaranteed for five years unconditionally.**

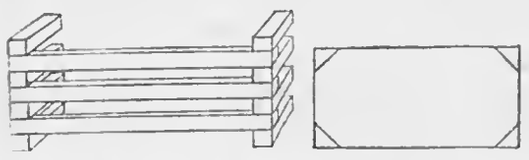
GASOLINE ENGINES

Cob-House Silo.

I HAVE in my barn directly adjacent to my cattle stable a hay mow which is not in use for hay, and which I would like to use for a silo. It is a corner so that two sides are the sides of the barn. I have a space 12x15 feet square and 25 feet high that I can utilize. I have seen coal bins or storage pockets built of two-inch stuff cob-house style, and it occurred to me that I could build a silo on the same plan, lining it with three-inch hard pine flooring which gives a very smooth, tight finish, and could make corners eight-square, see diagram. Can you advise me if this is practical, and if so, what size timber should I use, 2x4, 2x5 or 2x6? I expect the bottom would need be stronger than the top. I am not able to figure the pressure, and so do not know size of plank needed. M. O. B.
Massachusetts.

If timber is plenty and cheap you can build a cob-house silo very well by using 2x4, 2x5 and 2x6, halving on the corners, and using lots of 20-penny spikes and gas tar to make airtight walls. For the first third of the way up use the 2x6, the next third the 2x5, and the last of the way 2x4. I would have them sized and edged on one edge, the one that comes inside, and in laying see that they are made plumb so as to present a smooth and perpendicular face. Do some good carpenter work in halving the ends. In laying them up, get plenty of gas tar and put a liberal coat of it on the surface to



come between the layers, most in the center of the layer so in nailing not to come to the inside edge too much. Use a lot of it at the angles. If you can get some very fine hand saw sawdust thicken up the tar some with it to make body. Do not economize 20-penny nails. When the walls are up corner saw an 8x8-inch timber and spike them in the corners with a tar filler behind it.

As you go up, cut out a 20x20-inch manhole now and then, nail in jambs, make a door to fit in from inside. Paint the whole inside with the tar thinned with gasoline. Whitewash the outside with Portland cement. Put on any kind of roof you desire, anchor it so it will not blow over.

If you do not want it square, cut your stuff nine feet long and make it eight-square, and build the same, only you will not need to fill in the corners, only put in more of your cheap black paint. If you can build in your barn and can have the frame to back strengthen the walls you can use 2x4's all the way up, and will not need roof or outside paint.

JOHN GOULD.

Streaked Butter; Bees by the Pound.

WHAT can I do to get my butter uniform color? It tastes all right but it is all streaked with white. The cow is in pasture, the feed is all right. After it is churned I wash in three different waters, then salt it and work it in the salt. 2. An advertisement offers bees by the pound. Do you think this advertisement is all right? H. U.
Torrington, Conn.

1. Streaked butter is caused by insufficient or improper working, the salt not being thoroughly incorporated and the buttermilk removed. Butter need not be worked through three waters; churn the cream at a sufficiently low temperature to bring the butter in large granules rather than as a soft mass; stop the churning before these granules become united in a solid mass; drain off the buttermilk; add *cold* water to the butter in the churn and rinse by using the ladle in a dash churn or by giving a barrel churn a few turns; drain off the rinse water, remove the butter to a bowl and tilt the latter allowing the butter to drain for 20 minutes or so. After the free water has drained off, cover the butter in the bowl with the proper amount of salt, work it in lightly with the ladle and set the butter aside in a cool place for a few hours to allow the salt to dissolve and enter the butter. Then work the butter again, cutting and pressing it until the streaks caused by the buttermilk disappear. Tilt the bowl frequently to drain off the buttermilk as it works out. This should take but a few minutes; overworking the butter causes it to become salvy. Work the butter by cutting and pressure, never draw the ladle over the butter with a sliding motion, this breaks the grain. When packing the pressure of the ladle will also remove buttermilk and brine, drain this off. Avoid working butter more than necessary to incorporate the salt and remove the buttermilk and excess of brine.

2. Bees are bought and sold by the pound, it being necessary for the purchaser to have a hive fitted up with frames and foundation for their reception. Under favorable conditions a small number of bees with a good queen will soon increase into a good colony.

M. B. D.

Hygroma.

I HAVE a cow that has had one calf, and now has a soft bunch on her front knees. It does not seem to trouble her in getting up or down, but I do not like the looks of it. What could I do for it? Would it do to lance it? A. P.
Massachusetts.

A large cyst or sac contains serum and this has come from bruising upon the floor or manger. The usual treatment, among farmers, is to run a tape seton (rowel) down through the sac and move the tape up and down twice daily to cause the serum to flow out. A graduate veterinarian operates by opening the sac at its lowest part, evacuating the fluid, injecting tincture of iodine and then packing the cavity daily with antiseptic gauze or oakum saturated with an iodine solution.

A. S. A.

Jack Sores.

I HAVE a mule four years old which has some kind of an itch. He breaks out in little lumps and rubs all the time. The mule is in good shape and is working every day; seems to feel good every way but that. What is this, and what can be done for it? C. F. S.
Virginia.

See that the stall is kept clean and freshly bedded. Jack sores, and sores such as you describe as affecting your mule, are supposed to be due to germs in the dust of a badly cared-for stable. Do not feed corn or green grass. Feed whole oats, wheat bran and hay. Wash the affected parts once with a 1-50 solution of coal tar dip and afterward do not wash, as that tends to aggravate such sores. Twice daily apply a little of a mixture of one dram of iodoform and one ounce of oleate of mercury, well rubbed in. This ointment cannot safely be applied to large surfaces, but is fine for the sores on the legs. If the body is affected widely use an ointment of one part of iodoform and two parts of sulphur to the ounce of lard.

A. S. A.

Chorea.

MY five-year-old mare, a high-bred road horse, has a parrot mouth or over-shot jaw. She has what the veterinarian calls an involuntary twitch, jerking head to one side; she also shies, and is very excitable. The veterinarians wish to unnerve the head, but I doubt the success of the operation. What do you advise? W. H. S.
New York.

Nothing can be done for the over-shot jaw, and if you mean that "chorea" (St. Vitus' dance) is present, that also is incurable. We take "involuntary twitch" to mean chorea. If the graduate veterinarians consider that there is a fair chance of success from an unnerving operation that should be done; but without seeing the horse, we should suspect that the chances of perfect recovery are poor. A personal examination might change our opinion and under the circumstances you will have to abide by the judgment and experience of the local experts. A. S. A.

Foot Lameness; Cowpox; Ringworm.

WE have a cow which has a soreness in the hind feet. The trouble starts with a crack just over each quarter. The crack widens into a raw sore which suppurates and which we are unable to heal. The hoof at each quarter seems to crack away from the foot. Ground limestone is scattered over the floor after cleaning the stables. This was used all through the Winter. Cows run in pasture of which part is swampy. 2. Another cow has very sore teats. The trouble seems to start with a puffy swollen place which is extremely painful when the cow is milked. The swollen places gradually decrease in size and a crust forms. Generally when the crusts drop off the sore has healed but in some cases a little matter is seen. The sores are, in the crust stage, about the size of a pea and are thickly sprinkled over the teats, but do not extend to the bag. 3. A heifer, two years old, coming three, has some sort of a scaly affection on her neck. At the top the hair is nearly all off. The scaly part seems to follow the wrinkles along the top of her neck, but along the sides and extending up to her head are round patches the size of a 10-cent piece. She is running in a pasture with other young stock and steers, and none of the others are affected. A. C. C.
New Hampshire.

1. Scratches or abrasures of the skin become infected in the mud or filth through which the cattle travel. Do away with the cause. Cleanse affected parts and then bathe with a hot, saturated solution of sulphate of copper. Do not repeat this treatment. Cover the sores with oakum or cotton saturated in a 10 per cent. solution of coal tar disinfectant and renew the dressing once daily. If any sore is obstinate in healing swab it with tincture of iodine each other day, as well as using the wet dressing. 2. The cow has "cowpox." Isolate her and have her milked by one who does not go near the other cows. Twice daily wash her udder with a solution of one ounce of granular hyposulphite of soda and one quart of soft water. Apply glycerite of tannin to the sores as often as found necessary. 3. Ringworm is present. Scrub the spots clean and then rub in iodine ointment every other day.

A. S. A.

Warts.

How can I remove a large wart from my colt, on breast? The wart is three inches across and 1½ inch at base.

H. H.

Tie a fine cord very tightly around the base of the wart and then saturate the wart once daily with glacial acetic acid, applied drop by drop. The better way of treating such a wart would be to have it removed by operation. A. S. A.

SAL-VET
TRADE MARK
REG. U.S. PAT. OFF.

Will Be Exhibited at The NEW YORK STATE FAIR Syracuse, Aug. 31 to Sept. 5

If you go to the State Fair, be sure to visit the interesting SAL-VET exhibit. In no way can you spend a few minutes more profitably. Our representatives will be glad to explain how the blood-sucking stomach and intestinal worms cause 90% of all live stock losses—how they steal the food your animals eat, drink their blood, sap their vitality, breed disease, and keep all stock from thriving as they should. You can also see the prize-winning exhibits of some of the most successful breeders in America like Mr. Henry L. Wardwell, Mr. J. C. Duncan, Jas. Leet, and others, who will tell you it pays to feed SAL-VET—the great worm destroyer and live stock conditioner. SAL-VET is a medicated salt—easy to feed—you can let all your farm animals run to it and (201)

THEY WILL DOCTOR THEMSELVES

It requires no dosing, no drenching, no starving. The cost is trifling—only 1-12 of a cent a day for each sheep or hog and only slightly more for larger animals. Every pound pays big profits to the feeder in better, healthier stock and faster gains.

Mr. Wallace W. Case, Rock Hill, N. Y., says: "Have used 'Sal-Vet' on two of my horses and notice a marked improvement in their condition."

Jos. E. Fischler, Wellsboro, Pa., writes: "Have not had a sick hog or sheep on my place since I commenced feeding 'Sal-Vet.'"

Walter H. Penfield, Randolph, N. Y., says: "Since feeding 'Sal-Vet' we have discovered that our stock were very wormy. We are greatly pleased with results."

Mr. Henry L. Wardwell, Ex-Pres. of the Amer. Shrop. Reg. Assn., says: "We have great faith in 'Sal-Vet' as a preventive of worms in our sheep. We keep it before them all the time."

Whether you go to the fair or not, I want you to have an opportunity to try SAL-VET at my risk. I'll rid your stock of worms or no pay. I'll feed all your stock 60 days without asking a single penny of pay in advance. Just fill out the coupon below.

PRICES:

40 lbs., $2.25; 100 lbs., $5; 200 lbs., $9; 300 lbs., $12; 500 lbs., $21.12. No orders filled for less than 40 lbs. on this 60-day trial offer. Never sold in bulk; only in Trade-Marked Sal-Vet packages. Shipment for 60 days' trial are based on 1 lb. of Sal-Vet for each sheep or hog, and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular size packages.

MY GREAT 60-DAY TEST OFFER

OPEN TO ALL :: SEND NO MONEY

Just fill out the coupon—tell me how many head of stock you have and I'll ship you enough SAL-VET to last all your stock 60 days. You simply pay the freight charges when it arrives and when the 60 days are up report results. If the SAL-VET I send you don't do what I claim, I'll cancel the charge—you won't owe me a single penny. Send the coupon now. Address:

Drooping Chicks.

I HAVE a flock of about 300 White Leghorn chicks; they were hatched about June 1 and grew well until about a week ago, when some of them would drop their wings and sit around with their eyes closed and in a day or two die. I feed them the Cornell ration and they are free from lice. What is the trouble?
Roscoe, N. Y. L. S.

There is nothing that can be done for these chicks in the way of curative treatment; the least vigorous of them will die from the effects of the intestinal infection while the more vigorous will survive, some of the latter to the detriment of the mature flock and subsequent broods of chicks. Sour milk, fed early and continuously, seems to have a very definite beneficial influence in preventing intestinal infection and promoting growth and vigor; this, in connection with care to hatch only from vigorous fowls whose progeny has not shown marked tendency to diarrhœal infections, and clean, sanitary, surroundings with proper feeding and general care comprises about all that can be done to guard against serious losses from this source. Chicks that are evidently affected, and yet which survive, should not be allowed to enter breeding pens next year; they are apt to transmit their weakened vitality if nothing more and may perpetuate the trouble. True white diarrhœa is directly transmitted by hens whose ovaries contain the germs of this disease and while your chicks may not have this particular form of infection, the others are so closely related to it as to require much the same treatment.
M. B. D.

Tom Barron and "Practical" White Wyandottes

THE controversy over the great-laying White Wyandottes which Mr. Barron has in the international egg-laying contest, at Storrs, Conn., is very amusing to those who have long noted (and disapproved), the purely artificial qualifications called for by the American Standard in "show" birds, and the claim made by some extremists that Barron's birds are not purebred White Wyandottes, with his straightforward and manly defence of them, will help to clear the air. It certainly is true that Mr. Barron's White Wyandottes at Storrs are not "standard" White Wyandottes, are not the "dumplings" which you describe the show Wyandottes as being; but that they are purebred White Wyandottes, and bred from straight American stock birds, every one who met Mr. Barron at the Storrs meeting, and heard his plain statement of how he became interested in White Wyandottes, and how he selects and breeds them for great egg production, will readily believe.

Mr. Barron's first White Wyandotte hen was given to him by a friend but she was so ragged from the molt and so dirty he took a dislike to her, and asked another friend to take her off his hands. This friend put the ragged, dirty hen in with a pen of Minorca pullets, and a few days later asked Mr. Barron: "Do Minorcas lay tinted eggs, Tom?" Mr. Barron told him: "No. Minorcas lay white eggs, but those pullets of yours are not laying yet, anyway." A little while later the friend was at him again: "That dirty white hen you gave me laid us six eggs last week!" And then Tom went over and shamefacedly asked the friend: "Will you kindly let me have that white hen back again?" He had begun to "sit up and take notice!"

Tracing up the history of this dirty, ragged-looking hen he found that she was a straight American-bred bird, of Arthur Duston's stock; Barron bought 10 other White Wyandotte hens, of another American strain, and bought a male bird of still another American strain. "And," said Mr. Barron, "there has never been one drop of blood of any other strain or stock introduced into my strain of White Wyandottes."

The lengthening of the body of Tom Barron's birds is entirely due to his breeding them for egg production only; he breeds from his best layers, mated to sons of his greatest layers, with never a thought of the artificial requirements of the American Standard, and, furthermore, this lengthening of the body of White Wyandottes by trap-nest testing for great egg production is nothing new. That is the most amusing part of the matter.

Other White Wyandotte breeders who breed for egg production only have done the same thing, as witness the birds of Mr. Richardson, of Massachusetts, told about on page 709 of the *Reliable Poultry Journal* for August. And the undersigned noted the same result in the trap-nest tested White Wyandottes bred by Mr. Candee, of New York, and told of the lengthened bodies of Candee's birds in an article written for the *American Poultry Advocate* about eight years ago. All of this discussion of Tom Barron's White Wyandottes is a good thing for the "practical" side of the poultry business—for those poultrymen who are working for greater egg production. It will help to clear the air!

"Let the heathen (standard makers) rage, and imagine vain things!" They are simply beating the air! Utility poultry is steadily gaining ground; it is surely coming into its own. A. F. HUNTER.

Ailing Chicks.

ON June 1 I hatched 56 chicks with hens, since then have lost 10 with the following symptoms: They seem to be taken suddenly with drowsiness, sit around for a day or two with eyes shut, and die. They were fed on chick feed for the first two weeks, then changed to commercial scratch feed and dry mash and sour milk, with all the green food they will eat, such as lettuce, Swiss chard and clippings; are confined to a yard 26x40, coops strictly clean and not a louse in sight. G. R. F.
New York.

These chicks have succumbed to some infection, very likely of a diarrhœal nature, to which they have been exposed, and which they did not have vitality enough to resist. Late hatched chicks seem less able to resist infectious diseases than those hatched earlier and from hens whose vigor has not been depleted by long continued laying. Of these diseases, white diarrhœa is the most prevalent and serious but other infections abound and take their toll yearly from the flocks of young chicks. There is no cure after the trouble has developed; losses from this source should be prevented by hatching only from vigorous stock and giving proper care to the young chicks. Early and continuous feeding of soured skim milk does much to prevent the inroads of various infections and contributes to the growth and vigor of young stock. True "bacillary white diarrhœa" is transmitted from parent hens through the eggs and any flock whose chicks show marked tendency to this disease should be discarded as breeders. M. B. D.

Shall We "Swat the Rooster?"

WHAT is your opinion of this "Swat the rooster" crusade now being given so much publicity by the poultry press and the Federal Government? Personally I am convinced it will, if not moderated, mean the end of farm poultry and the building of a race of degenerate fowls. Only today I read of 250,000 roosters being killed in one day in one State. How many of the owners kept a year-old male for a breeder next Spring? Mighty few, I bet. Of the 250,000 fully 75 per cent. were breeders, as the buyers are not going to pay market prices for senile wrecks. It all sums up to me the fact of pullet and cockerel matings next Spring and the resulting poor fertility, dead-in-the-shell chicks and weaklings. It will be a heyday for that old nightmare "white diarrhœa."

Much better if we would plan a swat one and save the other policy. It will pay any farmer to keep a year-old male for breeding, even if he has to place him in a separate yard and spend a few minutes each day attending his wants. My plan is a suggestion to keep a mated breeding pen all the year around. I find after careful experiment a male kept from his mates for a period of two or three months is not as active as when left with them. When yarded by himself a male will take on flesh or else worry himself into a state of physical debility, unless he is carefully attended, and few farmers are going to give him the care a fancier or real poultry breeder would. Separation is against the laws of nature. A male takes a rest during the molting period and then nature repairs his vitality. If you will notice at the molt a male seldoms mates, and fertility during this period is always bad, at least that has been my observation over a period of four years. Fads and fancies go at times, but I think all breeders should be warned against some of the ideas of theorists. Fertile eggs must be had to reproduce the race, and while infertile eggs can be had only by separation of sex, yet the farmer should be taught the value of a breeding pen and educated to care for it. I am against a wholesale swatting of the rooster, and hope to have the support of other breeders. ALLEN JENKINS.
Virginia.

R. N.-Y.—We do not believe this compaign for killing off the surplus rooster will cause any such trouble as Mr. Jenkins fears. Anyone who would be interested enough to "swat" would be intelligent enough to use improved males in his flock. We think this "swatting" will develop a better business for the breeder of improved stock. Only a very small proportion of the useless roosters will be killed, and we think their loss will be a gain to the poultry industry. The fact is some of the scientists now find that sterile eggs are as subject to some forms of "rot" as are the fertile eggs. What Mr. Jenkins says about the breeding pen is all right, but killing off the drones would not interfere with that.

Trap Nest; Broody Hens; Sour Milk.

IT seems to me there should be some rule-of-thumb method whereby the busy farmer-poultryman could pick his best laying hens for breeders. My idea is that there ought to be some characteristic traits and habits of good layers, although it seems to be disproved that there is any uniform physical type. I wish you would submit the following points to some of the observant trap-nest operators, for comparison with their findings according to the records. If anything definite along these lines can be determined, it would be valuable to many of us. I believe that a hen having these traits should be an extra good layer, or at least extra profitable.

(1) A hen that lays during Fall and early Winter. (2) A late molter. (3) One that lays during molt. (4) One that is active and always next to the feed pail. Good eater. (5) Not much given to broodiness. (6) One late to roost.

Likewise, that these traits indicate a poor one:

(1) A poor eater. (2) One lazy or sluggish. (3) A wild one. One that scoots around the farthest corner when you appear. (4) One frequently broody. (5) One not laying in Fall or early Winter. (6) One going early to roost and not coming at the feed call. All these points with due allowance for the breed and condition at different seasons.

Here is the very best method of breaking up broody hens. Put in a strange pen, without nests, with a lively young cockerel to keep them stirred up (the kind that digs you in the leg when you pick up a hen, if you have such a one.) Feed plenty, and make them work for it, and water. Starvation is most illogical. You want the hen to make eggs; then give her the "makin's." She is fortified to starve by the week if necessary, anyhow. If a week of this doesn't change her conduct, then ax her to lay; she's not worth keeping.

I must protest against this comparing of the sour milk pen in the contest at Storr's with the other pens. To anyone who has fed sour milk to poultry, and knows how the egg record bounds up (and also how it slumps when discontinued) it is most absurd. Why, the poorest pen in the lot would have laid at least 100 more eggs by now, if they had all the sour milk they wanted. Compare them with their own four check pens, from 260 to 396 eggs behind them, and you will see what a handicap the rest of the pens work under. Where might any of the 10 pens that have passed 1,200 now be if they had the sour milk? There is no basis of comparison without a handicap.
New York. LEO A. MAPES.

EARLY MOULTING.—We read with interest, last Fall and Winter, the many reports of pullets moulting as we had 150 White Leghorns, hatched principally in May, drag through a four month moult. These pullets are again moulting—the building is full of feathers. Would you feed heavy of bran, bone meal, etc., or keep them on their regular laying ration? They are on free range with running water. Maine formula of dry mash always before them with wheat, oats and corn twice daily. F. B. N.
Ohio.

"My new dog ignores me." "If you had a pedigree as long as his you'd be exclusive, too."—Louisville Courier-Journal.

Make Your Own Concrete
Save $5 to $10 Per Day

Champion Power Batch Mixer
is a big money maker on the farm, for laying barn floors and curbs, walks, fence posts, silo blocks, etc. Will mix more than one-third cubic yard at a batch. Can be used as feed mixer when desired. Strongly built; repair proof, will do steady, hard work for years.
Price Only $35 Guaranteed to satisfy you or money refunded. Special price when mounted on truck with engine attached. We make also a hand mixer of same pattern at lower price.
Shipment from warehouse stock:

THE EGG-LAYING CONTEST.

TO the surprise of everybody the forty-first week shows a gain of 145 eggs over the previous week. Of this gain the White Leghorns contributed but nine eggs; the other breeds being responsible for nearly all of it. This shows that broodiness is subsiding and the birds are getting down to business again. The Leghorns, however, continue to make all the high records, as they have for many weeks. Bonnie Brook Farm's pen take first place for the week, with a score of 61. Five birds in this pen laid every day in the week. Three pens tied for second place with scores of 55 each. They are the "sour milk" pen from Storrs Agricultural Station, Marwood Poultry Farm's pen, and Francis F. Lincoln's pen. Tom Barron's Leghorns laid 53; this pen is now third in the competitive pens. Pen number 42—the sour milk pen—from Storrs, has the highest total score, viz., 1,744; but they are not competing. Tom Barron's White Wyandottes still lead the competing pens, but they are only one egg ahead of Francis F. Lincoln's pen of White Leghorns, and in all probability Lincoln's birds will be the leaders by next week. In my opinion the American birds will win the contest at Storrs this year, though Tom Barron's birds are putting up a bully fight and they will probably win at Thorndale and at Mountain Grove, Mo. GEO. A. COSGROVE.

Molting and Breeding Ration.

WHAT is the best ration to feed hens during the molting season? What ration should I feed breeders through this Fall and Winter? T. W. K.
Cavendish, Vt.

No special formulas are needed for feeding fowls through the molting season, but the rations should not consist of fattening foods, such as corn and buckwheat, exclusively. While growing new feathers the protein element of food is needed as much as while producing eggs, and this should be furnished in the form of meat meal or scrap, skim-milk and the grains of good protein content. The wheat products, oats, gluten feed, oil meal, Alfalfa and clover are all good. In short, feed the fowls as well as though they were laying. Neither are any special formulas necessary for breeders, but if they can be induced to eat them, either whole or ground, oats may well form a considerable proportion of their grain food. They should have ample range and not be forced for laying through the Fall and early Winter; to this end but little meat should be given. M. B. D.

Prolapse of Oviduct.

I CARRIED a flock of 12 Leghorn pullets and 23 Reds through the Winter. In December, January and February they laid an average of about six eggs a day. In February, finding it difficult to get meat scrap delivered to the house, I changed over to cottonseed meal, using three parts of this for two of meat scrap, and cutting down one part on the cracked corn. After feeding for two months with the new ration I had a case of prolapsus of the oviduct, from which a Red died. The hens were laying about 20 eggs a day then. I was advised by a poultry expert to cut down on the protein, as the prolapsus was due to too heavy laying. At the same time 13 of the hens began to stand around in a corner, close their eyes, and slowly sink their heads. I gave them castor oil and a tonic, and it seemed to cure all but one, which kept it up until it died. The poultry expert thought that the sleepiness might be due to an excess of carbohydrate in the food. I discontinued the cottonseed meal in the beginning of June and substituted meat scrap, after I had lost six hens through prolapsus or hemorrhage of the oviduct. Now, after a month of absence of prolapsus, I have two cases again. My hens get cracked corn and wheat, half and half, and a dry mash of bran, gluten, and beef scrap. They have all the grit and green food they want, have a fairly large yard, an open front dry house, and fresh water twice a day. How can I prevent prolapsus? A. G.
New Jersey.

As prolapse of the oviduct is consequent upon inflammation, due probably to overstimulation of the egg-producing organs, the obvious remedy is to feed a less forcing ration and be content with fewer eggs and healthier fowls. Cottonseed meal has never had an enviable reputation as a poultry food and its use may have had something to do with the condition of your flock. Moderately favorable reports from its use as a source of protein in poultry rations have been received from some of the experiment stations, but in the present state of our knowledge concerning it, it is probably best to use it sparingly. It may well be that some high-bred fowls are more subject to inflammation of the egg producing organs than their more rugged and less productive sisters, and this tendency to inflammation and prolapse may perhaps be inherited. M. B. D.

Poor Feathering.

I HAVE chicks that are almost big enough to kill but almost unde, except the soft down such as all chicks have when hatched, except two or three wing feathers, and they turn right up over the back, similar to a fantailed pigeon. It is mostly the cockerels that are that way, the pullets seem to feather up better. They all run together and have free range of an 80-acre farm. What is the cause, what the cure, if any? I have noticed the same before this season but not to the extent that it is this season. I notice too that some of the old birds have what seems to be an imperfect wing, or wings, by spreading the wing feathers there seems to be a few wing feathers lacking right in middle of wing; have noticed same on other people's chickens. A. C. G.
Pennsylvania.

It is not uncommon to see chicks which fail to develop their plumage with the growth of the body and remain bare until pretty well grown. I do not know that the cause of this has been, or can be, explained; it is doubtless due to some nutritional disturbance and does not often affect a sufficient number of chicks in a flock to make it a matter of any great concern. The only remedy that I can suggest is plenty of food and time enough for the belated feathers to make their appearance. M. B. D.

Chicks Fail to Grow.

WHY do chicks stay about the same size and are all naked? They do not grow at all. A. P.
Orange Co., N. Y.

An occasional chick in a flock will fail to develop with its mates and even fail to develop feathers as it should from some lack of vitality which it would be hard to explain. If a whole flock fails in ordinary development there is reason to think that it is not being sufficiently fed or that lack of vigor in the parent birds is responsible for such a poor start in life that its effects are slowly, if ever, overcome. This, of course, if there is no evident disease that is stunting the chicks. Chicks that show marked slowness in developing should be discarded at once or so marked that there will be no danger of their ever being used for breeders. M. B. D.

Peas for Poultry.

ARE peas a good food for poultry when mixed with grains, such as cracked corn, wheat and oats? These are dried peas which have become worm-eaten and we can purchase them at less than $1 per 100 pounds. In what proportion would you mix these grains to feed morning and night to hens that have dry mash before them at all times? K. M. K.
Demarest, N. J.

Cracked or crushed peas are used to a considerable extent in commercial chick feeds, and I know of no reason why whole peas should not be equally good for fowls, provided that they will eat them; on this point I should assume myself by actual trial before purchasing any considerable quantity. Peas have a nutritive ratio of about that of wheat bran; if relished by the fowls they might probably be fed to advantage in the proportion of one-sixth to one-fourth part of the entire whole grain ration. So far as I know whole peas are not commonly used as poultry food, and it would be advisable to ascertain their acceptability to the fowls by actual test before investing much in them. M. B. D.

Drooping Chicks.

WE have some incubator chicks about four weeks old that are dying at the rate of five and more per day. They go around with their wings drooping and act as though nearly asleep until they drop down and die slowly. They eat until nearly the last. No signs whatever of bowel trouble. I feed them on broken rice and just a little dry middlings occasionally. Plenty of fresh water.
New York. J.

Broken rice with an occasional feed of wheat middlings is not a suitable diet for young chicks, as it does not furnish the needed elements for growth and development. Corn, oats, and wheat as well as ground grains in the form of mash and some animal product such as skim-milk or meat scrap are all needed. Chicks of little vitality, such as late-hatched chicks are apt to have, often succumb at three or four weeks of age to infections which stronger chicks resist. Some of these infections are accompanied by diarrhœa and some are not. Prevention rather than cure must be depended upon to avoid these losses, and prevention can only come by hatching from vigorous stock that has not lost vitality from prolonged laying, cleanliness in the care of the chicks with disinfection of utensils and quarters when needed, avoidance of contact with other diseased chicks or the quarters in which they are housed, and healthful surroundings in which they are reared. Correct methods of hatching and brooding have also a great deal to do with the stock of resistance to infections diseases with which chicks start out in life. The early and continuous feeding of soured milk appears to exert a very favorable influence both in preventing intestinal infections and promoting growth and vigor. M. B. D.

"TELL me, old man," said the perennial seeker after knowledge, "why is your hair gray and your beard brown?" "Easy!" answered the facetious a. m. "My hair is twenty years older than my beard."—Credit Lost.

Publisher's Desk

I AM enclosing you one dollar for a year's subscription to your magazine. The 10 weeks I have received it has proved it to be a very satisfying weekly visitor. While all of its departments are good the caleium from the "Publisher's Desk" is particularly pleasing to me, as the times demand that some paper should have a good straight stiff backbone instead of the usual one shaped like the $ mark and of the consistency of fresh putty, as is all to common. E. A. P.
New Hampshire.

We are particularly proud of the renewals from these 10 weeks' subscriptions. Farm paper publishers for the most part have abandoned them on the ground that they do not pay. It is true that there is an actual money loss on every 10 weeks subscription. The clerical work alone is as much as on a yearly subscription, and actually exceeds the 10 cents. The only way to make 10 weeks subscriptions profitable is to give a service that farmers do not find in other papers, so that they renew for a year and become regular patrons of the paper afterwards. This and similar correspondence coming to us in every mail shows that the farmer realizes the situation and appreciates a real service in his interest. The prompt renewal of annual as well as 10 weeks subscriptions speaks with even more convincing evidence than the special letters like the above. Some years back, when we formulated this service into a department of the paper, it was criticised and ridiculed. Even yet we occasionally see a scoff and a sneer from the advertisers who are not permitted to use our columns, and from publishers who are obliged to defend them. Of late there have been a few feeble attempts at imitation, but these serve only to emphasize the dollar mark backbone referred to above. An occasional show of a petty weakling or the boisterous criticism of an already discredited concern will not constitute a service of any great benefit to the public. It is easy enough to turn down a $2 advertisement, but few publishers can refuse a $2,000 order with equal indifference, and until he gets so that he can do so, the dollar sign will be his mark of perfidy. No man can serve two masters. The publisher who knowingly takes advertising money from a dishonest or deceitful advertiser cannot render a faithful service to his subscriber. None of us can hope to be perfect, but the reader will excuse the errors if they know the purpose is right. The publisher is, however, under constant and intelligent review. Thirty years ago bluster and bray and pretense went a long way. They do not go far now. Today the farmer can read between the lines, and he knows the difference between service and palaver.

I would be willing to join Dr. Ulman's Anti-Fake Association if you will kindly send my name to that department. I certainly am willing to do my part in scaring out the fraudulent advertisers.
Pennsylvania. A. C.

The Anti-Fake Club is growing nicely. Every name that comes in now will be charter members. The permanent organization will be formed in the Fall; and every person who is willing to report deceptive advertising and to protest to publishers against them, and if the publishers persist, to refuse to accept the paper, will be eligible for membership.

Enclosed find pamphlet of the Electro-Chemical Ring Co., Toledo, O., that was handed to me by a business man of a nearby town. After looking at a page or two I concluded it was another "fake." I would like to know your views of the subject, expressed through the columns of THE R. N.-Y. C. H. A.
Ohio.

The booklet enclosed proposes to cure anything from cancer, paralysis or rheumatism to loss of hair by the use of this electro chemical ring, which seems to rival the magic wand of fairy tales. This is too palpable a fake to require further comment.

About the middle of September, 1913, an agent of the Syracuse Portrait Co., Syracuse, called at my home and my daughter gave him a cabinet picture to be enlarged. She also signed a contract with them which stated that the portrait would be delivered about October 15. We did not receive it, so wrote to the company Nov. 1, and received a letter stating that it would be delivered November 16: have written to them since and asked them to send me the cabinet picture or the enlarged portrait but have had no reply. The picture was very valuable to me. Can you help me? G. S. B.
Massachusetts.

The above is the usual experience of those giving orders to agents of the so-called portrait houses. They are as much to be avoided as the smooth-tongued tree agent. We have written several letters to the Syracuse Portrait Co. in behalf of the subscriber, but have been entirely ignored. Farmers will do well to show agents of this kind the door as soon as they begin to talk and if the agent delays taking his departure call the dog.

April 8th, 1914, I shipped to E. G. Fisher, Oakwood Heights, Staten Island, N. Y., two baskets containing 36 I. R. duck eggs for which Mr. Fisher paid me $3. April 12 Mr. Fiisher wrote me the card herewith enclosed to the effect that he has received but one basket. In reply to his card I shipped him on April 16th another basket containing 18 duck eggs instead of the one supposed to be lost, and entered claim against the Express Co. for the same. The Express Co. show that both baskets of the first shipment were delivered on the 10th and 11th of April. See papers herewith enclosed. I have requested Mr. Fisher to pay for the extra basket of eggs but can get no satisfaction from him. Will you kindly take the matter up with Mr. Fisher and see what you can do for me?
Pennsylvania. H. J. V. D.

The express company's receipts accompanying leaves little doubt that all the shipments of eggs were delivered, but Mr. Fisher ignores our appeals to his sense of fairness and honesty in H. J. V. D.'s behalf. This is another poultry case where the seller gets the short end of the deal.

I am greatly obliged to you for your endeavor in my behalf. Truly your paper is a public benefactor, and deserves every recognition. I had given up hope and am the more grateful. A. O.
Massachusetts.

This refers to the collection of $6.40 from Adams Express Company for egg breakage in three shipments. Claim was declined to shipper and at first to us, but was just and clear proof of the loss, and we were in position to insist on settlement.

We received our eggs to-day (July 3) ordered from R. J. Gibbons, Mt. Holly, N. J., June 5. Some look like duck eggs, some bantam, some R. I. Reds and others had the appearance of having been in a nest for a week. What do you think of that for "Young's strain S. C. W. Leghorns" advertised by Mr. Gibbons?
Maryland. W. H. W.

I sent $4 to R. J. Gibbons, of Mt. Holly, N. J., for 100 Young's strain S. C. W. Leghorn eggs, advertised in your issue of May 30. Did not receive the eggs for about three weeks. Some of the eggs were quite highly colored, something I have never seen in Leghorn eggs. Mr. Gibbons, in his advertisement, agreed to deliver the eggs, but I had to pay 66 cents express. He also advertised free valuable instructions for feeding, forcing and getting eggs, but I failed to receive any such. I wrote Mr. Gibbons in regard to this shipment, and I am enclosing the card I received in reply. Under the circumstances I do not feel at all sure whether I have Young's strain of Leghorns or simply eggs. E. J. C.
Connecticut.

On July 28 E. J. C. reported as follows:

Those eggs purchased from Mr. Gibbons have hatched, and they are an interesting looking lot of mongrels. Very few of them are clear white, some almost entirely black, some with black dots, some resemble Black Orpingtons and some R. I. Reds.

In the case of W. H. W. the eggs were returned and Mr. Gibbons refunded one-half the purchase price. He also refunded $2 of the purchase price to E. J. C., and makes the excuse that being short of eggs he "let the order out." We have report from Mr. Gibbons' neighborhood that his flock of hens consists of various breeds all running together, so that the eggs received by the complainants are just what might be expected from their own hens. The record Mr. Gibbons has made in the above cases puts him in the class with E. E. Cooley, of Ransomville, N. Y., and E. F. McAvoy, Cambridge, N. Y. Whether due to deliberate and wilful misrepresentation and fraud, or merely Mr. Gibbons' carelessness and indifference, the annoyance and loss to the complainants in question is such that we do not hesitate to advise our people to avoid Mr. Gibbons in the future.

The Jeffrey Lime-Pulver

Grinds Limestone on the Farm 2 to 3 Tons Per Hour

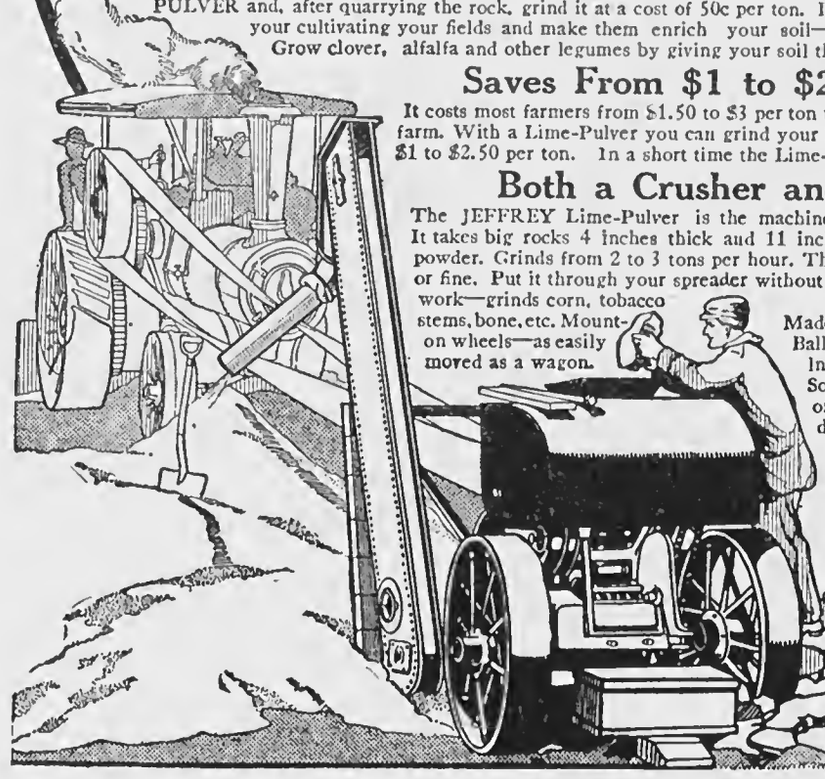
The day of cheaper lime is here. If you have lime rock available you can make fertile fields of land that is now sick and sour. No need to buy burnt lime at high prices that burns up the humus and wastes the Nitrogen in the soil. No need to buy ground limestone and pay for freight and hauling. Get a JEFFREY LIME-PULVER and, after quarrying the rock, grind it at a cost of 50c per ton. Dig out those rocks that prevent your cultivating your fields and make them enrich your soil—turn the stones into dollars! Grow clover, alfalfa and other legumes by giving your soil the lime it needs.

Saves From $1 to $2.50 Per Ton

It costs most farmers from $1.50 to $3 per ton to get ground limestone on their farm. With a Lime-Pulver you can grind your limestone for 50c and save from $1 to $2.50 per ton. In a short time the Lime-Pulver pays for itself.

Both a Crusher and Pulverizer

The JEFFREY Lime-Pulver is the machine that crushes and pulverizes. It takes big rocks 4 inches thick and 11 inches long and reduces them to powder. Grinds from 2 to 3 tons per hour. The product can be ground coarse or fine. Put it through your spreader without trouble. Crushes rock for road work—grinds corn, tobacco stems, bone, etc. Mounted on wheels—as easily moved as a wagon.



Made in the famous Jeffrey shops. Ball-bearing pulverizer—Pulverizing hammers of manganese steel. Sold on a guarantee of satisfaction or your money back. Write today for valuable booklet, price and let us analyze the lime-rock on your farm for you without cost.

FARMERS' FAVORITE ENGINE

Is all that the name implies. It is built for service. Light in weight. Easy to move from one part of farm to another. Built by skillful workmen and of best material. Perfect Hopper Cooling System. Built in sizes 6 to 10 horsepower. Other sizes and styles. Equipped with magneto. Can be mounted on wagon. Lack of vibration is a notable feature of this engine. 20 YEARS of experience in building satisfactory engines for farmers is behind every FARMERS' FAVORITE. We have never had a dissatisfied customer in this time—a record to be proud of. If you need power for any kind of farm work, it will pay you to investigate the merits and economy of FARMERS' FAVORITE ENGINE. Write us for further information and prices TODAY.

See EXCELSIOR ENGINES AT NEW YORK STATE FAIR

FARMERS: You will find it worth while to see the EXCELSIOR engine at Syracuse, at the State Fair. You will have a chance to see that the EXCELSIOR is the engine you need on your farm; you will have a chance to compare it with hundreds of other engines. Do not take our word for it that the EXCELSIOR is the best engine made. Go to Syracuse and BE SURE OF IT. If, however, you cannot go to the Fair, order an EXCELSIOR with the understanding that it has got to be the best working engine you ever saw or used, that you have got to be satisfied that it is the best bargain on the market, or you send it back; and you do not have to pay a cent in advance. Try the engine first. Pay if you find it everything we say—the best engine you can buy. Tell us the size engine you want and when you want it and get a SPECIAL OFFER, but if you possibly can, SEE THE EXCELSIOR AT THE STATE FAIR, and when you see it side by side with all the other engines, you will agree with us, that the EXCELSIOR IS THE ENGINE YOU NEED ON YOUR FARM.

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending Aug. 21, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914.	1913.
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.10 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.61 and $1.51 for B and C. Hotels and restaurants using two to three cans per day are paying five to 5¼ cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

Best creamery has advanced one-half cent. Other grades are unchanged and market rather weak. There is considerable surplus of undergrade butter which is hard to dispose of. Restaurants which formerly used butter greasy in texture or ill flavored have found that good butter is a profitable means of advertising their places. Many moderate priced restaurants now buy the best grades of creamery.

Creamery, extra, lb	30½@ 31
Good to Choice	25 @ 29
Lower Grades	20 @ 22
State Dairy, best	28 @ 29½
Common to Good	18 @ 25
Factory	19 @ 22
Packing Stock	18 @ 21

Elgin, Ill., butter market 30 cents.
Philadelphia, western creamery, 31 cents.

CHEESE.

Prices have advanced one-half cent, and many holders not ready to sell at this figure. The retail demand has dropped considerably and will slacken still more at further advances. The retailer who pays 16½ cents, charges his customers upwards of 20 cents, the difference being not all profit. There is some shrinkage and he must give up weight with every pound or half pound sale, besides cutting a good many sample slices.

Whole Milk, fresh, specials	16½@ 16¾

EGGS.

Another one cent advance has been made in nearby white eggs. The market is burdened with mixed and lower grades, and because of the irregular quality of current receipts, there is considerable demand for storage stock. Some further shipments to Europe are noted this week—about 20,000 dozen.

White, choice to fancy, large	34 @ 35

Lower grades	19 @ 24

FRESH FRUITS.

There is a good demand for choice apples of standard Fall varieties, like Alexander, Yellow Transparent and Duchess, the best selling up to $3 per barrel. The market is still loaded down with windfalls and culls. A few carloads are going to Europe this week. Usually they take a considerable quantity of our best Fall varieties from the Hudson River section. Peaches continue low, except for the best. Now and then a lot is found good enough to go above $2 per crate, but $1.50 is nearer an average of sales, and a great many have wholesaled for $1. Basket stock runs from 25 to 75 cents for 16 quarts. Small sizes are in surplus, the result of overloaded trees or drought. The pear market is weak, especially on nearby Bartlett, which are small and lacking in color compared with the heavy receipts of this variety from the West. The earlier varieties of grapes, Champion and Moore's Early are on hand from nearby points, but selling slowly because of the abundance of peaches.

Apples—Alexander, bbl	1 50 @ 3 00
Yellow Transparent	1 50 @ 3 00
Duchess	1 50 @ 2 50

The pastures in this section are very poor, and likely to continue so, as there has been very little rain in the past six weeks. Milk prices abut the same as in former years. Every farmer keeps from three to 12 cows, grade Holstein as a rule. There is no particular effect made to improve the herd by keeping a pure-bred sire. In past years calves three days old could be bought for from $1 to $2 per head. This season the price is $5, and scarce at that. More calves are being raised as cows sell from $50 to $80 per head.

Subscribers' Exchange

WANTED—To buy or rent small farm within 50 miles from New York City. HERBERT HOOS, West Second, Peru, Ind.

FOR SALE—235 acres, good soil and buildings, fruit and stock farm in fine condition, $35 acre. Inquire T. S. PAGE, Cohocton, N. Y., R3.

FOR RENT—Well equipped poultry and general farm, for term of years; nearby retail market with good will. Box 6, Barnstable, Mass.

GENERAL PURPOSE or dairy farm of 80 acres with crops and stock. Full description and terms upon application. ROBERT GREGORY, Grantou, N. Y.

FOR SALE—Village poultry farm, near Putnam, Conn.; good buildings, poultry houses for 400 chickens; $1,500; $600 cash. Box No. 76, R. D. No. 1, Putnam, Conn.

WANTED—Farm of about 80 acres, 40 acres tillable; must have orchard, running water, woodland, pasture, dwelling and outbuildings, about 100 miles of New York City; no agencies. Address F. E. SCHEEL, 433 West 46th St., New York City.

FOR SALE—3,500 acres ranch, 400 acres in farm, 3 sets improvements, 4 silos, 1,526 acres deeded, balance leased; deeded land, $14 per acre, lease thrown in; crop, live stock and equipment put in at reasonable price. E. D. HUNT, Owner, Childress, Tex.

FOR SALE—1,621 acres, farming, grazing and timber land in Allegheny Co., Md., 11 miles from Cumberland, on North Branch River, C. & O. Canal, and West Maryland R. R. runs through property; near churches and school. Will sell in one parcel or divide in sections. Liberal terms. R. M. W., care R. N.-Y.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

SITUATION WANTED by married American man as herdsman or farmer. GEO. RYDER, Yantic, Ct.

FARM PARTNER WANTED to work with owner on shares; New York State; married man preferred; particulars exchanged. OWNER, care Rural New-Yorker.

TEAMSTERS and Farm Laborers wanted to work in an Institution; salary, $32 a month and maintenance to begin with. Address SUPERINTENDENT, Letchworth Village, Thiells, N. Y.

WANTED SINGLE MAN—Must be good milker, who wants to learn advanced registry feeding and work; state nationality, age, wages wanted and reference. New York State, care Rural New-Yorker.

AMERICAN—Single; offered a good steady position at $35 per month, room and board, with American family; to take charge of private stable and care of lawn and do chores about the house. W. H. PITKIN, Congers, N. Y., near New York City.

A PRACTICAL HERDSMAN seeks position; am Scotch, married, 1 child, age 28 years; have been in this country several years and have held positions as herdsman and dairyman on some of the largest estates in the East; am well qualified and can give highest credentials. Address A. D. STEVENSON, Grillin Farm, Portchester, N. Y.

A METHODICAL, practical, scientific and successful general farm and dairy manager covering years of extensive and varied experience in exacting operations will be open for engagement Sept. 1. Eminent credentials will be furnished and nothing short of a first-class, responsible and remunerative position will be considered. If desirous, might consider cash proposition of lease of entire property. Address T. J. A., care Rural New-Yorker.

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

WANTED—Pair (heavy draft) fillies. C. H. SEIFERT, West Nyack, N. Y.

FOR SALE—Bartlett and other Pears by tree or bushel. ANTIETAM FARM, Landing Road, Smithtown, L. I.

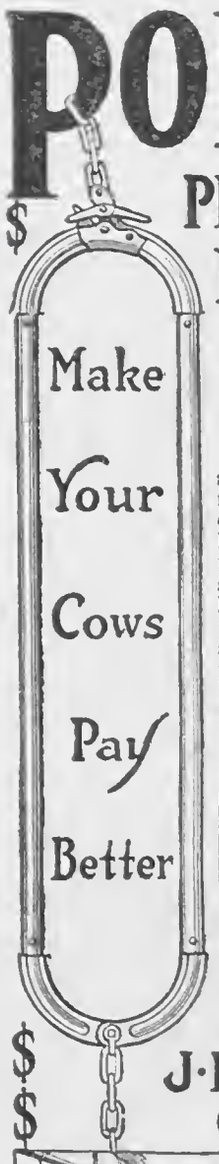
CEMENT BLOCK MACHINE—Nearly new; will exchange for registered Ayrshire calf or cash. Write W. D. HAMMOND, Marathon, N. Y.

BARTLETT and Clapp's Favorite Pears, $1.50 per doz.; Early Richmond Cherries, $1.25 per doz.; sample can prepaid, 20c. SENECA FRUIT FARM, Waterloo, N. Y.

FIG PRESERVES—Home made; a new delicacy for most people; made from choice fruit right from the tree; few people have ever tasted a fig as it ought to be; write for prices and sample to MRS. M. A. PARKER, Rickerly, near Dauphin way, Mobile, Ala.

PORTER

PERFECT BARN EQUIPMENT



A Clean Barn
Cow Comfort
More Milk
Added Profits
Less Labor

are results where Porter fixtures are used. Any cow, to do her best, must have the comfort, cleanliness and contentment such as Porter Dairy Barn Equipment affords. It will actually pay for itself in a year in added profits. Modernize your barn, make more money and save work by installing fixtures bearing the name that stands for recognized leadership, "Porter."

We manufacture the best litter-carrier, hay carrier, barn door hangers, etc. on the market.

Let our barn experts help you. Send us sketch showing size and arrangement of your building and we will send floor plans complete, free.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

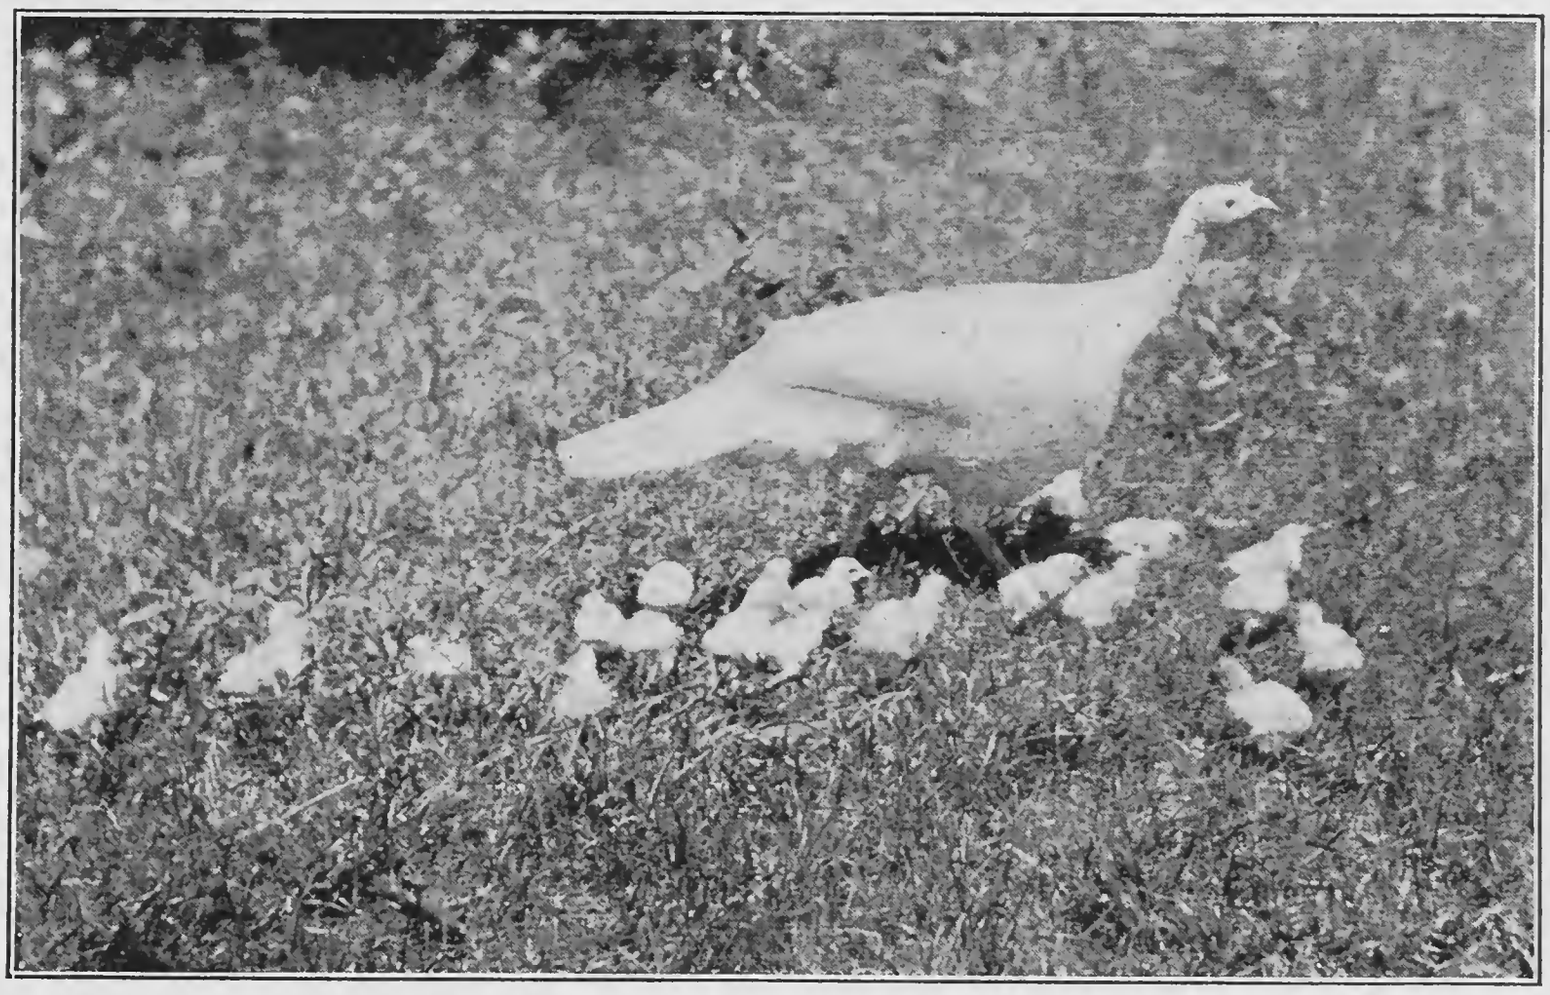
VOL. LXXIII, No. 4271. NEW YORK SEPTEMBER 5, 1914. WEEKLY $1.00 PER YEAR.

THE BUSINESS OF TURKEY RAISING.

Depends Largely on "Good Luck."

TWENTY years of experience in raising poultry on our old home farm, and in other localities, convinces the writer that there are three cardinal rules which must be followed. The first is have healthy stock for breeding purposes; next have clean quarters; the third and last is a joint rule, and embraces the subjects of regular feeding, also a steady and liberal supply of fresh water. These rules may be applied to the raising of all kinds of domestic poultry. Follow them, and barring epidemics, your success is fairly assured. Neglect them and the probabilities are that you will exclaim in disgust that there is no money in poultry raising. In the end, purebred fowls pay best. This has been my experience and I have tried both purebreds and grades.

HIGH PRICES FOR TURKEYS.—When you can get from 20 to 23 cents per pound for turkeys, you can readily see that you are making exceedingly good returns on the capital invested, and at the same time allowing fair remuneration for your time and feed. Say your hens weigh, on the average, 10 pounds and your toms 20 pounds (not extravagant figures). It is plain that you are in a profitable business for the amount of money it stands you. Twenty years ago you could buy a turkey hen for from 75 cents to $1, and a gobbler or tom for from $1.10 to $1.50, say $1.25 on an average. They have more than doubled in price since then, but the cost of raising them has not increased proportionately by any means. The prices I quote are wholesale, or those obtained from good commission merchants, should your birds be shipped in to the big city markets.



THE WHITE MOTHER AND HER BROOD. FIG. 474.

A GOOD RANGE NECESSARY.—In the matter of successful turkey-raising, you must be provided with good range, as these birds do not thrive in confinement. The White Holland does well on limited feeding grounds, and the color is much in its favor, as the most ignorant sportsman, either white or colored, cannot in any way mistake one of these pure white birds for a wild turkey, therefore he can give no reasonable excuse for firing at a White Holland, but can, and often does, put up a good excuse for killing the ordinary domestic turkey, when he is out for his wild brother on the same range.

FEED AND CARE.—On our home farm the rule was to feed the baby poults the yolk of hard-boiled eggs (after the first 24 hours) for the first few days when they had "cheeped" their way out of their speckled shells; then stale loaf bread, soaked in sweet milk, squeezed as dry as possible; later on cracked wheat, cracked corn, or rolled oats. The flock was kept up each morning till the dew was off the grass. There was generally a stir among us when a big Summer storm was brewing, and all hands, sometimes including the cook, were out in field, lot or orchard first to find, and then drive up the hens with their precious broods of poults. These were hurried to the big hovels, as fast as possible, for it was traditionary, that rain did not agree with a young turkey until he was at least 10 weeks old, and he could stand it much better if he was kept out of it until he was three months old; after that he was able to brave the elements. It was a pretty sight to see a flock of young turkeys after their infantile troubles were over, and they had reached the age when they could practically take care of themselves, as they ranged over the wheat or oat stubble, spread out in quest of grasshoppers and other insect pests. In watching them, you could figure on many fine dinners during the Winter season, and in addition to this some cash, when Thanksgiving, and later on Christmas arrived, meaning that the city folks would want to remember these historic occasions by the purchase of a high-priced turkey gobbler or hen. In New York Thanksgiving is usually a better market than Christmas.

ONE MAN'S SUCCESS.—The writer had a neighbor who, although not considered a poultry fancier, showed his ability as a turkey raiser by the following results: Starting out in February with 16 hens and two toms, he by careful and judicious methods, managed to raise to maturity, 216 full-grown turkeys that season, and sold them at the following prices: $1.25 for the hens and $1.50 for the gobblers (this was some years ago). These turkeys were raised on an old-time Virginia plantation, where the acreage in small grain probably averaged from 150 to 200, including wheat and oats, making fine feeding grounds for young turkeys. My friend's mode of procedure was as follows: When the birds began to mate, he let one tom run with the hens for a short while, then putting him up, turned out the other one. In this way the toms did not fight and a much larger number of fertile eggs was assured. When the hens showed a disposition to begin laying, they were placed in a large pen constructed of fence rails. The pen was covered to keep out the rain. Inside, comfortable nests were arranged. Gravel was hauled and a pile put in the pen, then quite a lot of half-burned oyster shells from an old lime pit were put in one corner of the pen. The hens were fed screened wheat and corn, and were kept in this inclosure, all through the laying and sitting period. As the young poults appeared in sufficient numbers, they were apportioned to the hens in good-sized flocks. During the day the poults were put out in triangular pens made of boards, and arranged so the hens were at liberty, but the poults could not get out. Each night all were put back into the big pen. Their feed was corn bread fed cold and with onion tops cooked in the bread. This feed was given till the young ones were about 10 weeks old, and then they were given dry cornmeal dough with cut-up red pepper mixed in it, and by the time they were 12 weeks of age they were given wheat screenings. Until they were about the size of an ordinary pullet, they were kept up at night, and never let out in the mornings until the dew was off the grass.

During the first two or three weeks, the young poults began to die, but it was found by putting copperas in their drinking water that they immediately began to improve, and after using this remedy for a few days there were no more deaths in the flock. The copperas was tied up in a piece of cloth, then placed under the water and the cloth tacked to the lower side of the trough. This simple remedy prevented any more sickness, and by the Fall of the year there was, as before stated, a splendid flock of 216 fine young turkeys. It was naturally robust stock.

RAISING SHOW BIRDS.—The writer was at one time interested in White Hollands, and exhibited them at the Virginia poultry shows, and State Fair, winning several ribbons. This season a neighbor, a young girl, sold six of her purebred White Holland toms for $5 apiece, and could have disposed of many more at the same good price, if she had been provided with more to sell. The fact of exhibiting your best birds, say a pen of three or four, will give you a much better chance to obtain higher prices for your best individuals, and will serve as an incentive not only to breed purebred birds, but also to encourage you to keep up the high standard of your regular flock of breeding stock. You also have a good chance to sell sittings of eggs during the breeding season. I sold over 150 one season at 25 cents each.

J. M. BELL.

R. N.-Y.—The great drawback to turkey raising in many localities is the prevalence of the disease called blackhead. The stock described above is evidently free from disease.

THE DENATURED ALCOHOL SITUATION.

TELL that Hope Farm man to cut his philanthropy talk and tell us how to make denatured alcohol. You told us a year or so ago that if the tax was only removed we could use all our wastes and run a gas-engine for less than nothing. But since the tax has been removed you have forgotten it all.

New York. T. W. ROGERS.

The Hope Farm man will do almost anything to help things along, but this is a little too much for him. We have told a dozen times all there is to tell about this alcohol tax matter. Some years ago a group of manufacturers worked up a nice little scheme to remove the tax on denatured alcohol; that is, grain alcohol to which wood alcohol is added. They were not strong enough to induce Congress to do this so, as is usual, they worked "the dear old farmer" for the job. Certain lobbyists connected with the National Grange got busy and worked up a great sentiment for denatured alcohol. The money used in working this up evidently came from these manufacturers, and it was a good investment! The papers were full of articles, showing how this cheap alcohol was to revolutionize methods of heating and lighting. A farmer could use his small pototoes, rotten apples and surplus corn fodder for providing alcohol and thus save coal and kerosene bills. Didn't they do all this in Germany and France?

No one could deny it! Are we to admit that Europeans are smarter than we are? Perish the thought! All we had to do was to "lick a stamp" and make Congress pass the denatured alcohol bill. The farmer followed these Grange "leaders," and did it, and the bill was passed. We have been waiting ever since for cheap alcohol for lighting and heating. It has never come, but those manufacturers got what they wanted for their manufacturing purposes. We pay as much or more for the goods which they make with the cheaper alcohol, and now see that the farmers simply acted as the cat's-paw to pull the chestnuts out of the fire.

Now why cannot farmers in this country make alcohol in small lots as is done in France and Germany? This Government has spent considerable money in trying to find out, and the following reply by the Chief of the Bureau of Chemistry tells the story as we understand it:

Cheap Alcohol from Small Stills.

Referring to your letter requesting information as to how to make alcohol on a small scale out of farm refuse, and pointing out the fact that this has been more successfully worked out in France and Germany than in America, you are informed that it undoubtedly is true that alcohol is being sold cheaper in Germany than in America in spite of the fact that it is made there in plants of small capacity. The difference between German and American prices is plainly due to various causes.

1. In the first place, the low price in Germany is partly due to the German system of governmental regulation of the alcohol industry, which by means of a kind of preferential bounty favors the agricultural distilleries, and especially those which use potatoes for a raw material at the expense of the commercial distilleries and such as use other raw materials.

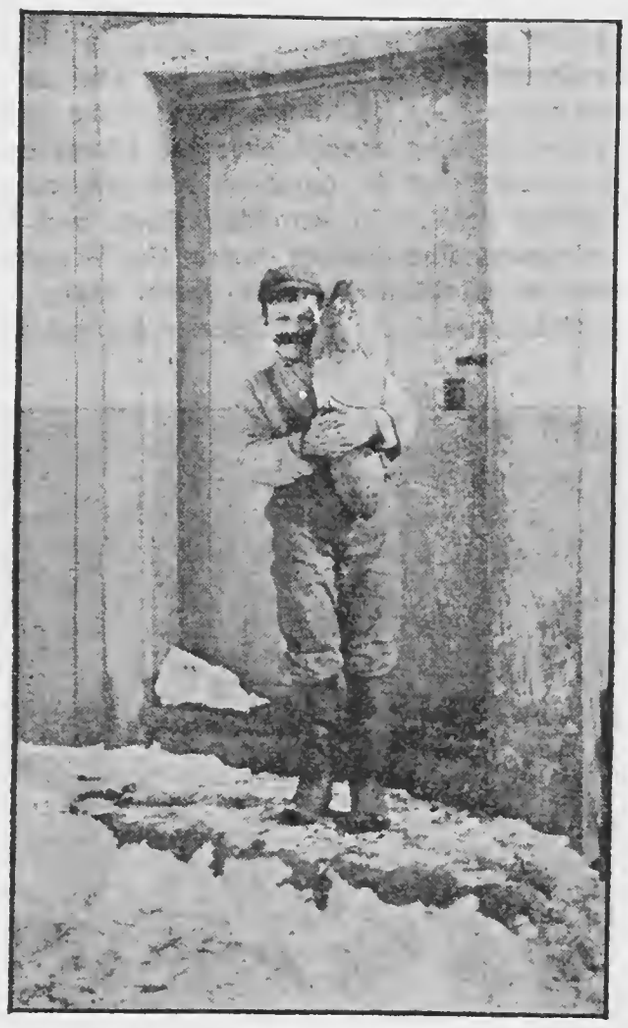
2. In addition, the low price in Germany is due in part to the operation of the Centrale fur Spiritus Verwerthung, which distributes about 90 per cent. of all the spirit made in Germany, and secures to the consumer a low price in that country in consequence of minimum distributing expenses.

3. A further explanation of the differences between the cost of producing alcohol in Germany and this country is to be found in the fact that labor is lower paid abroad than here, in consequence of which the initial expense of the distillery, the cost of raw material, and the operating expenses all are lower in Germany than in the United States. It is well recognized in all lines of manufacture that with equally good business management the cost of manufacture or production is always less in a large plant than in a small one. In Germany, however, the small distillery has this disadvantage very materially offset by the fact that the governmental regulations favor the small distiller at the expense of the larger one.

4. The manufacture of alcohol requires the use of ferment organisms, known as yeasts, which in order to produce satisfactory results must be used in fairly pure cultures. These organisms turn sugars, present in the fruits and other waste products, into alcohol. In order to succeed with this project, the farmer would be obliged to carry on fermentation processes under favorable conditions of temperature to give the yeast its opportunity to transform the sugar into alcohol. Any starchy material in the farm refuse could not be fermented without the prior change of these starches into sugars. This change is brought about by the use of malt, which the farmer would certainly find difficulty in preparing for himself, and which he might perhaps find difficulty in purchasing. Assuming an abundance of refuse containing starches and sugars, and assuming that the farmer could have access to malt and yeast, he would have to carry on the fermentation under favorable temperature conditions. He would then be obliged to distill the fermented material. If a cheap still were used the alcohol obtained would run about 50 per cent. strength, being too low to use for light, heat or power. If he were to obtain alcohol of the necessary commercial strength (90 to 95 per cent.), it would be necessary to have a much more complicated distilling apparatus, which would cost several hundred dollars, and which, being very complicated, would require a skilled man to assume responsibility for its operation and care. C. H. ALSBERG, Chief.

A CROP OF MANGELS.

THIS mangel (shown at Fig. 475), is one from a small lot raised on my farm in Massachusetts. I do not claim to be a mangel expert—in fact these are the first I ever raised. But I am trying another lot this year, and hope to raise larger and better ones as I gain experience. I did not raise mangels because of the nutritious qualities of the roots, for men of science tell us they are lacking. They can tell us how much of this or that ingredient a mangel or other feed contains, and also what sort of matter is required to make milk, eggs, etc., but I believe that they cannot tell us just how a



A MASSACHUSETTS MANGEL. FIG. 475.

cow's stomach or a hen's gizzard work on different articles of feed. It has seemed to me that these creatures require some kind of green feed in the Winter along with their hay or other dry fodder, and that a variety of feed is as desirable for them as for people. It was this notion that prompted me to try mangels in a small way, and if the experience gained can be made of benefit to others I shall be very glad of it.

The land on which this mangel grew was a deep light loam sloping to the south. Previous to this crop I had raised potatoes on it one year. I had then owned the land only one year, and it had not been plowed or fertilized for several years, and bore only a small crop of grass and a very fair crop of weeds. I plowed this piece deep, one Fall, and in the Spring I planted potatoes after harrowing, fertilizing and plowing again. The next Spring I plowed again just as deep as I could get down with the biggest plow and the heaviest team I could hitch up, disk-harrowed it lengthways, crossways, cornerways and every other way that would seem to work it up fine. I believe in grinding things up for any crop, and especially for mangels. Then I spread on a liberal dressing of barnyard fertilizer from the cow department. After that I harrowed some more. I presume the harrow went over this piece at least a dozen times all told. Next I limed the piece well and worked in with the smoothing harrow. It was planted in rows about two and one-half feet apart, a liberal amount of seed being used. Later on it was thinned out so that the mangels were at least 18 inches apart in the rows. Unfavorable weather soon after planting prevented many of the seed from coming up, so that there was much irregularity as to spacing in the rows, but I intended that no mangel should be nearer than 18 or 20 inches to any other mangel, and some were farther apart. The largest ones were the farthest apart, and I believe that I can raise more tons to the acre two feet apart than 18 inches. So many of this lot failed to come up that a second planting was made, causing unevenness.

The cultivator was kept running and the weeds were pulled out until the mangels were well along, when the cultivator alone was sufficient to keep them clean. Some experience in raising other root crops, as parsnips, for instance, had convinced me that plenty of room sideways as well as up and down was necessary in order to get size and length, and I believe that more weight to the acre will be had by giving it to them than by crowding. The entire crop was not weighed, which I now regret, but estimates by men more competent than myself place the weight at about 30 tons to the acre. But for unfavorable weather early in the Spring, the yield would have been much larger. These mangels were all very smooth, which I attribute to the lime. The mangel shown in the picture was one of the largest grown, but not larger than many others. It did, however, set down into the ground more than most of them, which depth may be seen by the rim in the illustration. F. B. DODGE.

Massachusetts.

THE MOON AND WEATHER CHANGES.

AT least one of your readers does not think that the question of the moon and the weather changes is finally settled, even though the Agricultural Department has settled it. One who has lived on the seashore and has seen the powerful influences of the moon on the water of the ocean, as shown in the various phases of the tides, cannot think it unreasonable to suppose that some influence may be exerted by the moon on the water in the earth's atmosphere. If the moon can attract a certain amount of sea water to a certain place at a certain time, it may also attract a sufficient amount of atmospheric water to a certain place at a certain time to combine with other necessary conditions to produce a rainfall. The varying relative positions of the earth, sun and moon which produce the varying phases of the moon and of the tides may produce varying effects on the water in the atmosphere. Even the slightly varying relative positions which produce the varying slant of the new moon may have sufficient influence on the sensitive vapor in the air to affect in some way the precipitation of rain. The moon's influence on the weather is still a "superstition" because it has not been reduced to a science.

Cuba. ELMER E. HUBBARD.

As to the above from Mr. Elmer E. Hubbard, in which the writer suggests a possible tidal effect upon the moisture in the atmosphere as a factor in determining the weather, atmospheric moisture occurs in two forms, viz.: (1) water vapor, which is an invisible gas, and (2) minute drops of water and crystals of ice, constituting clouds, haze, fog, rain, and snow.

Water, in a gaseous form is, like everything else upon the earth, and like the earth itself, subject to the laws of gravitation. The atmosphere, of which water vapor is one of the constituents, undergoes the tidal effect of the varying directions of the sun and moon. Atmospheric tides exist, but both theory and observation show them to be excessively minute. It should, moreover, be understood that a tide does not involve any considerable transportation either of water or air in a horizontal direction, but merely a gentle rise and fall. Thus, although the semi-diurnal tidal wave in the open sea, in the equatorial regions, moves westward at the rate of about 1,000 miles an hour, the speed of vessels traveling east or west is not affected thereby. Hence, the atmospheric tide could not, as Mr. Hubbard seems to suggest, cause a displacement of the water vapor in the atmosphere horizontally from one part of the world to another. On the other hand, the vertical displacement of the water vapor and other atmospheric gases, due to the atmospheric tide, is not only too small to have any appreciable effect on the weather, but—what is much more important—it is insignificant in comparison with the vertical movements of the atmosphere, due to the temperature contrasts such as those between night and day, and between clear and cloudy weather. The barometer, especially within the tropics, shows a very marked semidiurnal rise and fall, which, in appearance only, is analogous to the tides, but is really the result of the diurnal contrasts of temperature.

The same considerations apply to the movements of the particles of water, in solid or liquid form, occurring as clouds, etc., since these particles partake of the motion of the atmosphere in which they are suspended. In a perfectly still atmosphere they fall —very slowly, on account of the resistance of the air—but a slight upward component in the movement of the atmosphere suffices to buoy them up. As a rule their movement is mainly horizontal, under the effects of air currents, and these currents are

due almost wholly to two causes, viz., (1) temperature contrasts, and (2) the rotation of the earth on its axis.

The foregoing indicates the deductive method of attacking this problem, and evidently leads to a negative result. The inductive method would seek in the meteorological records maintained in all parts of the world some evidence of weather periodicities corresponding to the diurnal, monthly, or other periods of the moon's motion, or of the combined motions of sun and moon. This method has been applied by a great number of able students, using the refined mathematical analysis which is necessary to single out any lunar period, if such exists, from the periods due to known terrestrial causes—as, for example, the diurnal and seasonal fluctuations of temperature at the earth's surface. These studies have led to conflicting results. Many investigators claim to have found some indication of a lunar period in certain weather phenomena, and these have been variously attributed to the gravitational, thermal, or magnetic influence of the moon. The all-important fact, however, in connection with these alleged discoveries is that the effects in question are, if they exist at all, exceedingly small and, especially, that they are exceedingly small in comparison with the effects of ordinary terrestrial causes. They are, therefore, mainly of academic interest, and lie beyond the purview of the layman's observation and comprehension.

C. F. MARVIN,
Chief of U. S. Weather Bureau.

CARE OF FARM MACHINERY.

WHAT DETERIORATION COSTS.—According to the census of 1910 the farmer of the United States is buying yearly over $149,000,000 worth of farm machinery, an amount equal to over 3 1-3 per cent. of the total crop values as ascertained by that census. Much of this outlay represents the replacement of worn and discarded machinery rather than adding to the equipment. Probably not over nine-tenths of this amount is expended for new equipment, leaving $14,900,000 spent yearly for repairs and replacements alone. Any system that will reduce this repair expense seems to be worthy of careful study. Farm field machinery is always called upon to work under adverse conditions. Grit, storm, and sunshine, three enemies of the field machine, cannot be eliminated. The only course left open to the operator is to lessen their effect as much as possible.

CAUSES OF DAMAGE.—While grit might be considered by some as being the most potent factor governing the life of a machine, its action can be largely controlled by proper adjustment of the bearings and by the use of dry lubricants as graphite, on the parts of the machine most exposed to its action. Then too the parts worn by grit are usually the small parts of the machine, as boxes, etc., and they can be easily replaced, making the machine as good as new if the main parts of the outfit are still in good condition.

WEATHER CONDITIONS.—The weather is one of the most potent factors affecting the life of a machine. Storm and sunshine are at work every minute that the machine is out of doors, whether it is being used or not. Practically all farm machinery is painted by dipping, leaving a thick, inelastic coat of cheap paint. The heat of the sun on the metal parts of the machine causes them to expand, cracking the paint, which flakes off, leaving the metal beneath it to be attacked by rust. The wooden parts suffer to even a greater extent than the metal from the weather. They are made from the ordinary slash-sawed stock, and it is a well-known fact that this type of lumber shrinks, swells, checks and warps much worse than quarter-sawed material. Also much of the woodwork to field machinery is of a kind that has little ability to withstand weather conditions. The machine gets a soaking, the wooden parts swell, crushing bolt heads and other metal parts into them, then in drying out the parts warp, checks develop, and the material shrinking, causes the bolt to be loose, and it loses its holding power. Winter conditions affect the machine mainly by water running into the crevices and freezing there, forcing the adjacent parts away from each other. Housing then, it would seem, is one of the principal things to look to in prolonging the life of a farm machine. The shed need not be expensive, the only requirement being that it protects the machine from the weather.

A MACHINE SHED.—The shed illustrated is 24 feet deep by 20 feet wide. It cost less than $50 and will protect over $500 worth of field machinery and implements. It is not an ideal shed by any means, as the depth is too great, making it necessary to use some forethought when storing the machinery so that the implement wanted will be at the front of the shed, but it shows what can be done with a small amount of money. The cost of material was as follows:

Sheathing for roof, sides, and one end, 1,250 feet at $15 per M.	$18.75
Roofing paper, 7 rolls, at $1.25	8.75
8 planks, 12 foot x 8 inches x 2 inches, for plates, 128 feet B.M.	
18 planks, 14 foot x 6 inches x 2 inches, for rafters, 212 feet B.M.	
8 boards, 12 foot x 6 inches x 1 inch, for collar beams, 48 feet B.M.	
Total 388 Ft. B.M.	
388 Ft. at $20 per M.	7.76
50 pounds nails and spikes at 2½	1.25
Total cost for material	$36.51

The cost of the posts is not included in the above,

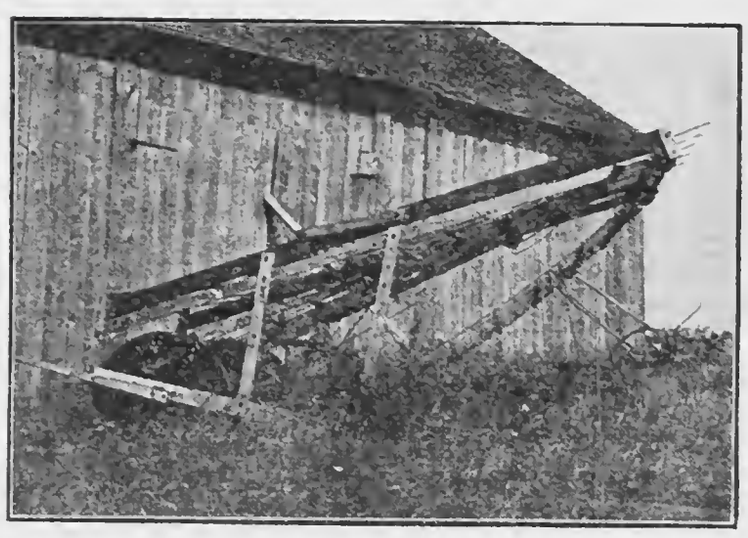
POOR SUMMER STORAGE FOR THE SLEDS. FIG. 476.

for the seven posts used were made from round cedar rails found on the place. Neither was the labor cost included, for it was built with ordinary farm help during slack times. In fact the shed shown was much lower than the above in price, for all of the lumber used was made from material found on the farm. The plates were made from elm planks, and the siding and roofing from cull pine obtained from down trees. On a large farm it is far from convenient to bring the field tools to the buildings every night and a few of these sheds, built at

CHEAP, EFFICIENT TOOL HOUSE. FIG. 477.

points where most of the work is carried on are a great convenience as well as saving. At night, when through with the machine, run it into the nearest shed, then if conditions are such that you do not return to the field the next morning the machine is protected.

GENERAL CARE.—When in use take time to oil your machinery occasionally. The judicious use of machine oil saves horse feed as well as repair bills. Generally speaking a medium thick oil, one having a considerable body, is best for farm machinery. It is seldom that their bearings are very finely finished



SHORT LIFE FOR THE HAY LOADER. FIG. 478.

and this oil is needed to fill the little irregularities in them and keep them from grating on each other. Graphite is fine for this purpose and an application to the chains and gears of mowers and binders helps much toward a light running machine. The ordinary stick stove polish can be used for this purpose.

REPAIRS.—Keep a note book for the purpose, and when a machine is to be laid up until the next season, go over it carefully and note the repairs needed. It can be done more easily then than at any other time, the machine is accessible and the weak places are fresh in mind. Order these repairs, and during stormy weather they can be fitted and the machine will be ready for use when the season opens, instead of having to wait at this time for repairs to be ordered. Keep the machine painted. A good coat of paint is a protection from the weather, acting as a portable covering for the machine. Asphaltum varnish makes a cheap and good covering for the metal parts, while red lead paint is equally as good for the wood. The red and black make a good color combination as well. This painting can be done during the slack season, and does much to insure better care for the machine, for there is no man that will not take pride in a well-painted machine, and try and keep it in as good condition as possible.

ROBERT H. SMITH.
New York.

MAKING SAND HOLD WATER.

CAN anything be put on sandy soil to make it stand the drought? Things in garden literally dry up sometimes.

E. B. W.
New York.

First let us think what makes a soil dry out so rapidly. There may be in the same township a sandy, open soil, and another which we would call a clay loam. Each receives the same rainfall, yet after three weeks of dry weather the sand is as dry as powder, while if we dig or kick into the other we turn up dark-colored moist soil. Why? One soil is able to hold its moisture better than the other. A soil loses its moisture through drainage and evaporation. Naturally in the coarse, open sand the water will run away freely, while in the more compact loam the drainage cannot be so rapid. The same is true of evaporation. The air, warm and dry, works freely into the open sand and carries off the moisture better. The problem therefore is to change the character of the sandy soil if we can, and make it more like the loam. The particles of the sand are coarse and held loosely together. The loam particles are smaller, some of them so small that they bind the larger ones together and fill in between them. The sand is light-colored and contains but little if any organic matter or humus. The loam is darker in color, and contains a good share of this organic matter, which holds the moisture somewhat like a sponge. A garden or small space of sand can be made more compact by working into it a good quantity of fine, sifted wood ashes. This ash will work in between the particles of sand and help hold them together. A good dressing of air-slaked lime will act somewhat like mortar to compact the sand. Air cannot enter it so readily and thus the water is not taken out so fast. Heavy dressings of stable manure worked into the soil year after year will increase the amount of organic matter, and weeds, wastes of crops and cover crops should all be plowed or spaded under. Such soils should never be left bare through the Fall or Winter. There should always be left growing a crop of rye, turnips, clover, vetch—anything that will make a growth that can be worked into the soil. This constant addition of organic matter will finally change the sand to a loam which will have the ability to hold moisture and thus withstand drought. There is no quicker way of doing it except the expensive method of using stable manure heavily. On the peninsulas of Delaware and Maryland are many instances where land miracles have been performed by using lime and chemicals and plowing under cow peas, Soy beans and Crimson clover. Starting with dry, leachy sand, farmers have in a few seasons been able to build up dark-colored loam soils which hold water well and produce large crops.

Registering Farm Names.

THE State of Missouri has the following law governing the registration of farm names:

Any farm owner in this State may, upon the payment of one dollar to the clerk of the county court in the county in which said farm owner may reside, have the name of his farm duly recorded in a register which the county clerk shall keep for said purpose, and shall be furnished a certificate, issued under seal, and setting forth the name and location of the farm and the name of the owner: Provided, that when any name shall have been recorded as the name of any farm, such name shall not be recorded as the name of any other farm in the same county, except by prefixing or adding designating words thereto.

That is a good law for any State. It is a pleasant thing to name the farm, and a good thing to have a trade mark. It leads every member of the family to think more of the farm. When the farm is about all you have it should have most of your thought.

THE Kansas Agricultural College has started tests to show the value of Alfalfa as silage. In small experimental silos are being preserved respectively, Alfalfa alone, Alfalfa with corn chop, Alfalfa with molasses, Alfalfa with molasses feed, Alfalfa with straw, Alfalfa with rye, and rye alone.

CROP REPORTS.

August 21. We are just getting the first good rains since last May; think there has been a greater fall in August to date than in June and July together. The season has been a peculiar one, the early part so wet that all Spring crops were got in very late, then came a long dry spell with a good deal of very hot weather. I think we have more days with high humidity than any Summer in years. Crops as we see them run about as follows: Wheat the best in a good many years, in fact a poor piece was the exception. Price now $1 and possibly a little more. Hay a good crop; offering $13 per ton in the barns for baling to ship. Meadows are very much burned and pasture is short. One man we know with a large milk dairy is feeding hay now to keep his stock up. Oats are poor in spots; on the whole about an average crop; around Rochester they are much poorer than in other parts of Western New York. Barley better than oats, dry weather did not seem to hit this crop so badly, possibly because barley is usually sown earlier than oats. Corn is below the average, many very poor pieces, came up spotted and the drought hit it hard; on the whole about one-half to two-thirds crop. Beans below the average, but the price is soaring so that on the whole think the grower will get much more for the crop than any year for the past five. Potatoes in this section do not come anywhere near the government average as we read it in the papers. They came up poorly, are spotted. We saw pieces last week that will not bring the grower $5 per acre. One thing is very plain to be seen this season, viz.: the farmer who took the time to roll down his ground every night after plowing is getting the best crop. There seems to be no failure to this. Another thing the man who took pains with his seed is going to have the best crop. We were in one field last week and the grower pointed out where he took pains to sort his seed carefully throwing out every potato that seemed to be diseased in any way, and the result is that where he did this he has an almost perfect stand, while on the rest of the field it is safe to say there are 10 to 15 per cent. of missed hills. Bugs have not bothered at all in many places. Walking through several pieces we did not see one bug. This is a very unusual thing. On the whole we should say the crop was 10 per cent. below the ten year average. Cabbage not looking good, and the acreage seems to be less than for a number of years. Apples show well in every orchard, although we have not been through the best orchard sections, so our observations hardly count for much. Is the war going to affect the price unfavorably? To us it would seem so. The export of green fruit to England must be curtailed and of evaporated fruit almost entirely to the Continent. I have been talking with a grape grower who has a vineyard on Canandaigua Lake. He thinks his crop is nearly three times as large as a year ago, and the prospect seems to be good for the wineries taking all they have at good prices, as the importation of wines, etc., must be entirely stopped, and the shortage will be made up by wine manufacturing in this country. As a result they are expecting to have to pay much higher prices. C. I.

Monroe Co., N. Y.

August 19.—The market for nearly all produce is steadily rising. Wheat 90; corn 74; oats 34; rye 70; barley, per cwt., $1-$1.20; beans $2.50 per bushel; Timothy hay $10. Hogs 8; lambs 6½ to 7; good steers about 7½; chickens 14; broilers 18. Potatoes about $1 per bushel. Butter 25; eggs 19; cream (by butterfat) 26. H. D. B.

Bath, Mich.

Our local markets are paying for eggs 22; dairy butter 25; creamery for butterfat 29½; wheat 90; navy beans $2.25; apples 40 to 60 for early varieties. Beef cattle six to eight cents per pound live weight; feeding cattle seven cents and scarce. Cows, new milch with any quality, $60 to $80 per head; hogs 8½; lambs 5 to 7; chicken 13; hens 11. Best wheat crop in years, average 30 bushels per acre. Corn good, oats fair; beans fair; Winter varieties of apples good. This is a late potato section and our market does not open up until October 1. Prospects for crop are good. In fact this is the most favorable season so far that we have had in years. J. S.

Belding, Mich.

Organization for Distribution.

AS a movement for the securing of better facilities for the distribution and marketing of fruits and produce the growers of Sodus, N. Y., have organized a branch of the Eastern Fruit and Produce Exchange. President Seth J. T. Bush of the central exchange at Rochester recently appeared before a gathering of Sodus growers, and in an address along coöperative lines enumerated the advantages of organization for the growers. Mr. Bush pointed out that under the present method of distribution only about 35 cents of the consumer's dollar returned to the grower. He declared that the new movement was "a deliberate attempt on the part of the growers of New York to obtain every cent of legitimate profit for themselves." No dealers are permitted to hold stock in the association and no commission men have a hand in any part of the transactions between growers and the final dealers. Through the North American Fruit Exchange of New York the State association will conduct much of its business. Representatives are located in all centers to protect shipments and all claims are collected by the exchange. Mr. Bush is a resident of Morton and last year a branch of the exchange was organized there with sixty members. When the branch opened the local dealers were paying one and one-half cents per pound for peaches. The members of the coöperative system realized nearly double this amount with the result that the Morton exchange is getting the bulk of the forwarding business.

For FALL planting. Also Raspberry and Blackberry Plants, and Fruit Trees. All leading varieties. Catalogue free. HARRY L. SQUIRES, Remsenburg, New York

The Sash that eliminates Mats and Shutters

The sash that doubles efficiency in the garden and cuts the cost one-half.

Extra-thick, of cypress, everlasting, double-glazed with an air-space that admits the sun, but not the cold, this sash has become the standard in every up-to-date garden and has rendered the old-style single layer putty sash obsolete.

STILL WONDERING

Says H. B. Fullerton, who has developed gardening in Long Island by leaps and bounds: "The only thing on earth to use is the double-glass sash." So say all who have used the sash diligently, not only on Long Island, but in every state in the Union.

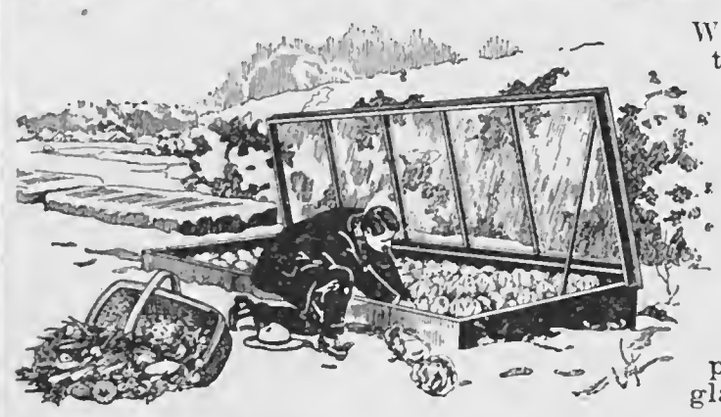
GET OUR CATALOGUE

The catalogue, which is free, explains everything in detail. Get it, if you are to know how to garden to the best advantage.

The Sunlight Greenhouse on which the sash are also used is inexpensive, attractive and a highly profitable addition to any garden. See the catalogue.

Write today for the Free Catalogue and enclose, if you wish it, four cents in stamps for Professor Massey's helpful booklet on the use of cold-frames, hot-beds and small greenhouses. **Sunlight Double Glass Sash Company, 924** E. Broadway, Louisville, Kentucky.

CONTINUE YOUR GARDENING ALL WINTER



Why be satisfied with only the few months of summer harvest from your garden when you can enjoy "seeing things grow" throughout the cold and dreary winter months? Lutton's Miniature Glass Gardens provide the means. You'll find a great deal of pleasure and a full measure of profit in gardening under glass.

To meet the popular demand, we manufacture a special sash and frame 8 ft. 4 in. long and just wide enough to put in a three foot space on the south side of the house. A child can ventilate the frame with ease.

Price complete, ready to put together. Freight prepaid anywhere in U. S. Double glazed $1.00 extra. **$10.50**

Prompt shipment guaranteed. Planting instructions sent with each frame. We manufacture regular 2, 3 and 4 sash frames, single and double glazed. Our catalog also illustrates our new portable greenhouse. Write for it today.

WILLIAM H. LUTTON CO.
225-7 Kearney Ave., Jersey City, N. J.

30,000 BU. SEED WHEAT

grown on 700 acres of Lancaster County, Pa., best wheat soils. Such a valuable stock of Winter Wheat Seed was never before accumulated. The varieties—a dozen of them, include the hardiest and most productive known. Some of them great stoolers—that only require one to one and a fourth bushel to sow per acre. PENNSYLVANIA BLUE STEM—LEAP'S PROLIFIC—RED WAVE—FOUR-ROWED FULTZ—LANCASTER FULCASTER—STONER'S MIRACLE—PRICE'S WONDER are among the varieties.

Seed is GRADED CLOSELY—clean of RYE, CHEAT, COCKLE, SMUT and GARLIC.

You can grow much more wheat per acre if you will sow the best varieties. The cost is moderate. Freight is prepaid—and bags free at prices charged.

If seed sent you don't please—you may return it and we'll do the same with your money—you are the Supreme Court in the matter.

Highest grade TIMOTHY SEED, CRIMSONS, VETCHES, ALFALFA can be ordered along with your Seed Wheat.

Our Wheat Catalog is the most elaborate issued. It is free; also wheat samples if you ask for them. Write to-day. This announcement appears only once.

A. H. HOFFMAN, Seedsman, LANDISVILLE, Pa.

Kelly's TREES True to Name
Backed by 28 Years Experience
And sold direct from our nurseries to your orchard at Grower's Prices. Apple, Pear, Peach, Plum, Cherry and Quince trees, also small Fruits and Ornamentals, in all the leading varieties, guaranteed Free from Disease, True to Name, and fresh dug. We know the history of every tree we sell because we grow them in our own nurseries right here in Dansville—Dig, Haul, Pack and Ship every tree under our personal supervision. You can order from our catalog just as if you were doing business with us personally. Your trees will be selected by one of the firm, packed carefully and shipped promptly—Write for our catalog—Now is the time to plant apple trees. This year we quote low prices for the best stock we have ever grown. KELLY BROS., WHOLESALE NURSERIES, 205 Main St., Dansville, N. Y. *You'll never regret planting Kelly Trees*

Fraser's Apple Trees Are Right

The Bolton Fruit Co. says, "Those Apple Trees were the finest nursery stock we ever saw."

All of Fraser's trees are of the same grade—they are grown in a modern nursery, given extra care and cultivation, dug when the wood is ripe, packed carefully, shipped safely. The price, too, is low for such good trees.

FRASER'S TREE BOOK tells what Apples are profitable for the Eastern planter, and how to select the kinds for your own locations. Send for a copy—it will cost you nothing.

SAMUEL FRASER, NURSERYMAN, 121 Main St., Genesco, N. Y.

Fall Lettuce.

COULD Grand Rapids and Big Boston lettuce be grown in the open as late as November 15 if mulched with straw about frost time? If so, when should the seed of each of these varieties be sown? I wish to grow the plants in a seed bed and transplant. H. N.
Cleveland, Ohio.

Seed of Grand Rapids lettuce for transplanting into plant houses and cold frames to be marketed from Thanksgiving to middle of January is being sown today (August 18) in the open ground by myself and other gardeners in this section about 40 miles north of Cleveland. The season at Cleveland is longer than here, and it is barely possible that H. N. might get sufficient growth on Grand Rapids lettuce to make it marketable, but it would depend entirely on having a very warm Autumn. If he could transplant into a frame sheltered from cold north winds and cover with muslin sheeting his chances for success would be much better. Head lettuce cannot be grown under the conditions mentioned. It goes without saying with a low November sun there would be little warmth in the open ground after frosty nights. L. B. P.

The Pearl Strawberry.

WILL you give experience with the Pearl strawberry? Is the variety suitable for either hedge-row or hills? Is it productive enough to warrant growing it for market. G. W. H.
University Park, Colo.

This variety is one of the later or newer introductions, and has not been under trial in a general way throughout the country. In Northern New Jersey, on rather heavy sandy loam, it has proven quite successful. The plant seems entirely healthy, is a strong grower, a good cropper and a good plant maker. It seems well adapted to growing in hedge or matted row. It is supposed to be a seedling of Gandy, but is of more robust growth, much more prolific and somewhat later. The berries average quite large, which are irregular in form, and lighter in color than the Gandy. Not firm enough for long shipment, but the high quality makes it a desirable variety for the home garden or nearby market. Scarcely any variety of strawberry will succeed in all kinds of soil and in all sections of the country, and it is therefore never advisable to plant largely of any untried sort. K.

Root-maggot in Turnips.

WILL you tell us what to do to rid turnips of a small white worm which is eating the roots? O. A.
Sullivan, Me.

This insect is the larva of a small black fly that lays its eggs around the stems of the plants at the surface of the ground, varying in number from a dozen to 20 or more at each laying. In a few days the young larvæ hatch out and immediately penetrate the soil around the plant and commence feeding on the root stems. They are more or less prevalent in all sections of the country where any members of the Brassica family are extensively grown, especially cabbage and its near related species. No other insect attacking the Brassica family is as destructive nor as difficult to combat successfully as the root maggot. Its operations being confined entirely to the underground portion of the plant, its presence is seldom, if ever, suspected until the plant begins to wilt, when in most instances the plant is beyond recovery, particularly in dry weather. Unfortunately there is no known remedy that is reliable. Heavy liming around the stems of the plants has in some instances proven quite successful when applied to cabbage or cauliflower, but its application to turnips would be impossible and unprofitable even if it was an infallible remedy. The mature insect or fly breeds in manure and the use of stable manures on lands used for growing cabbages, turnips, etc., is almost certain to result in root maggot, with more or less damage and loss resulting from their attack on the root system of the plants. Many growers of these crops are abandoning the use of stable manures and instead grow soiling crops for humus and use chemical fertilizers in the making of the crop. In consequence there is very little trouble from root maggot. Rotation of crops is advisable, and is to be specially recommended for soils that have long been cropped to cabbage and its related species. K.

APPLE SHIPPERS' MEETING.

THE International Apple Shippers' annual meeting at the Copley-Plaza Hotel, Boston, August 5, 6, and 7, was a very successful affair. The apple display was good for this season of the year, when most varieties of apples are not yet matured, yet some fully matured were seen side by side with half-grown specimens of the same variety. Of course these came from widely different sections of the country; in fact the exhibits came from all the apple growing sections of our country. Some special features of this display were a box of last year's Baldwins in apparently perfect condition, at least on the outside, and were very attractive in color; in fact they looked as good as any of the fresh picked on exhibition. These were shown by J. H. Hale. Another was several pecks of nice apples packed in paper packages ready to ship by parcel post; these were shown by a local grower. The display of apple products was the largest I have ever seen, and was especially attractive.

I was pleased to see a few specimens of perfect Flemish Beauty pears, as I had never, that I remember, seen any before, as they will not grow in New England anywhere near perfect, but I am told they did years ago. On the morning of the second day ex-Gov. Guild gave a very nice talk on the history of the apple, and placed it by many references of past and present appreciation at the head of all fruits, both as a luxury and a stand-by and health-giver, and for food value. The origin of this fruit is unknown but is believed to have been first heard of in Palestine, and traveled from there to Greece, then to France, then to England, to America in New England, thence to the Middle West, and Pacific coast, across the water again to the Philippines, and from there are shipped to Asia, thus completing a journey around the world. A very interesting discussion was indulged in as to how to boom the National Apple Day, which is set for October 20.

Members from Chicago, Cincinnati, Rochester and other cities told how merchants and growers gave free apples to newspaper men, editors and even the newsboys, to hospitals, schools and even in some cases to horses on the streets. These methods tends to bring out much free advertising in the daily papers, and are very helpful in increasing consumption and consequently later and larger sales. One man in Chicago sold at a small profit all the apples he could on a certain day, and disposed on that day of 128 barrels and 86 bushels. This helped sell other stock in the store, and 1,000 barrels of poultry extra had been ordered late in the afternoon of that day to supply the trade. This year Pittsburgh intends to give away a carload of apples, on this day largely to newsboys, etc., and it is intended they shall have a generous supply. One produce man told of selling apples at $3 per barrel and $1 per bushel to a retailer who charged $1 to $1.50 per peck for these and $8 per barrel. He believed as any sensible man would, that this was unreasonable, and also tends largely to discourage buying and consuming very largely, and is a poor policy to follow. Sell at a reasonable profit and your sales will increase much faster than by the other plan.

Secretary Phillips reported 560 paid members, a slight increase over a year ago. These members were from 212 cities; $11,000.54 was collected the past year and balance on hand is $4,900.70. A very hot discussion was held on the topic of ocean freight charges and losses by delays on the passage across. A lower rate is very essential, but cannot be obtained, or any satisfaction from losses, because nearly all this is carried in ships not under the American flag, and consequently not liable to American laws. One shipper lost $8,000 on one shipment because the ship was unnecessarily delayed seven days over time in a hot spell. He carried the case to an English court of law, but got no satisfaction or damages. This is a strong argument for more American vessels and the establishment of an American merchant marine, and a committee was appointed to confer with President Wilson and Congress as to the urgency of this without delay. It was stated as important that our inland water ways be improved and new ones opened, as these do the work five to seven times cheaper than the steam roads; also the improvement of country highways is very necessary in many States, and should receive the attention of this association. Producers can work with us in many ways to improve conditions, and we should ask their help and work with them in all possible ways. A. E. P.

Fall Cover Crop.

WHAT cover crop should be used for a field to be planted to cabbage next year, and when should it be sown? It is now planted to corn, but I should not like to sow and cultivate in because I should like to pick off stones first, Fall plow, sow cover crop, then plow in next Spring. H. O.
New York.

In such case about all you can do is to sow rye after you have fitted the ground. The rye can be seeded up to the middle of October and give a fair crop to plow under the following Spring.

Now is the time to paint!

Right Now! In the Fall Is the Best Time

EXPERIENCE has proved that the best season for painting is in the fall. The wood is much drier after exposure to the hot summer sun. Hence there is better penetration. The chance of rain to interrupt the job is less in the fall. There are fewer bugs at this season to get into the paint. Then a fall job of painting puts the building in prime condition for winter — closing up the cracks and crevices and keeping out the penetrating winds.

Lucas Paint

Experience—65 years of it—has also proved that the best paint for any season is Lucas Paint. We have been making Lucas Paint since 1849, and have learned in that time how to produce the most durable, most elastic and toughest paint ever made. This vast experience has enabled us to establish a standard of what **really good** paint should be. Now—every can that leaves our factory must meet this standard after undergoing innumerable tests.

FREE—Expert Advice—"When and How to Paint"

Write today to our Service Department for expert advice on your painting question. We will furnish you information of the most valuable kind pertaining to your own needs that will save you many a dollar. We will also send our book, "When and How to Paint." Send at once.

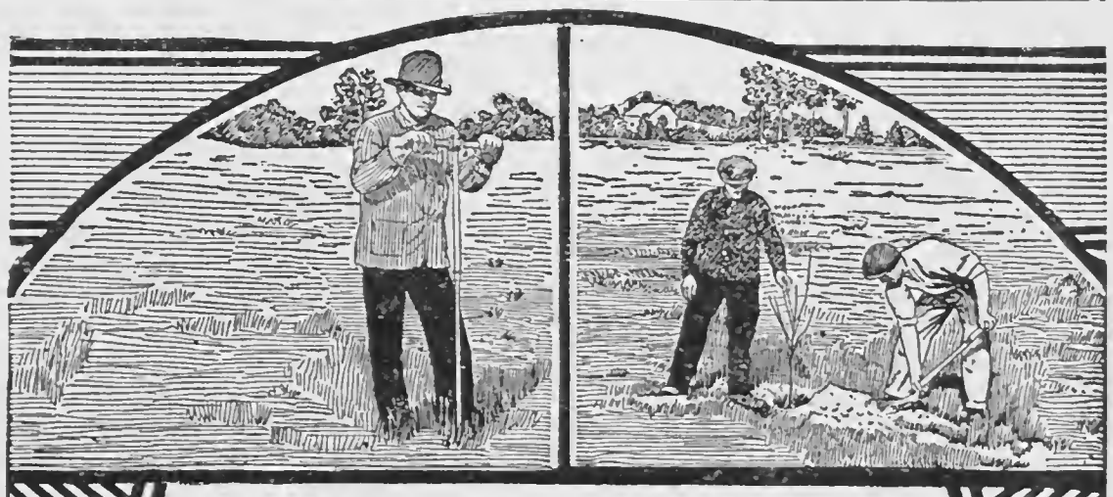
TILE DRAINED LAND IS MORE PRODUCTIVE

ROUND TILE

Carries off surplus water. Increases the value of your land. Acres of swampy land reclaimed and made fertile by using JACKSON'S DRAIN TILE. We are producers of Albany Blue Slip Clay, Hollow Brick and Blocks. Dealers in Sewer Pipe, Flue Lining, Fire Brick and Chimney Tops. Send for catalog and prices. John H. Jackson Tile Co., Inc., 89 Third Ave., Albany, N. Y.



Blast Holes Now for Tree-Planting

Put your soil this fall into prime condition for fruit trees next spring. Punch a hole and explode a half-charge of Atlas Farm Powder where each tree is to stand. The subsoil will be broken up for yards, and the frost, air and moisture will mellow it all winter. The cost will be little, and by using

Atlas Farm Powder
THE SAFEST EXPLOSIVE
The Original Farm Powder

you can have healthy, vigorous trees that will bear two years earlier than trees in spade-dug holes. The deeper the roots go, the better the trees will be, and roots of trees planted the Atlas way go down deep and spread out far.

Use Atlas Farm Powder, too, to regenerate your old orchards, to dig ditches, and to clear land of stumps and boulders. It is made especially for farm use, and is sold by dealers near you—easy to buy, easy for you to use.

Send Coupon for Farming Book—FREE

Our illustrated book, "Better Farming," tells how to grow bigger crops, clear land, and do other farm work safely, quickly, and economically with Atlas Farm Powder, the Safest Explosive. Mail the coupon and get it FREE.

EVENTS OF THE WEEK.

DOMESTIC.—Five persons were killed, seven seriously injured and twenty-five others less painfully hurt in Wilkes-Barre, Pa., August 20, in a severe electrical storm.

August 23 fire destroyed the plant of the Excelsior Brick Company at Haverstraw, N. Y., entailing a loss of more than $75,000.

With the close of business up to August 22, 16 ships had passed through the Panama Canal, and it had earned, during its first week of service, approximately $55,000, which does not include the revenues collected from barge service and payments made in advance for ships on their way to go through the canal. The Ancon, heavily loaded, passed through the canal on the day of its opening, a week ago. Of the ships that have used the canal this week 14 were American, one British and one Peruvian.

It was announced at St. Paul, Minn., August 24, that a motion for a modification of the decree filed in the United States District Court on August 12 in the International Harvester Company case has been filed by its solicitors. It is asked that the decree shall not include in its provision the business done by the company in foreign countries, and that limitations as to plan for carrying out the decree be removed.

The Guaranty Trust Company of New York has begun suit against the North German Lloyd Steamship Company for $1,040,467, charging failure to deliver $5,000,000 in gold shipped on July 27 by the trust company in accordance with a contract of transportation as embodied in the bill of lading. In connection with the suit the trust company, August 24, libelled the Kronprinzessin Cecilie of the North German Lloyd Line, now at Bar Harbor, and on which the gold was shipped for delivery in Europe.

The Goldschmidt German wireless station at Tuckerton, N. J., which has been doing business by courtesy of the Government since it was opened early in August without a license, was closed, August 24, by order of acting Secretary of Commerce Sweet. As the Hague agreement prohibits the licensing to a belligerent of a wireless plant on neutral territory the company has not been able to get a license. But by the courtesy of the Government a permit was granted to the Goldschmidt company, under which, it had transmitted commercial messages in plain English. A censor has been at the plant to see that this privilege was not abused. The notification to Theodore R. Lemke, manager of the Goldschmidt company, from acting Secretary Sweet said, however, that the station had been operating illegally and that confiscation of the apparatus would be the penalty. At the Sayville, L. I., station of the Atlantic Communication Company, Berlin despatches announcing German victories near Metz were received August 24. It was admitted that the station has been in communication with the German War Office almost daily since the outbreak of hostilities. Only the messages sent to Germany are censored. The station has not been in communication with any of the German battleships since the censor arrived at the station.

The findings of the courts-martial which tried twenty-two officers and men of militia, at Denver, on charges growing out of the Ludlow strike battle of April 20 were made public, August 26. All the defendants were acquitted. The militiamen were charged with murder, manslaughter, arson and larceny.

Ten persons lost their lives when the Canadian Pacific steamship Princess Victoria rammed and sank the Pacific-Alaska liner Admiral Sampson, August 26, off Point No Point, eighteen miles from Seattle, Wash. The Admiral Sampson, with 56 passengers and a heavy cargo, was bound for Alaska, while the Princess Victoria was en route to Seattle. A large hole was torn in the side of the former vessel and she filled and sank in four minutes. The Princess Victoria's bow was badly stove in, but she remained afloat and was towed to Seattle.

FARM AND GARDEN.—By vote of the Executive Committee the next biennial session of the American Pomological Society will be held in Berkeley, California, September 1, 2, 3, 1915.

One thousand farmers met at Dublin, Ga., August 25, and adopted resolutions urging the Federal Government to put a production tax on the 1915 cotton crop in order to reduce the yield.

The annual convention of the Society of American Florists and Ornamental Horticulturists was held at Boston, August 18-21. Nearly every State in the Union, and also Canada was represented. The following officers were elected: President, Patrick Welch, Boston, Mass.; Vice-President, Daniel MacRorie, San Francisco, Cal.; Secretary, John Young, New York, N. Y.; Treasurer, William F. Kasting, Buffalo, N. Y. San Francisco was selected for the next convention. The membership of this society is now 2,004, and it is in a strong financial condition. The Florists' Hail Association reported insurance upon 39,303,677 feet of glass, and total receipts during the year of $53,764.75.

At the meeting of the American Gladiolus Society in Boston, August 19, the following officers were elected: Charles F. Fairbanks, president; Henry Youell, secretary; A. E. Kunderd, treasurer; Maurice Fuld, I. S. Hendrickson and T. A. Havemeyer, executive committee; Prof. A. C. Beal, A. C. Hoddis and L. M. Gage, nomenclature committee.

The Massachusetts Agricultural College has prepared an extensive exhibit to be displayed at a number of fairs this Fall, and will give a number of educational demonstrations. These include live stock, horticultural and home economic subjects.

THE EUROPEAN WAR.—A great battle between Germans and Allies began south of Brussels, August 22, the line extending 20 miles from Namur to Charleroi. August 24 the Allies were driven back by the German forces. Terrific losses are reported. It was said that the Belgian dead numbered 16,000, the total wounded 50,000, while 2,000 British casualties were reported.....The Germans demand from the city of Brussels a war contribution of $40,000,000 and $10,000,000 from Liege. It was announced by the French Foreign Office, August 23, that France and England would unite in supplying a loan of $100,000,000 to Belgium, each power contributing one-half. Extremely painful stories of misery and destitution come from Belgium, where many small villages have been destroyed, the men killed or taken captive, and the women and children left destitute and without shelter. The forts at Liege were still holding out, August 26, and were reported to be hampering the Germans in building pontoon bridges across the Meuse. The forts at Namur, reported fallen, were holding out, August 27, and Belgians were holding back the Germans at Malines.....August 23 it was announced that Austria had ceased operations in Servia, the Austrians now uniting their effective forces with Germany against Russia. Austrian losses have been heavy in Servia. August 25 Austria declared war on Japan. It was stated that fortifications at Cattaro, an Austrian port on the Dalmatian Coast, had been destroyed by French-British bombardment..... The Russian advance in Eastern Prussia continued, August 18-27, heavy German losses being reported. The Russians then occupied a strip of German territory 50 miles wide, their front extending 130 miles. August 27 the Germans near the Vistula River were reported in retreat westward.....The British Admiralty stated, August 22, that about seven per cent. of the total German merchant marine is now in British hands, while another 30 per cent. is sheltered in harbors and unable to get out.....August 24, after dark, a Zeppelin airship dropped bombs into the city of Antwerp, destroying a number of houses, one of which was only 300 yards from the palace of King Albert. Seven persons were killed. One bomb fell in a hospital. The airship was brought down by Belgian artillery fire six miles outside of Antwerp..... August 26 Americans were warned to leave Italy by the American Embassy, as the country was then mobilizing troops and it was feared that Italian neutrality would be abandoned.....August 23 Japan declared war against Germany, and August 24 began the bombardment of the German base at Tsing-tao. August 25 British ships shelled Tsing-tao, China, to locate the German batteries and cover the landing of the Japanese troops. Three thousand Russians have left Vladivostok to join in the assault. The Austrian cruisers attempted to run blockade from Tsing-tao harbor, but were driven back.

Make Your Barn Pay Real Profits

The Louden Way

Make your new barn a modern barn, even though it is small. It will cost you less and pay you more every day it stands, in labor saved and in more productive cows.

Louden Barn Equipments are the only really economical, sanitary and comfortable barn equipments, and are the greatest labor savers ever invented for the farm. Used all over the world by good business farmers and dairymen—by men who know what pays and why, and who will not pay a cent for mere frills.

USED ALSO IN MOST STATE AND U. S. GOVERNMENT STABLES WHERE ONLY THE BEST IS INSTALLED.

Simple in design, strong in construction, easy to install, outlast the barn, and their cost is so little that you cannot afford to do without them even if you have but few cows.

The Louden Line Consists of:
Louden Steel Stalls and Stanchions,
Louden Feed and Litter Carriers,
Louden Bird-proof Barn Door Hangers,
Louden Mangers and Manger Partitions,
Louden Maternity Pens, Bull Pens, Calf and Hog Pens,
Louden Alignment and Go-right Devices,
Louden Power Hoists, Hay Tools and many other labor savers and money makers for the barn and farm.

Illustrated catalog free on any of these equipments.

Our barn building experts are at your service. Send for free suggestions and preliminary sketches. Let us save you money and trouble in planning your new barn or remodeling your old one.

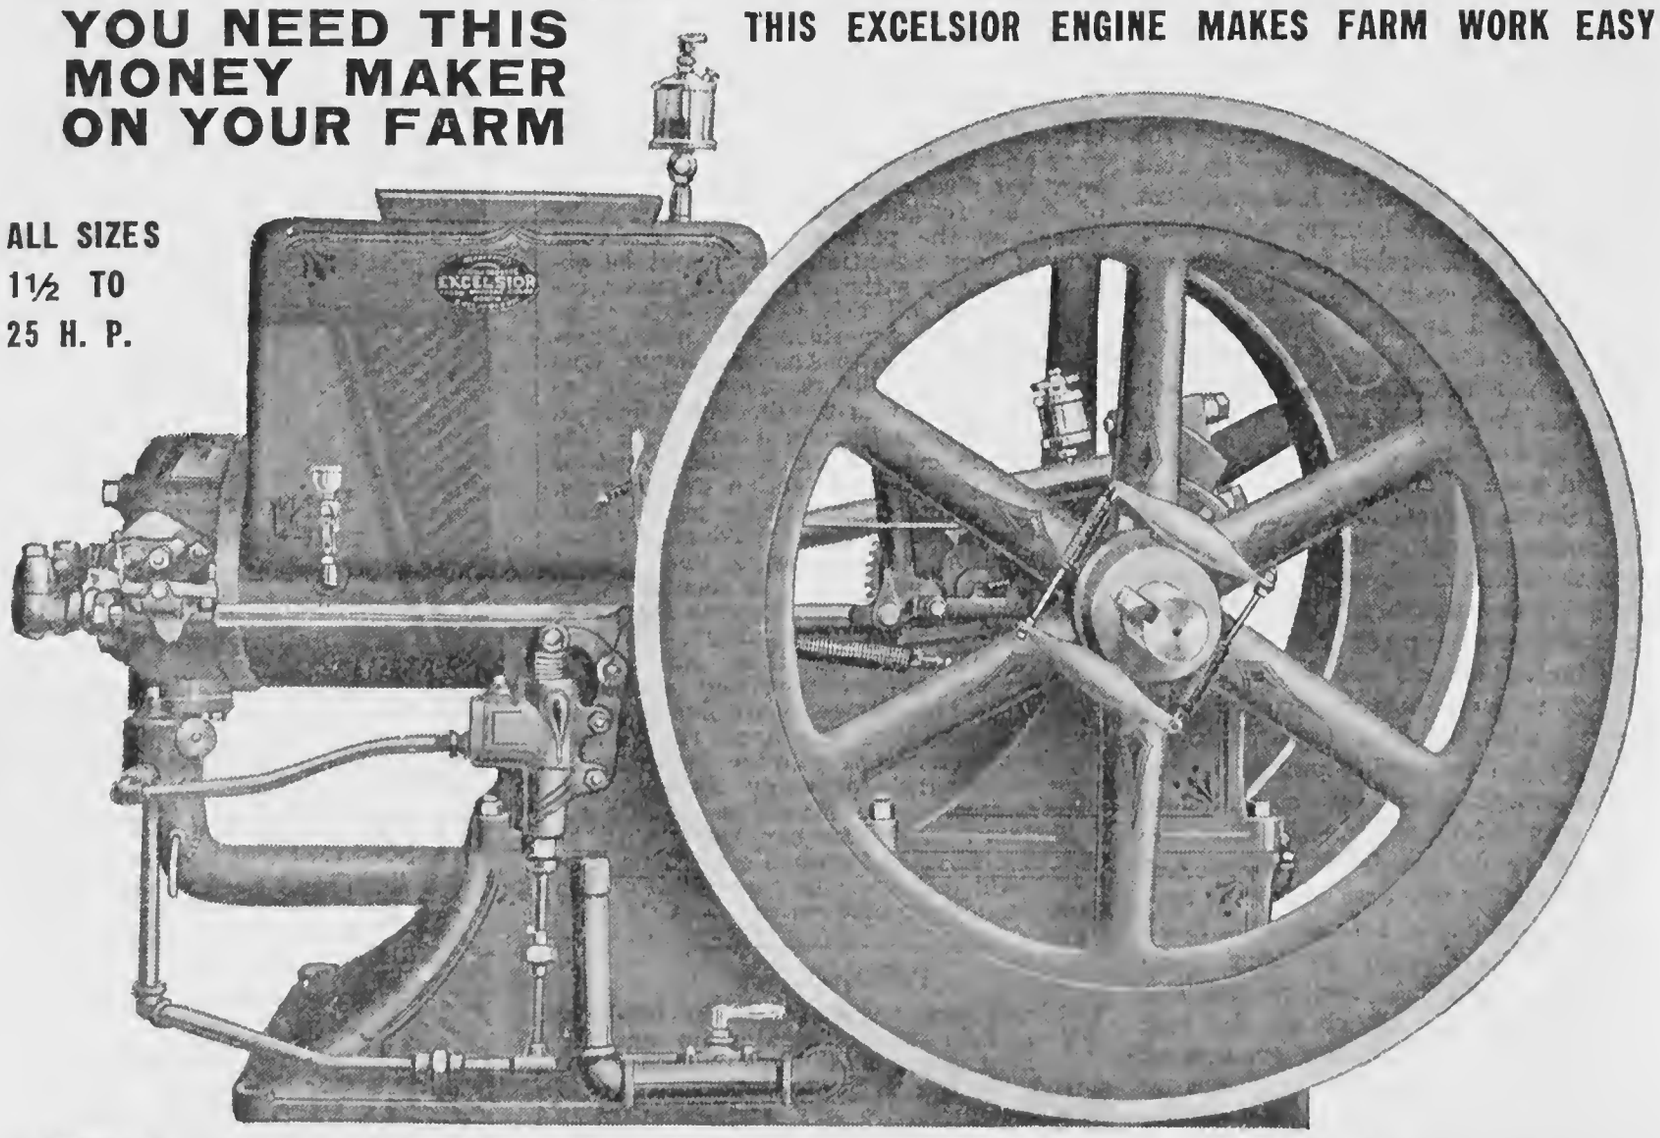
YOU NEED THIS MONEY MAKER ON YOUR FARM

THIS EXCELSIOR ENGINE MAKES FARM WORK EASY

ALL SIZES 1½ TO 25 H. P.



Said a customer, who was using an **EXCELSIOR** engine, "You should change the name **EXCELSIOR** to the **'ALWAYS READY'** or **'WILLING WORKER'.**" He said further, "I have owned five different makes of engines, but the first satisfactory engine I have ever owned is an **EXCELSIOR.** We start it in the morning and it keeps going until we stop it. We waste no time tinkering or adjusting. The men are not loafing around because the engine won't work. We do not have to go to town to have new parts made. In fact, we spend our time doing work now." This man's experience is that of thousands of others. Take a look at the **EXCELSIOR** above. Does it not show class all over—a husky, well built, reliable power, but you do not have to take our word for it! Order an **EXCELSIOR** subject to approval. After you get it, take a look at all the engines in your locality. Watch them run; then watch the **EXCELSIOR.** Inspect the workmanship, design, and material. If you do not find it the best engine you ever saw, put it on the cars and send it back to us; but do not delay. Send for information and catalog at once. We give a special proposition to the first buyer in each locality if they tell us the size engine they want, and when they want it; also size of farm.

R. CONSOLIDATED GASOLINE ENGINE CO., 202 Fulton St., NEW YORK CITY

BACTERIAL LEAF SPOT OF PEACH.

LAST Summer peach growers about Hammonton, N. J., complained that the foliage of their trees was being injured by some sort of a leaf-spot which finally caused the foliage to drop from the trees. The variety Elberta appeared to be affected more seriously than other varieties. This leaf-spot trouble began to appear again in June of the present year. Samples of the foliage were sent to Dr. M. T. Cook of the New Jersey Experiment Station, and he identified the disease as the bacterial leaf-spot of the peach.

BACTERIAL LEAF SPOT ON PEACHES.

This disease has been more or less common for some time in southern peach districts and has also been reported from Connecticut. It has undoubtedly occurred in New Jersey for some years, but never caused serious damage.

The disease first attacks the leaves upon the northwest side of the tree, gradually spreading to the southeast side and in severe cases causes almost complete defoliation. The fruit upon trees thus affected fails to mature properly and is a loss to the grower. In severe attacks the fruit is also affected and is distinguished from the disease known as peach scab by irregular cracks in the skin of the fruit.

Connett's Early was found to be seriously attacked both in leaf and fruit in one orchard. At Hammonton the most susceptible varieties are Elberta, Connett's, Carman, Reeves' Favorite, and Mountain Rose; while Belle of Georgia and Maule's Early appeared to be resistant. In the State Experiment Orchard at Vineland, Globe and Susquehanna have appeared to be susceptible varieties. As this is a bacterial disease there is no satisfactory remedy known for its control. In general it is seldom serious for more than a single season. It is evident, however, from the injury to the peach industry about Hammonton last season that further study of the disease is imperative and it is hoped that means will be provided so that the Department of Plant Pathology of the New Jersey Experiment Station may be able to carry out some investigations next year.

Canadian Fruit Report.

THE Dominion Department of Agriculture makes the following statement of crops:—

Quebec.—All varieties of apples more abundant than last year. Wealthy and Alexander, full crop. Fameuse and McIntosh 60 to 70%. Dry spell broken by rain on the 14th.

Okanagan Valley, B. C.—Dry weather ripening late peach crop three weeks earlier than last year—same applies to pears, plums and prunes. Plums very heavy. Bartlett pears, 100% increase over 1913. Apples 30% increase, and of high quality. Ideal weather.

Annapolis Valley, N. S.—Apple crop 80-90% clean, which is same percentage as spotted fruit in 1913. Crop increased 30% and fruit of larger size. Heavy drop in Baldwins and Ben Davis. Weather very favorable. Market very gloomy as buyers will not offer.

North-West States.—Increase over 1913 is 20%. Quality extra fine—60% "extra fancy." Markets uncertain.

New Brunswick.—Apple crop promises to be double that of 1913. Free from scab. Local markets good. Weather fine and dry.

Ontario—Georgian Bay.—Apple crop 60 to 70% full and exceptionally clean. Winter varieties in Barrie and Orillia (Lake Simcoe) district, less than 25% and Fall varieties 50%.

Norfolk.—Baldwins 80%, Greenings 50 per cent., Spies 40 per cent. Total apple crop 50 to 60 per cent of full crop. Dry weather not affecting size. Fruit generally clean.

Essex.—Recent rains ensure heavy crop of Fall fruits. Apple crop same as last year, fewer Baldwins but more Kings and Greenings. Peaches full crop. St. Johns ripening next week. Plums good. Pears heavy.

Lake Ontario (North).—Dry weather broken August 14. Apples clean in sprayed orchards. Early varieties ready to move. Buyers not operating. Ontario county fair to light. Northumberland heavier but undersized.

Wharton Valley in Otsego Co., N. Y., is a beautiful location. The farms in this valley are mostly owned by the people who inhabit them. Therefore more interest is taken. The buildings in most instances are kept well painted with large spacious lawns which are kept well mown and give an appearance of a village or city home. The crops are good in most cases; hay especially was of a very fine quality and a large crop. Most farmers cutting more than in previous years. The oat and corn crops are exceptionally good. Dairying is the principal occupation, the black and white cattle predominating, and many are running wholly to purebred. One of the largest bottling plants of the Borden Condensed Milk Co. is located at Edmeston, N. Y. where most of the farmers carry their milk. Much poultry is kept generally the White Leghorns. The eggs are mostly shipped to the city. One of the best organized and working Granges in the State is also located at Edmeston, N. Y. The meetings are regularly and largely attended. The degree work is exemplified by the young ladies of the Grange in a manner that does credit to themselves and the Grange. H. E.

Study This Car

This HUDSON Six-40 for 1915 is a car for every man to consider.

Howard E. Coffin, the great HUDSON engineer, offers this as the ideal Six. He has worked for four years on it—he and his staff of 47 expert designers. Since last year's model they have added 31 new features.

What such men call "Our finished Six" well deserves your study.

Over-Taxes Ended

This car marks the end of excess—in size and power, in price and weight, in upkeep and operative cost.

It is large enough. There is ample room for seven. It has power enough—47 horsepower—for any possible requirement.

It weighs 2,890 pounds. Cars of this capacity, built in cruder ways, used to weigh around 4,000 pounds. By better materials and better designing we have saved that needless over-weight—that heavy tax on tires. Yet there never was a sturdier car.

A new-type motor reduces fuel cost about 30 per cent. The new price—$1,550—is by far the lowest ever quoted on a high-grade car.

These things mean enormous savings. They mean that men no longer need to suffer over-tax.

New Attractions

The HUDSON Six-40 embodies these savings in one of the handsomest cars ever built. Every line and detail shows the final touch.

There are many new ideas in equipment. There are comforts and conveniences found in no other car as yet. A study of this car will reveal sources of attractions which you haven't seen before.

All for $1,550

In the new HUDSON you get all these new features. You get them in the highest type of a quality car—one of the finest examples of new-day engineering. And this year's price is $1,550, f. o. b. Detroit. That's $200 less than last year, because of a trebled output.

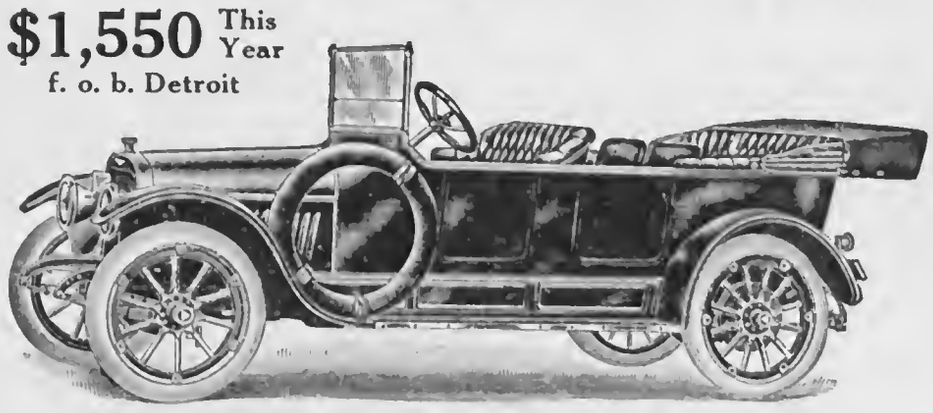
Go see what a car that price now buys. Measure it with other cars and prices. You cannot then go wrong.

Hudson dealers are everywhere.

New catalog on request.

HUDSON SIX-40 for 1915

$1,550 This Year
f. o. b. Detroit



A perfect streamline body.
Seating up to seven.
Disappearing tonneau seats.
Invisible hinges—hand-buffed leather upholstery.
Gasoline tank in dash. Tires carried ahead of front door.
"One-Man" top with quick-adjusting curtains attached.
Dimming searchlights.
Simplified electric starter.
Wiring in metal conduits.
Locked ignition and lights.
New speedometer drive.
Automatic spark advance.
New-method carburetion.
Phaeton or roadster.

Hudson Motor Car Company, 8143 Jefferson Ave., Detroit, Mich.

Hope Farm Notes

THE article on child labor is one all mothers are deeply interested in. I believe in the weekly allowance if paid regnlarly, but this I find if spent rapidly causes expensive habits. Now Mr. Philosopher, how can the boy be made to save a certain amount? I have tried several methods with indifferent success. E. W. S.

New York.

It will depend on the boy. Right in the same family I have seen natural spendthrifts, while their brothers and sisters were saving in habit. We started small bank accounts for our children when they were little things, and tried to explain how their money works for them and draws interest. They have all been quite willing to invest their money and see their account grow. Money which they earn means far more to them than any "allowance" or gift. When I lived in Colorado I met some "remittance men." These were second or third sons of well-bred English families. The first son seemed to inherit the estate and those others seemed to expect a regular "allowance" for their support. A more useless, lazy set of men I never saw. From boyhood they had been brought up to expect someone to pay them money regularly without any eqnivalent on their part. That was the "allowance" carried out to its final conclusion, and I have never believed in it. I would bring a child up to understand that he mnst give some return in labor or service for the money he receives.

There are two reasons why some people cannot start their children at a bank account. One is they never start one themselves, or at least do not make an effort to keep it up. Most children will do what their parents do, and if some of the family talk is abont fair saving for a wise purpose they will want to do like the rest. I do not mean talking about money as if it were the only desirable thing in the world, but a fair idea of economy and the need of saving. Sometimes a boy will want something badly. It is not a necessity but he sets his heart on it. I would tell him he must save the money for it—bank it until he has enough. If after he earns the money and banks it, he is still willing to buy the thing he had in mind he will most likely make a good investment. After the child gets a few dollars in the savings bank it may be a good plan to have him buy one or two shares in a local building and loan association. The demand for prompt monthly payments will give him good habits of meeting his bills, and the money will come back to him in a lump when he is ready for college or business.

I have observed one thing, however, which is quite true of human nature. No child is likely to start any bank account when he comes up with the idea that he does not need to do so. Once let him get the idea that father and mother have plenty, or that they think it degrading for him to work, and the chances are that you will be training a "remittance man" for life. Children of the rich can feel no particular incentive to save their money or bank it. Why should they? Put yourself in their place. Or take the case of a family where father and mother try hard to "keep up appearances" and imitate their rich neighbors. Who can expect their children to practice self-denial or see the need of saving? The best way I can think of to start a child is to let him understand early that all he can reasonably expect from you is good body and brain and home and education. Beyond that he must work his own way. I am sure that our children understand that fully.

HOPE FARM "SCRUBS."—They are still on deck at the laying contest, and doing far better than I ever expected. When they were entered I asked a number of good hen men how many eggs they would probably lay during the year. The average of these estimates was 75 eggs each. Up to August 14 they had averaged 106 and "still going strong." I fignred that they might possibly lay 950 by August 1. The actual record was 988. My estimate for September 1 is 1100! The record of the scrubs for July is given below:

HOPE FARM SCRUBS.

	May	June	July
No. 1	21	7	18
No. 2	22	19	21
No. 3	23	22	20
No. 4	21	10	18
No. 5	28	21	12
No. 6	25	19	15
No. 7	13	11	4
No. 8	19	18	10
No. 9	22	23	25
No. 10	19	19	22

Including the eggs laid on the floor and not credited to individual hens they laid 173 in July.

Of conrse I understand that a dozen henmen will start up at once and scoff at this record. They have hens which averaged 25 or more eggs in July. All I can do is to invite some of these gentlement to pnt 10 of these wonderful hens right into the egg-laying contest. With the fnllest confidence in what these men claim I have graduated into the "show me" class, and I want to see before giving them fnll credit. There are some fine pnre-blood hens in this contest. Snppose we see how the scrubs stood up to them in July:

JULY RECORD—10 HENS.

Hope Farm Scrubs	173
Best Plymouth Rock	188
Poorest Plymouth Rock	129
Average Plymouth Rock (13 pens)	154
Best Wyandotte	192
Poorest Wyandotte	93
Average Wyandotte (10 pens)	140
Best R. I. Red	188
Poorest R. I. Red	103
Average R. I. Red (15 pens)	137
Best Leghorn	250
Poorest Leghorn	90
Average Leghorn (34 pens)	187
Average all pens (82)	163

The Orpingtons averaged 105 and the Campines 149. There are four other pens called "hens." These averaged 138. The "scrubs" beat seven pens of the Leghorns. Of the 48 pens outside of the Leghorns the "scrubs" beat 43 pens! I am well satisfied with this record, in fact I would not complain if the scrnbs were tail-enders. That No. 7 is a poor performer, and she is the one I picked as the best of the lot at that. She started in to molt the first week in August, but thonght better of it and came back with two eggs during the second week. I find no fault with any of them. It appears that if they could have started with the others they would now be higher up. They were a hard-looking lot of birds when they entered. Most of them had hard colds, and seven of them had received no training whatever for such a contest. The old complaint that these birds are not "scrubs" now comes np again. I thought that in buying them as I did in the live poultry market I should surely get cast off or rejected hens which were considered not worth keeping. However, these birds were so poor that before they started laying most of the experts hooted at them and wondered why they were ever selected. It was not until these "scrubs" began climbing over a lot of the pure-bloods that we heard any complaint. I think they represent the type of hen to be found on the majority of our farms. They will certainly show whether the introdnction of purebred blood will pay. H. W. C.

FOUR-YEAR-OLD Josephine was greatly pleased to have a garden bed of her own, and worked faithfully planting and weeding. One day she ran in and annonnced triumphantly: "O, muvvy, my onions have got they little tails stickin' up!"—Woman's Journal.

100 LBS. UNION CARBIDE IN GRAY DRUMS WITH BLUE BANDS

Use HOME MADE ACETYLENE to *light* your House and Barns to *cook* your Meals

You can pick out an acetylene lighted farm as far as you can see it. The light streaming from the windows will be white and indescribably beautiful—the big ronnd lights in the barns will be wonderfully brilliant. Go in and look them over at close range. You will, in most cases, find all the "fixtnres" eqnipped to light up with the pull of a slender chain—without matches—just like electric lights.

The cheerful housewife in every one of these acetylene lighted homes will tell you that her lights have banished forever the gloom of kerosene lamps, and all the labor and drudgery their use entailed. She will tell you also of the delights of cooking on an acetylene range in a cool kitchen—with no bother of kindling, coal, ashes or soot. There are now no less than a quarter of a million families using home-made acetylene for both lighting and cooking. In every case the gas producing stone — UNION CARBIDE — is ordered direct from the nearest of our warehouses, located all over the country. In the drums in which we ship UNION CARBIDE it is as safe to store and handle as common coal. It won't burn and can't explode. The little machines which automatically release the gas from the Carbide are called acetylene generators. The newer models are so wonderfully simple and perfectly reliable—they work with no attention other than filling once a month.

We will be glad to mail our advertising literature which we are sure you will find intensely interesting. Address

It's risky to buy merely a "Portland" Cement

To just say "Portland" means you might get cement good enough for some work but not good enough for *yours*, and the job that should last for ages might be entirely spoiled.

"Portland" is only a general word that stands for a certain *class* of cement. It does not describe the *quality*. Cement, like leather or lumber, is fair, better or very select. The United States Government, in Farmers' Bulletin 481, says, "Many brands of Portland Cement are on the market, and the farmer should select a well-known make *guaranteed* to meet the standard of the United States Government."

ALPHA THE GUARANTEED PORTLAND **CEMENT**

is warranted to more than meet this standard. The government has purchased hundreds of thousands of barrels of ALPHA for use in important forts, piers, sea walls, etc.

In building for all time you ought to have the best Portland Cement that is made. Use ALPHA, the ***guaranteed*** brand. When you see ALPHA on a bag you can be sure that every ounce of the cement is thoroughly burned, finely ground, correctly aged—that every ounce is live and full of binding power.

Some dealers will offer "just as good" cements, but we will see that you can get ALPHA, the kind that you may be sure of at all times.

25-Cent Farm Building Book Sent FREE

Ruralisms

UP-TO-DATE POINTS IN GARDENING.

MULCHING.—In late cabbage setting time it was quite dry, and those who did not take special precautions lost a large part of the plants put out. One gardener (a man from West Virginia) took a novel way of insuring dampness. After the ground was marked one way he distributed rotten manure from the hotbeds along the marks about a foot wide and three inches deep. This was two weeks previous to planting. In planting a line was stretched across the rows and the plants set with a dibble after opening a small place in the manure. The ground was damp and in good condition, and not a plant died. In a few days the manure between the plants was collected around them with a rake and the cultivating and hoeing buried most of it in the soil. Others imitated this man and where rotted manure was not available, manure fresh from the stables was used with equally good results. In another instance a gardener, after sowing turnips where early potatoes had been grown, scattered litter from the stable thinly over the surface, and this conserved moisture enough so the turnips started while his neighbor's sowing grew only in spots accidently moist. Near Cleveland is a section where gardeners are very successfully growing celery as a second crop after early peas upon upland gravelly soil. After planting they mulch with fine stable manure where shavings were used for bedding, to the depth of two inches and then water thoroughly with a hose under pressure. The result is that the celery starts at once and makes rapid growth. The celery is planted close, the plants being set at six inches in rows 26 inches apart. Boards or paper are used in blanching, and this season some will try the new patented tubes which are sprung around the plant and retain their place without tieing.

TRANSPLANTING.—This Spring I had a quantity of onions to transplant, and when the time came to do it the plot of ground was quite dry, with no sign of rain. It was near the greenhouse where I could get an abundance of water by turning a stop, and so after raking the ground nicely one evening I watered it at the rate of three gallons per square yard, putting it on with a sprinkling can and going over several times so as to permit the water to soak in. The next morning was cloudy, and I set the plants in ground that was moist clear down. Disturbing the ground in transplanting prevented baking, and a rain coming the next day not a plant died. A friend who is very successful in growing early tomatoes and melons told me how he got a quick and vigorous growth on newly set plants which are started in pots or dirt bands. After the land is marked a man goes ahead and opens places with a light spade, one side of the opening being left smooth and nearly perpendicular. The plants are turned out and distributed, when the planter with a box of manure taken from a spare hotbed follows, dragging the box along with him. He takes a plant and presses it against the straight side of the hole, and then slaps a big handful of the rotted manure against the exposed side of the ball of roots. The loose earth thrown out with the spade is then gathered into the hole but not so much but there is left a slight depression.

CONSERVING MOISTURE.—If the ground is not moist a pint of water is given to each plant. The next day the plants are hoed, filling the depression, and the plants start at once into vigorous growth. By this method the roots which grow in a spiral when confined in a pot come in contact with both soil and manure, and the effects of too strong a dose of fertilizer is neutralized. In late or mid-summer transplanting I have found double transplanting a very good way to secure a good result. Probably most of my readers have had occasion to lay cabbage or sweet potato plants in the cellar to await the evening or next day for planting out. If these plants are in a close damp bunch it will be noticed that tiny white roots have formed all through the bunch. These are the feeding mouths for the plants and if placed in moist ground begin at once to carry on the growth arrested by digging up.

METHODS OF PROTECTION.—Plants vary greatly in their ability to recover in transplanting, succulent plants like onions and cabbage receiving little shock and set-back under favorable conditions, as they retain sufficient moisture in themselves to prevent excessive drying while the feeding rootlets are being renewed. To preserve the proper conditions in the heat of Summer is necessary, and various methods are used and have been for centuries, such as covering with dock leaves or straw, or sticking green boughs beside them. In home gardens I have often seen boards propped up over celery rows. Now double transplanting enables one to carry plants by the first shock of removal more easily and with more certainty than any other way. The plants are planted as close as may be convenient in short rows a few inches apart, kept thoroughly watered and shaded with something which may be removed toward night and replaced late in the morning. The result is that the roots commence growth at once, and soon bind to themselves a mass of earth which stays by and nourishes the plant when finally planted out a few days later. The saving comes in the fact that the watering and shading can all be done in a very small space, and where the wants of the plants can be attended to without ranging over a wide field. At this writing I am using exactly this plan in putting out a new strawberry bed. The plants are dug from the spaces between rows, and replanted in the garden in close rows, where they will be encouraged by shading and watering to an immediate new growth, and along toward September the plants will be removed to a permanent bed. It makes but little difference how old the plants are, as I know by experiment that old plants will renew their youth and produce next year. As the plants will make no increase I set in triple rows six inches each way at intervals of five feet, expecting to clean out and allow them to spread after fruiting.

Northern Ohio. L. B. PIERCE.

Loganberry in New York.

IS the Loganberry successfully or profitably grown anywhere as a market berry? We have two plants, fruiting this year, and we are wondering whether we want any more. E. J. L.

Westchester Co., N. Y.

General reports indicate that about half a dozen Loganberry plants would be the limit for your latitude. This berry is a success on the Pacific Coast and does well on the South Atlantic, but it does not seem suited to our northern sections.

Color Cards of Handsome Homes

If you're thinking of painting, now or a little later, you'll find it easy to decide on colors, from these pictures of *actual houses*. When it comes to buying the paint, you insure good results and economy, if you decide on

Lowe Brothers High Standard LIQUID-PAINT

There's only one way to judge paint—that's by the way it stands the weather. "High Standard" paint is based on over 30 years of outdoor exposure tests. The ingredients are selected by painstaking chemical tests and combined by the latest of machinery. There is *no guess-work* about our paint. It *will* brush freely and easily, over a liberal amount of surface, and prove economical in the beginning. More important still, it will *hold fast* to the wood in perfectly protecting coats, keep its color, withstand the weather for years, fail only by gradual wear, and leave a good surface for repainting.

Send for Free Books and Color Cards

When you paint, you want the most *beautiful* results to be had. You'll get many good ideas from our book, *"Homes Attractive"* and the *Portfolio of Color Plates* that we'll send you free.

It will also pay you to know just how we make and test High Standard Liquid Paint, as told in *"Paint and Painting."* Write today and ask name of nearest dealer in High Standard Paints, Mellotone, Varnishes, Enamels if you don't know him.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

NOW comes the season for proving the nurseryman—running his trees through a Babcock test! Some of them will come into bearing this year. A very large proportion will be true to name, but there will be "misfits" or cases where the label does not fit the tree. Then there may be older trees which we want to identify. The way to be absolutely sure about these things is to send a fair sample of fruit to the United States Pomologist, Department of Agriculture, Washington, D. C. This official makes it his business to identify and name fruits. He has laboratory, models, pictures and books complete, and his word will be final. He will, on application, send you boxes in which your fruit will be mailed free of charge. Our advice is to go direct to headquarters with your samples. We make use of this service and find it true.

*

WILL not the European War cause a shortage in next year's grain crop in Europe? If so would you not advise American farmers to turn over every acre they can this Fall and put in Fall grain crops? I. N. B.

No one can tell how long the war will last. It may be all over by Thanksgiving, or it may last a year or more. Thus far the fighting has not seriously interfered with the harvests. The grain in both Germany and France has been cut by women and old men, and the same workers will put in a new crop as best they can. There will be a shortage, of course, and Europe must look to Africa, Australia, South America and this country for part of its food. It is not likely that the English grain crops will be smaller. They may be larger. To the second question, as it is put, we answer No! It will never pay to turn over old or unsuitable land, give it a hasty fitting and then sow grain just for the sake of obtaining a large acreage. The thing to do is to increase the grain acreage a little, and work the land just as well as you possibly can before putting in the seed. Try to grow more grain to the acre rather than to scratch over more acres. Time spent in war talk at the village store raises no wheat. The same time spent in one extra harrowing will mean more grain, and Europe will need every bushel of it.

*

IT is maddening to think a handful of individuals can set all Europe at each other's throats. It is also intensely irritating to realize how much we here are at the mercy of a comparatively few commercial autocrats of the brigand type, men who produce nothing, who render no service except that which could be better given at much less cost in other ways, and yet who exact in toll twice the value of the product as it leaves the farm of the producer.

This from the Bristol (Conn.) *Press* expresses the opinion of millions of our people in the Eastern States. With the largest crops on record, and Europe shut off from export trade, a gang of food pirates proceeded to boost the price of flour, sugar, meat and other necessities. No one thinks of claiming that farmers gained a penny by this rise in the price of necessities. They lost money as a whole, for the robbery of the public, through these hold-up prices, injured the trade in fruit, vegetables and similar goods. The Government is trying to probe into this outrage and find the rascals who are responsible for it. Each time this bold robbery is attempted we become more and more convinced that the Government must step in and protect the people by regulating prices. Through the Interstate Commerce Commission it regulates the price of transportation of freight and passenger traffic on the railroads. The price of food is of far more importance than the price of transportation. A commission with power to investigate and fairly regulate food prices to consumers would quickly prove that the 35-cent dollar is a reality and it would shut off the food sharks and useless middlemen through its exposures. Can anyone give a sound reason why such a commission should not be created?

ON page 1032 we printed a statement from an insurance company regarding an accident to a farm laborer. After accepting a premium to cover such insurance the company appeared to argue that it was not liable because the new law exempts farm laborers. One of our readers makes this point:

I carry a compensation policy on my farm labor, and as I understand the point in question, while the law does not compel a farmer to carry compensation insurance on his labor, at the same time there is a rate issued for same, and anyone who wishes can voluntarily place his employees under this protection, and that any insurance company accepting his premium for same is bound to pay in case of an accident on the same basis as would be paid on other classes of employees on which the law demands insurance.

That seems to be common sense no matter what the law may be. If the insurance company agrees to pay in case of accident to a man the agreement ought to be kept regardless of the exemption in this new law.

*

I HAVE seen a good many "hen stories" in THE R. N.-Y., and I know many claim that $1 per hen per year is about the best you can expect. What would they say of making $1,000 a year from 50 hens? We have a man here who wants to wager $100 that he can make $1,000 per year from 50 hens. If this wager could be made and successfully carried out, wouldn't it be a great "eye opener" to the poultry business? This man stands ready, so he says, to place the $100, and cost of supervision to fall on the one who loses. S. J. V.

Vermont.

We must not let this egg-laying contest run away with us. The air is full of these propositions. One man offers to bet $1,000 that 10 of his hens can outlay any other 10 in the country. When this gentleman is asked to get into the next poultry contest he makes it clear that his $1,000 is hung up on the home henhouse—not in public! We have had several propositions like the one mentioned by S. J. V. Usually the plan is to take a flock of high-class hens and feed and keep their record at home. It is expected that the advertising gained through public announcements of the contest will develop a high price for hatching eggs and baby chicks. Such a trial would not represent the conditions under which the average henkeeper must work, and would really do more harm than good to the general poultry business. It would develop into another "big story," and every man with a "system" or some other scheme for making a hen lay golden eggs would use it as "sucker bait." We have one reply to these poultry bluffers—"*Get into an egg-laying contest!*" Let such a man select 10 hens which he will bank on and enter them on even terms with the other pens. He may be the most honorable person on earth, but the public will never accept his word for a record as it will an official statement from one of the regular contests. It will, of course, be answered that the official contest does not give the hen *man* a chance to show his skill as a feeder and seller. That is true, but the public cannot buy skill and business ability in eggs and stock. The foundation of success in the poultry business must ever be the *hen*. If a man will prove by the official figures that his hens are what he claims for them the public will be likely to accept his other statements.

*

THE Board of Trade of Gainesville, Florida, is doing great work in trying to head off the land swindlers. A letter is being sent to the papers which starts off as follows:

In a few weeks the fake land companies who advertised five, 10 and 20-acre get-rich-quick tracts of Florida lands will begin sending their people down. These swindling concerns usually start their advertising and circular work in the Fall of the year, just about the time the Northern and Eastern crops begin to move. Every class of people is caught in this systematized dragnet that is thrown out by unscrupulous individuals operating under the name of land companies. Countless thousands of small wage earners, men and women, have been induced to buy acreage in our State, believing that they have only to move down, plant themselves in a portable bungalow, and sit under the shade of a live oak tree while watching the soil produce a stream of golden dollars. It is both a pity and a shame that these Northern syndicates have been permitted to rob a class of people who can least afford to separate themselves from their savings.

F. M. Runnells, the secretary of this Board of Trade, says Florida people are constantly being called upon to take care of families who have bought small patches of land, and who found themselves cheated and abandoned.

These people have our greatest compassion and our people cheerfully contribute to their relief, but always with a feeling of outrage that these unsuspecting men and women have had such unfair advantage taken of them. Florida is a land of golden sunshine and promise, but, as in every State in the Union, it takes brains and some capital to get results.

We have long claimed that the people of Florida are the ones to rise up and smite these land sharks. None can do it more effectually, and none can be more interested because these land frauds do great injustice to Florida and her people. We have for years fought and denounced these land schemes almost alone among Northern papers. Some of our Florida friends have grieved because we drove the knife into these fakes without reserve. We had to. There was no other way when the honest people of Florida did not take effective steps to shut off and punish the land liars who will steal a man's home. Now the Florida people are awake, and they can do effective work.

*

LAST week a woman told of her "table on wheels." She can wheel this table close to or into the kitchen, put the food on it, and then wheel the entire thing to her dining room. Formerly she made probably 50 trips; walking perhaps one-fifth of a mile to carry the food and the dishes back and forth. Similar contrivances can be thought out on many a farm by which crude labor is saved. There may have been times in the past when crude labor seemed hardly worth saving. That time has now gone. We have come to a time when about the only profit comes through saving labor. The man who can do this is called "efficient."

*

OUT in the Dakotas the agricultural teachers as well as the thinking farmers, are advocating live stock and dairy farming to take the place of grain growing. Among other arguments the following is presented by Prof. C. Larson. He says it will cost a day's wages for man or team to haul a load of grain or hay to the railroad. The freight to Chicago will be $3.40 per ton for grain and $4 for hay.

During the Winter months a dairy cow will eat about three tons of hay and one ton of grain. To get this feed for one cow from the farm to Chicago market costs:

Hauling from farm to shipping point, three loads of hay, at $4 per load	$12.00
Hauling from farm to shipping point, one load of grain	4.00
Freight on three tons of hay from shipping point to Chicago at 20c. per cwt.	12.00
Freight on one ton of grain from shipping point to Chicago at 17c. per cwt.	3.40
Total	$31.40

A fairly good dairy cow is able to change this feed into 300 pounds of butter. Shipping 300 pounds of butter to Chicago costs about $1.35. Adding $2 for hauling, makes a total cost of $3.35. The dairy cow has reduced the cost of marketing from $31.40 to $3.35, or to about one-ninth as much.

Putting the thing in this forcible way makes a strong mental picture for the average farmer. Why should he work to provide freight for the railroads, when the cow will stand as a machine to give him a home factory? If he says that dairying is too confining there are beef cattle, sheep and hogs to consume the feed at home and do most of the work of taking care of themselves. Take it any way you will, live stock offers these farmers a chance to be more independent. In addition to this is the fact that the plant food in the hay and grain is kept at home, where it is needed, when these crops are fed to stock. The Dakota farmers have only to consider the history of Wisconsin's agriculture to see what the change from grain growing to dairying has done for a great State. The substitution of the cow for the grain sack has had more to do with Wisconsin prosperity than any other one thing.

BREVITIES.

POULTRY need shade—as sheep do.

CASES of club-foot disease on Brussels sprouts have been found.

WHEN beef and mutton climb up the scale of prices Mrs. Business Hen becomes a great farm companion.

THE high cost of meat should teach us not to worry off our own flesh. It will cost too much to put it back.

THIS thing is older than the hills, if you, sir, only knew it; the way to go and do anything is just to go and do it.

"DON'T rock the boat," they tell us. Good advice, but a few solid rocks in the bottom of the boat as ballast will steady it.

THE man who would try to "stovepipe" apples or work off poor stock this year ought to go to an asylum—in addition to jail!

WHEN a man, knowing nothing of farming, takes a farm and expects to get rich quick the lines of his territory enclose a graveyard of big schemes.

SOY beans! They make great feed for the stock. We think it will pay better to feed them dry with corn silage rather than put them into the silo.

THE best time to cut corn into the silo is when the ears are "glazed." That means when the kernels are firm and solid, with a glazed covering, but not dry and hard.

THE value of grindstones produced last year in the United States was $855,627—which was $60,712 less than the year before. Have you met fewer people "with an ax to grind?"

AMONG other things increased in expense by the European War is cost of educational institutions in this country. Scientific instruments and chemicals are mostly imported.

WE think it pays to let all farm animals have access to powdered charcoal. They will usually eat it freely. Most of the so-called stock foods contain charcoal as one of the most useful ingredients.

ORGANIZING THE LAND BANK.

THE preparations for the organization of the Land Bank of the State of New York are progressing rapidly. Thirty-five of the local associations have applied for membership, bringing resources of over $25,000,000. The requirements of the law for organizing the Land Bank have now been completed, but it is short a part of the capital necessary to be subscribed before the bank may begin business. This is, however, being subscribed and those locations which wish to become charter members in the Bank, and help elect directors and complete the working organization should send in their applications at once. The sub-committee are now preparing draft of by-laws, and the organization will probably become a reality within a few weeks. It will then be ready to do business as soon as the full limit of $100,000 capital has been subscribed. It is not at all necessary that farmers have separate local associations from the towns and cities. They may associate themselves with associations already existing, or associate with town and city people in the organization of new associations. Of course, where no opportunity exists for such association farmers may organize local associations among themselves. The Jewish farmers at Centreville, Sullivan County, have already so organized. The Rural Savings and Loan Association has been organized by THE R. N.-Y. force and is now ready for business, and charter membership in the Land Bank. Shares in this association may be subscribed by any person, male or female, and they share in all the benefits, except that loans on mortgages are restricted by law to 50 miles from the office. Loans on the stock of the Company may, however, be made to members, wherever located. Installment shares may be taken on which 50 cents a share is paid in monthly until the accumulations with dividends amount to $100. This usually takes about 12 years and the amount paid in amounts to about $70. The dividends amount to the balance. Savings shares may also be selected. On these the member may begin with $1 or more and pay in more or less from time to time as suits his convenience until the sums paid and the dividends on same amount to $100.

Income shares are still another choice. In these the member pays in $100 for each share and his dividends are paid in cash semi-annually. Any of the shares may be withdrawn at any time on due notice.

Our hope is to see one of these associations in every neighborhood of the State. The State is ready to send instructors to explain the system, and to organize the associations if one is desired, and the Banking Department believes it has the requisite elements of success. We should be glad to have farmers become members of the Rural Association, with a view to becoming familiar with the system and then organizing in their own neighborhood and transferring membership to their own location.

It is hoped that the Granges and local farmers' clubs will take up this work; and organize associations. There is no possibility of loss, and great promise of gain to all. Intelligent and progressive business and professional men in every community will encourage these associations, because they realize that anything that improves the conditions of a neighborhood, helps them. Local banks also find them the source of increased business for themselves. THE R. N.-Y. will gladly coöperate with any community which is desirous of forming a local association of this Land Bank of the State of New York.

THE WAR AND COMMERCE.

WHEAT speculation has been active, December delivery now being 25 cents above the low mark in mid-July. Cash wheat advanced 10 to 12 cents during the week and held most of this rise. England and France are heavy buyers of oats, which are five cents higher than last week. Orders are far in excess of available supplies. Flour is 25 to 50 cents per barrel higher, the domestic as well as foreign demand being heavy. In some sections millers report that they are unable to get wheat, as the farmers are holding for $2 per bushel. Householders here have been buying flour considerably in excess of present needs, thus helping raise the price.

Tin has advanced from 30 to 65 cents per pound, and the scarcity of tin plate is so serious that many canners will evidently have to use glass or lesser their output. The high price of sugar is another hit at the fruit canners. Sugar has dropped one-fourth to one-half cent in some sections, but is still upwards of seven cents wholesale. Our exports of sugar during three weeks of August were 70,000,000 pounds, nearly 40 times the amount exported in July. Sugar is now retailing in Great Britain at the same price charged here.

Chemicals used in photography are all higher, as most of them come from Germany. The greatest rise is in the developing agent hydrochinon, which in two weeks went from 90 cents to $15 per pound. Germany has sold us $125,000 worth of arsenic yearly and England about the same amount. The industry will doubtless be developed here now.

The rubber trust is out with an elaborate explanation of increase in price of their wares. Rubber is not grown in the war zone of Europe, but it is claimed that the crude material is financed and transported by Germany and England. One excuse will be as satisfactory as another to consumers of galoshes and rubber coats when they hand out their 25 or 50 per cent. addition to the normal price.

Glass for window, plate and optical purposes is expected to be considerably higher. Belgium, France and Germany have been large sources of supply.

Gremany's exports to the United States have run about $190,000,000 per year. The largest item is cotton manufactures $16,000,000. Next in order are: Chemicals, $15,500,000; iron and steel, $12,800,000; fertilizers, $11,430,000; paper manufactures, $10,300,000; furs and skins, $8,300,000; hides, $7,650,000; toys, $6,870,000; wool manufactures $4,250,000.

In a full crop year, Europe takes about 4,000,000 barrels of our apples, three-fourths of them going to England, and Germany handling 15 per cent. England may use half the quantity ordinarily sent there, but it seems probable that 2,500,000 barrels which we expected Europe to take will have to be used at home or go elsewhere. This will be a poor year to market culls or "stovepiped" or poorly packed apples.

New York State News.

FORESTRY COLLEGE PROFESSORS.—Prof. J. F. Baker and Dr. C. C. Adams are the two new forestry college professors to be added to the faculty of the State College of Forestry at Syracuse. The former will be given the title of Director of Forest Experimental work and the latter will teach Forest Zoology. Prof. Baker, who is a brother of Dean Baker of the college, has spent the last 15 months in the University of Munich studying methods of reforestation.

CREAMERIES TO TEST LAW.—Does a milk collecting station have to give its men one day a week off, under the new law, is the question that the Sheffield Farms-Slawson-Decker Co. is seeking to find out through the courts. The section of the law that is in dispute says in effect that an employer, under certain conditions, must give each employe 22 consecutive hours off each seven days. Certain establishments to which this section shall apply are enumerated in the Act, but the milk company claims that it is not included in that list. Complaint has been filed at Pawling, Dutchess County, and as there are a number of such establishments in the State this case is looked upon as a test case as to the application of this section of the law.

WAYNE CO. APPLE GROWERS.—A branch of the Eastern Fruit and Product Exchange has just been formed at Sodus, in Wayne County, an organization of growers affiliating with the North American Fruit Exchange of New York. This association cuts out the middleman and places the fruit direct after the manner of the California fruit exchange. Wayne growers are not elated over the outlook for the export apple trade this year. With a bumper crop on the trees, rated at 75 per cent of a crop as compared with a 54 per cent last year, a serious problem seems to be confronting State apple growers.

CO-OPERATIVE ASSOCIATION.—A meeting was held in Grange Hall at Potsdam, this week, which was attended by about 40 farmers, to discuss the organization of a co-operative society under the State law. The meeting was addressed by Mr. Cole of Albany. After the discussion it was decided to organize for the marketing of milk products and the purchase of supplies. The capital stock will be $2000, of which $500 was raised at the meeting.

FARM BOYS' CAMP.—Commissioner Huson has made his selection of farm boys for the camp at the State Fair, and there will be 86 of them. One from each of the agricultural counties is selected on the recommendation of the Pomona Grange master of the county. They will be under the military supervision of Adjutant General Hamilton, and Dean Baker of Syracuse will have charge of their instruction. The boys will be uniformed in khaki.

NEW FAIR IDEA.—It has been left for the Cambridge Fair people to introduce a new feature into their fair attractions. They have arranged with the Granges for marching teams of from 10 to 20 young persons who are to contest for honors before the grand stand to see which can give the best 15 minutes' drill and march. One team will drill on each day of the fair. The prizes are $300.

A PREDICTION.—Commissioner Carlisle of the State Highway Department was one of the speakers at the Ontario County Grange picnic at Geneva. He made the prediction that within 10 years the horse would be completely superseded on the highways by motor-propelled vehicles, and that within that time a satisfactory car will be built which can be sold for $200 or $300, so that practically every farmer can own one. This growth must be taken into consideration in the building of our highways. The Commissioner also made this significant confession.. "I have had more trouble with the kind of politics which endeavors to get a road built past a certain man's place, just because he has a political pull, than anything else."

ABOUT THE FRUIT TRAIN.—The New York Central's apple car special started at Marlborough on schedule time, and about 150 growers visited it. They were specially interested in the operations of the apple grading machine which was operated by a small gas engine. The new grading law was discussed, and Mr. Van Buren of the Department stated that the law would be enforced and yet ample leeway will be given for any misunderstandings or lack of understanding of the law on the part of growers. Notices will first be sent to those not observing it, and they will be closely watched. Prof. H. B. Knapp spoke on marketing, showing the prices that different varieties had brought through a series of years, and recommended the varieties it would pay best to put in storage. Mr. F. S. Welsh of the Central talked on the car supply and showed that for the period from Nov. 1, 1912 to March 31, 1913, 7½ per cent. of the cars ordered were cancelled before being placed, and that this, with the detention of cars while loading, caused a serious reduction in the available car supply. Between Marlborough and Albany about 700 growers and others visited the car. J. W. D.

Government Crop Report.

IN the Atlantic States from Virginia northward, drought persists in Virginia and has extended into Maryland, causing all crops to deteriorate. Over the remaining portions of this district the weather is favorable, and crops made satisfactory progress.

Over the mountainand plateau districts, including the great range country of the Southwest, the weather is mostly favorable. Pastures and forage crops continue in good condition over the southern portions, and in the north the weather was generally favorable for harvesting.

Over the Pacific Coast States drought continues. In Washington and Oregon all growing crops are suffering, and water is getting scarce, but the weather is favorable for harvesting and thrashing. In California, water continues plentiful.

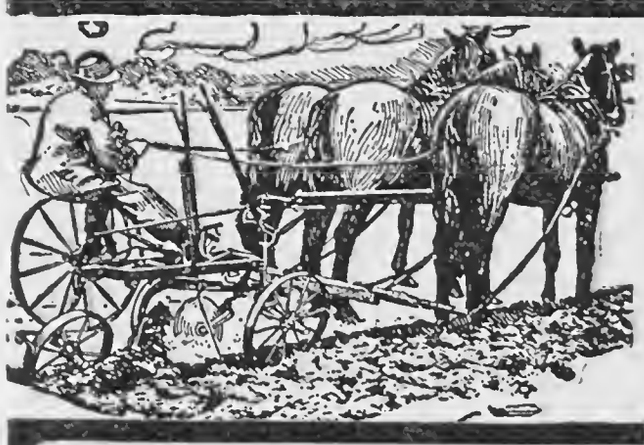
Nearly continuous high temperatures over the central and northern districts to the eastward of the Rocky Mountains, with beneficial rains over the cotton region and continued drought in portions of the western corn belt, were marked features of the weather of the past week. In the corn belt to the west of the Mississippi drought prevails in Iowa and portions of adjoining States, causing still further damage to corn and other late crops.

To the eastward of the Mississippi, except in the middle Atlantic States and over the South, favorable showers occurred and late corn and other crops were greatly benefited. Plowing for wheat is in progress over much of the country to eastward of the Mississippi, with the soil in good condition.

To westward of the Mississippi plowing is proceeding to some extent, but the ground is too dry for satisfactory progress. In this section water is becoming scarce, especially in Iowa, and pastures are badly in need of rain.

In the Spring wheat belt harvest is nearing completion, and the weather continues favorable for thrashing. General showers improved pastures and benefited corn and other late crops.

Lightest Draft—Easiest Handled



Wherever foot lift plows are used the Emerson leads for lightness of draft, ease of handling and length of service. The

Emerson Foot Lift Plow

is the *lightest draft* plow made and the most durable. Load is close to the team and carried on the wheels. A boy can easily operate the Emerson.

The Emerson Foot Lift Feature Made a New Era in Plowing Efficiency

Send for free book telling you how your feet handle the plow, leaving your hands free to manage the team.

Lime Doubles Crops Costs But Little Crushed With

WHEELING LIME STONE CRUSHER
"BUILT LIKE A BATTLESHIP"

READ WHAT EXPERTS SAY

Chas. E. Thorne, Director Ohio Agri. Exp. Sta. writes: "We find it necessary to use either burnt lime or gronnd limestone before either manure or fertilizing materials will produce a full crop."

Dr. Cyril G. Hopkins, Illinois Experiment Station, says: "The amount of limestone used in soil improvement in this state should be rapidly increased until it reaches more than a hundred times the present demand, for the reason that limestone is one of the necessary materials that must always be supplied for the highest improvement and permanent maintenance of Illinois soils, and also because that at reasonable prices for limestone and farm produce it can be used with great profit and justifies its application."

B. H. Hite, Chemist, W. Va. Agri. Exp. Sta.: "The effect of lime on worn out meadows and pastures is most encouraging."

Compare cost with burnt lime or any other soil food. Why pay $3 to $5 a ton when the rocks on your farm can be crushed for about one-tenth? A Wheeling Crusher will pay for itself grinding limestone for you—will make money working for neighbors—is adaptable to crush any size and you can add capacity as needed—two advantages you can't get in any other crusher. Steel-built—stronger than cast iron and lighter—runs on less power using your regular engine.

Learn ALL the advantages of owning a Wheeling and profits crushing for others—a business with a future greater than the threshing business. Ask for full information and

Woman and the Home

From Day to Day

THE NEUTRAL LANDS.

God's pity on the neutral lands
That had no wish to fight,
The little lands of fruitful peace
Now given to the blight.
The meeting ground of deadly hosts,
Their burning cities smoke,
Their trampled fields are drenched with blood,
Their streams with corpses choke.

God's pity on the women's hearts
That had no wish for war,
The women's hearts that bear all men
And bloody strife abhor.
Now they may only wait and fear
And weep the brave and true,
Each bursting shell must lay them waste,
Each sword must pierce them through.

—McLandburgh Wilson in the New York Sun.

*

THREE farm hands who received prizes for long service in the same employ at an agricultural show in Devonshire, England recently had each worked for one employer for over 46 years.

*

WELFARE workers in Liverpool, England, have started a plan for giving hard-working mothers a weekly half-day off. It is stated, with reason, that there are a great many difficulties in the way of the plan. Since the subject has been brought up, we wonder how many farm housewives take a weekly half-day off? Why shouldn't the household factory shut down long enough for mother to catch her breath?

*

EMBROIDERY cotton, the soft-finished sort, is just right for darning table linen, which is difficult to mend with twisted sewing cotton. The same kind of embroidery cotton is often a convenience for darning fine colored stockings; it is not always possible to match the fancy colors now worn with ordinary darning cotton. Another use for the soft twisted embroidery cotton is to make buttonholes in cotton or linen garments. One gets a better effect than with sewing cotton, and the work is more quickly done.

*

ROAST pigeons are prepared as follows: Select plump pigeons, pluck and draw. Rub the inside and outside lightly with salt and pepper. Make a stuffing of equal parts of chopped celery and bread crumbs, seasoned with a little minced onion and a pinch of powdered sage. Moisten this stuffing with milk and melted butter. Stuff the pigeons with teaspoonfuls of this mixture, dropped in lightly. Place a thin slice of fat bacon over the breast of each bird, securing it with a small metal or wooden skewer. Lay them in a buttered pan, breast upward, and roast in a moderate oven. Cook the giblets in a little salted water, chop fine and add to the drippings in the roasting pan. Thicken with flour and add water sufficient to make the gravy.

*

MOST of us have seen some of the elaborate old-time patchwork quilts which had cut-out patterns in colored calico applied on a white foundation. This style of work is now quite fashionable, not only for quilts, but also for cushions, table covers, curtains, etc. The designs, cut out, the raw edge turned under, are felled with tiny stitches to the foundation. Some put the work in an embroidery hoop, which enables one to hold it in position better, but this is not really necessary. Each separate piece of the design is cut out carefully. A cardboard pattern may be laid on the fabric, and then the outline marked in pencil; it should be cut a little larger, so as to give turning. Solid colored chambray is often used for the colored design. One elaborate piece of this applied patchwork was a pair of portieres of unbleached crash with a design of tall hollyhocks across the bottom, the flowers and buds being varying shades from pale pink to deep red. A wreath of ivy in different shades of green decorated a cushion, while another pretty design was a wreath of morning-glories, pink, blue and lavender. The materials for this work are very inexpensive, and yet it offers great possibilities if the work is neat and the maker displays good taste. We once saw a beautiful quilt, made before the Civil War, that was a fine example of applied patchwork; each block had a lattice basket of brown filled with pink tulips and their green foliage. The materials were colored calico on a white ground, and yet the accurate regularity of the design and the exquisite stitchery made it a work of art.

The Rural Patterns.

When ordering always give number and size of patterns desired. Price of each pattern 10 cents.

7820, Girl's dress in Russian style. Cut in sizes 10 to 12 years. Size 12 requires 3½ yards of 36 inch material with 1½ yards 27 inches for trimming. 8269, Girl's guimpe dress. Cut in sizes 4 to 8 years. Size 6 requires 2 yards of 27 or 36 inch material for dress, ⅞ yard 36 for guimpe, with ¼ yard 18 inches for yoke. 7479, Semi-princess dress for misses and

small women. Cut in sizes 16 and 18 years. Size 16 requires 4 yards of 36 or 44 inch material and ⅝ yard 18 inch wide for collar and cuffs. 7429, Girl's guimpe, with kimono sleeves. Cut in sizes 4 to 12 years. Size 18 requires 1 yard of 36 or 44 inch material with 1½ yards of banding. 7495, Girl's box plait dress. Cut in sizes 6 to 12 years. Size 8 requires 3 yards of 36 inch material with ⅜ yard of 27 inch for trimming.

8223, Plain guimpe. Cut in sizes 34 to 42 bust. Size 38 requires 1¼ yards of 27 or 36 inch material for guimpe without sleeves and 1¾ yards 36 inches with sleeves. 8288, Blouse with yoke and sleeves in one. Cut in sizes 34 to 40

bust. Size 36 requires 2¼ yards of 36 inch material. 8247, Semi-princesse gown. Cut in sizes 34 to 44 bust measure. Size 38 requires 4½ yards of 36 or 44 inch material with ⅜ yard 27 inch for collar and cuffs. 7784, Four-gored skirt. Cut in sizes 22 to 34 waist measure. Size 28 requires 4 yards of 36 inch material. 8010, Deep yoke skirt for misses and small women. Cut in sizes 16 and 18 years. Size 16 requires 4¾ of 36 inch material with ½ yard for yoke.

Trouble With Starch Beads:

I noticed in your paper rules for making salt and starch beads. I have never tried making beads, but a friend of mine made some that I thought very pretty, but when the damp, warm Summer weather came the beads became very soft and out of shape. I suppose the dampness in the air had dissolved the salt. Can you tell me if others have the same trouble with salt and starch beads that my friend has had, and if so do you know of anything to prevent this trouble?

A. G. W.

R. N.-Y.—We should like experience from others on this subject.

TOMATO EGGS.—Cut some thick slices of tomato, dip each into flour seasoned with salt and pepper, and fry. Make some rounds of toast; butter these, lay the tomatoes on them, and put a poached egg on each; sprinkle with chopped parsley.

SPANISH EGGS.—Cook two cups of raw tomatoes with a chopped up sweet pepper, frying the two in a tablespoonful of butter. Add paprika, salt and a teaspoonful of finely minced chives and reduce to half the quantity, which will take about ten or fifteen minutes. Toast slices of white bread, put poached eggs on top and pour over the tomato and pepper sauce. Serve at once. Chopped onion may be substituted for the chives.

Mrs. Gruff—Mrs. Funmaker has just been here asking me to join the afternoon literary club! As though I had time or strength to waste over books. I told her I spent all my time over the washtubs, dishpans, and scrubbing floors.

Anty Drudge—You're a foolish woman. Get some Fels-Naptha Soap, let it do the hard part of your work, and join the ladies in their pleasure. Fels-Naptha will give you the time to enjoy yourself.

Fels-Naptha will do these things: It will cut your work in half, and double your time for rest and pleasure; will wash clothes clean, sweet and white in cool or lukewarm water without hard rubbing or boiling; will dissolve grease on pots and pans, and make china and glassware shine; clean porcelain tubs, woodwork, linoleum—your whole house, and do all the **hard** part of the work for you.

Full directions are on the Red and Green Wrapper.

Better buy it by the box or carton.

Fels & Co., Philadelphia

FELS-NAPTHA

Seen in New York Shops.

Bungalow lunch sets consist of a centerpiece and plate doilies of heavy unbleached cotton, the scalloped edges buttonholed in red or blue, and a few sprays worked in to match. Such sets of 13 pieces have been reduced to $1.25. There are scarves and separate centerpieces to match. All the linens and draperies offered for "bungalow" use are very suitable for farm homes, especially in the Summer.

A piece of furniture that would delight any woman is a Martha Washington sewing table of mahogany. It has sliding trays, spool racks, and three drawers, and looks like a quaint old Colonial piece. Such a sewing table costs from $15 to $18.

Small tight-fitting toques of black velvet, trimmed with flaring wings, bows or quills curved at the top into interrogation points, are among unreasonable August fashions. They are entirely without brim, and the wearers look most uncomfortable under the hot August sun. White beaver hats are also appearing. Many draped toques, which are usually becoming, are offered for the Fall. They are not large but fit down low over the head, both in front and back, arranged slanting down on one side. One very picturesque toque was of violet satin, trimmed with upstanding bows of rose color.

Blue serge is always suitable for young girls, and this color and material comes to us for Fall wear with the stamp of foreign fashion. A favorite model is a basque buttoned down the front, long waisted, and joined to a pleated skirt, the join being covered with a serge sash having a bow in the back. Black satin is often used to trim blue serge. Redingote dresses are made of this material, opening in the front over a pleated underskirt.

Some new blouses have Sarah Bernhardt collars—a high collar topped with a sheer pleating. When the collar is open in V-shape in front this frill falls into the new fan shape at the back.

A new basque meant to take the place of a separate blouse, is of black satin, buttoned all down the front with jet buttons. It has long set-in sleeves finished with pointed cuffs, and a sash that ties at the back. A high flaring white organdie collar finishes the neck. Wear this basque over a pleated skirt, and one may feel really up to the times, although it looks like 1885.

Among some of the new jewelry seen are very pretty ornaments of black enamel with rhinestones or pearls, set in sterling silver. The velvet neckbands now fashionable are trimmed with slides of this style, and there are also very attractive circle brooches. Among jet ornaments, we see necklaces of jet beads finished with an old-fashioned jet locket with a raised design cut like a cameo. Such things have been old-fashioned for a generation, but are now new again. A very pretty and unusual bead necklace was of large round cut crystal beads, separated by two-inch spaces of jet bugles alternating with small round cut jet beads.

Some of the shops now selling table linens call attention to the fact that much of the flax used is grown in Russia, "rendered" in Belgium, and then woven in Germany, Ireland and Scotland. This naturally presages higher prices on linen, although we have broad prairies to grow the flax, and busy industrial cities to weave it. Some pretty lunch sets seen were unbleached damask, not creamy, but the regular silvery brown of unbleached flax. The cloths were round, with scalloped edges. For lunch sets, colored and unbleached linen is very much in vogue. Some of these sets are white damask with colored borders, pink, red, blue or yellow, while some are damask in the solid color. Such a set in delft blue damask would be especially pretty with white and gold china. Among bath towels, the handsomest we have seen were made in Spain, a country we do not ordinarily associate with that class of textiles; they are Turkish toweling almost as soft and fine as plush, with handsome colored borders.

Freshening Salty Meat.

ONE Winter when we were not at home we entrusted the curing of our pork to the hired man, and as a result the meat was so salty that we could hardly use it. We allow two weeks for bacon and four or five for ham, with an extra week if the pieces are very large, but this meat was in strong brine exactly 11 weeks. The hired man's excuse was that the brine froze so solid that he could not get the meat out till it thawed of its own accord. Be that as it may, that meat, when smoked was crusted with salt. We did not feel so disappointed about the bacon, as we like it best with beans, green and dry, succotash and other dishes that could take up the salt, but for frying the ham we were blue indeed. No housekeeper likes to have her hams bitter with brine, and very few want to boil every pound of ham and shoulder, so we had to find ways and means to freshen that meat.

We tried hot water and cold water, long soaking and short soaking, sweet milk and buttermilk, mild boiling and various other things people told us, but among all these cure-alls, we decided on a combination. Perhaps there are better ways than we evolved out of the mass of directions, but if any woman is searching for a plan to freshen salt pork and still have the pork taste fairly good, I can recommend the following. The trouble with many of the things we tried was that they left the meat tasting very much like old leather or something equally tasteless.

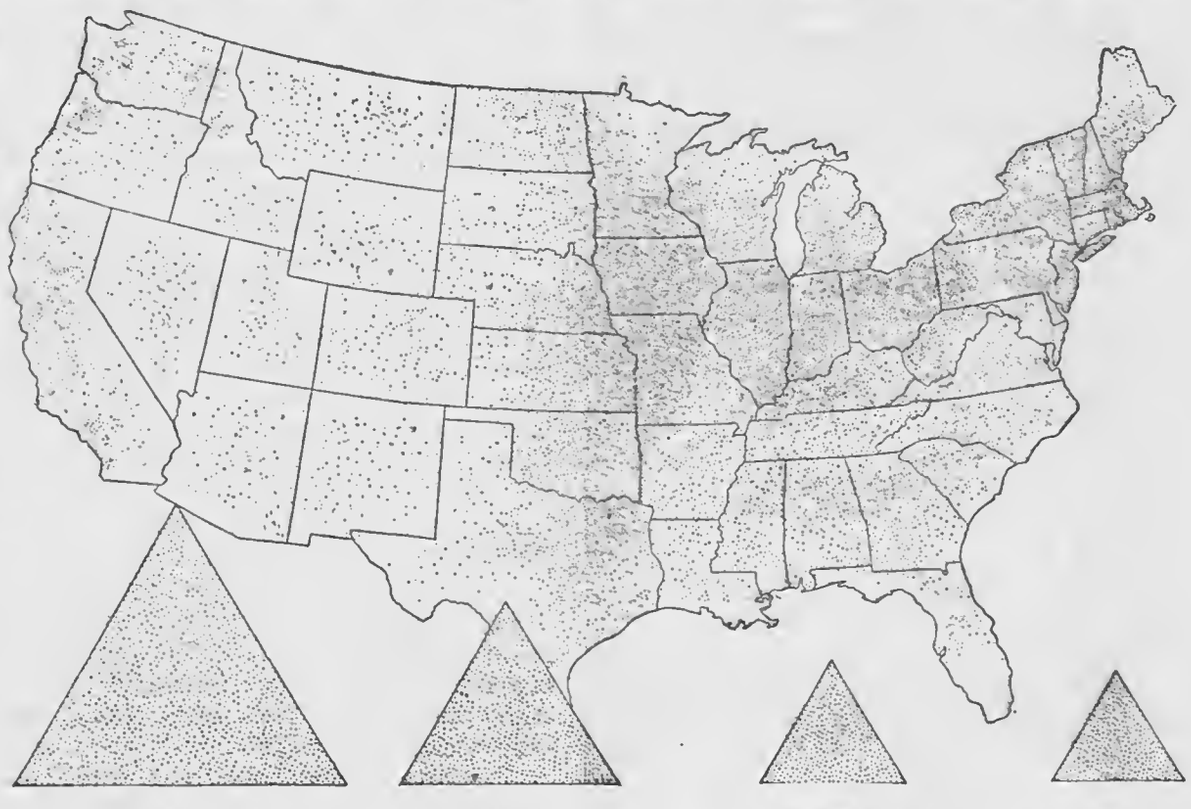
Soak your meat all morning if you want it for dinner, in cold well water, changing at least three times. About one hour before dinner cover with sweet milk and allow it to stand in a moderately warm place. When ready to cook wash well and put in a frying pan with a little fryings and butter mixed. Fry carefully and it will brown as well as ham that never was soaked. I cannot truly say this is as good as ham that is not salted too much in the start, but it is far better than many people are accustomed to when they have oversalted their meat. We were overjoyed to make the meat as good as it proved by this method, for we felt sure we never could dispose of it in its first state.

HILDA RICHMOND.

Creole Toast.—Beat up four eggs and add to them the same number of tomatoes, free from skin and seed and finely chopped; also a small teaspoonful of chopped green chili, gherkin or capers, half a cupful of milk and a little salt. Melt one and a half tablespoonfuls of butter in a saucepan, mix all the other ingredients together, pour into the pan and stir over the fire till thoroughly hot. It may then be served at once on pieces of toast, or may be allowed to cook gently by the side of the fire for five or ten minutes as preferred. Serve very hot. The above mixture might also be baked in the over for 20 minutes and then garnished with small pieces of toast. In preparing it, one egg and one tomato may be cooked for each person served.

SEE that boat rowed by two men; when they keep time in rowing it goes smoothly over the rough waters; but if not, each wave gives its shock and any stroke of the oar wrongly applied may capsize the frail skiff. Marriage is the bark, the rowers the wedded pair on the sea of life. Only by pulling together can they lessen the dangers of the voyage.—Duc de Livis.

What the Telephone Map Shows



56.8% Exchanges Bell-connected, but not Bell-owned.

23.5% Exchanges Bell-owned.

10.5% Exchanges not Bell-owned or connected.

9.2% Places served by two companies.

EVERY dot on the map marks a town where there is a telephone exchange, the same sized dot being used for a large city as for a small village. Some of these exchanges are owned by the Associated Bell companies and some by independent companies. Where joined together in one system they meet the needs of each community and, with their suburban lines, reach 70,000 places and over 8,000,000 subscribers.

The pyramids show that only a minority of the exchanges are Bell-owned, and that the greater majority of the exchanges are owned by independent companies and connected with the Bell System.

At comparatively few points are there two telephone companies, and there are comparatively few exchanges, chiefly rural, which do not have outside connections.

The recent agreement between the Attorney General of the United States and the Bell System will facilitate connections between all telephone subscribers regardless of who owns the exchanges.

Over 8,000 different telephone companies have already connected their exchanges to provide universal service for the whole country.

City Comfort in Farm Homes

Here is a new furnace—"The Pipeless Wonder"—requires neither flues nor pipes in walls or cellar. Guaranteed to keep the house warmer and cozier for less money than any other system. No more carrying coal upstairs and ashes downstairs. No floor space wasted for stoves. Makes the farm home as comfortable and cozy as the steam-heated flat.

Guaranteed to Save At Least 25% of Fuel

THE Monitor CALORIC

30 Days' Trial Satisfaction or Money Back

Distributes heat perfectly through one register, necessitating only one hole in the floor. This register has a center and outer channel. As the warm air rises through the center channel the cold air is forced down and drawn into the furnace through the outer channel; there it becomes heated and again comes up through the center channel to warm the house. This continuous circulation of air makes the "MONITOR" more efficient, economical and healthful than any other heating system. Saves all the floor space in your living rooms now taken up by stoves, and yet your upstairs rooms will be warmer than stoves ever make them.

You take no risk when you buy the "MONITOR." Use it 30 days and if not perfectly satisfactory, we will refund your money. We build this furnace ourselves in our own immense factory and know what it will do. We have been in business almost 100 years and our guarantee gives you absolute protection.

FREE: A copy of our booklet, "The Pipeless Wonder," mailed postpaid. Send us your address. If you will give us the size of your house, number of rooms, etc., we will help you solve your heating problem at less expense than it has ever cost you before. WRITE TODAY.

LINE-BREEDING HOGS.

I AM interested in line-breeding of hogs. Would you tell me how it is done?
E. S. R.

Line-breeding of animals consists in mating close relatives for the purpose of perpetuating and intensifying the blood of a certain individual or family. It is not done for the purpose of line-breeding, which in itself is essentially disadvantageous, but for the purpose of retaining certain desirable characters which otherwise would become scattered and lost. There is, therefore, no special method of line breeding hogs; if you have an individual of merit whose blood you wish to perpetuate and intensify in his progeny you can mate him to his direct descendants, or you can breed less closely by confining your matings to members of the same strain or family. To line or inbreed successfully one must be acquainted with the general laws of breeding and have a close acquaintance with the merits and defects of the family with which he is dealing. This cannot be taught in a few paragraphs but is the result of experience, observation and study. For the amateur breeder to resort to close line breeding would probably result in deterioration rather than in improvement in his herd. There are many books devoted to the science of breeding, of which Davenport's "Principles of Breeding" is considered one of the best.
M. B. D.

REVIVE THE LOCAL SLAUGHTER HOUSE.

THE high cost of living has its foundations laid deep. The farmer, as a class, will never succeed in getting his proper share of the value of the produce which he raises until he looks for, and finds the reason, which blocks the wheels of trade in the goods his farm produces. Instead of striving to form clubs to buy supplies in wholesale quantities he may better seek for the obstacle which blocks his opportunities. Unless I am deceived, the sanitary rules adopted in his own community are the bowlders which prevents his having a market in his home village for every beef, sheep or hog which he can get ready for food. Take the sanitary rules and read what is required in and about a slaughter house, and then inquire why your local butcher abandoned the one which formerly was used, and why another is not established.

Your local butcher does not want beef alive because those sanitary rules are the slickest means for the restraint of trade which have ever been devised. A head might remain in a secluded corner for more than 24 hours, waiting for the bone picker, he being delayed by some breakage of harness or wagon; no matter, a rule is broken, fine and costs to pay. The profits of a week gone and no one but the justice, constable and lawyer benefited. The constitution gives fines to the justice. The people pay the constable and justice, while defendant pays the lawyer more than the legal fees of the others. Can it be wondered at that a market man prefers to buy meat all ready for his block?

What the farmer needs is liberty. What the people need is liberty, not a liberty to do wrong to others but a liberty to be just with all their neighbors. A slaughter house is not a parlor, and those who have one cannot be expected to use it for the community, under rules which are virtual blackmail, are unreasonable, excessive and useless. One remedy would be a law that each town shall provide a slaughter-house, and as the people are taxed 10 cents each for the health officer, let it be his duty to inspect such house once each week.

New York. MILES H. DELONG.

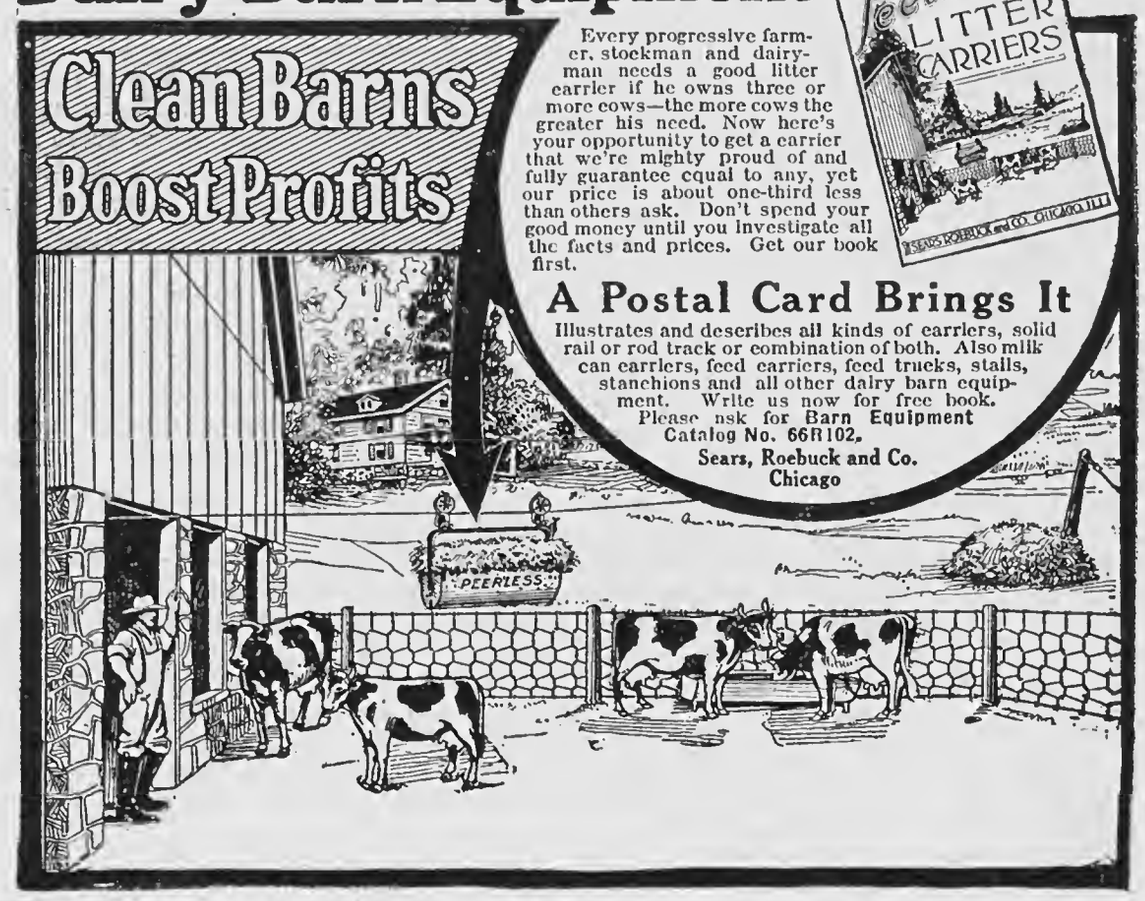
Failing Cow.

A cow six years old has been failing in health for several months. She freshened four weeks ago, and has never gained in strength. She is thin, has an occasional dry cough, and droops her head. What do you advise. R. D. K.

Maine.

Tuberculosis probably is present in this case and we should not feel justified in prescribing treatment. Have her tested with tuberculin and meanwhile do not use the milk. Any graduate veterinarian can apply the test. A. S. A.

Let this Free Book Save You Money on
Dairy Barn Equipment



Every progressive farmer, stockman and dairyman needs a good litter carrier if he owns three or more cows—the more cows the greater his need. Now here's your opportunity to get a carrier that we're mighty proud of and fully guarantee equal to any, yet our price is about one-third less than others ask. Don't spend your good money until you investigate all the facts and prices. Get our book first.

A Postal Card Brings It

Illustrates and describes all kinds of carriers, solid rail or rod track or combination of both. Also milk can carriers, feed carriers, feed trucks, stalls, stanchions and all other dairy barn equipment. Write us now for free book.

The Prosperous Farmer Is the Wise Feeder

And wise feeding now-a-days means constant crowding. You must keep your stock in condition with keen appetites for every meal. Make Xtra-Vim Feed a part of the daily ration and it will turn the trick for you and will keep the stock free from digestive and intestinal troubles.

Xtra-Vim Feed is a concentrated pure Porto Rican Cane Molasses in dry form. To it is added a small percentage of Sphagnum Moss, which is a fine digestive agent and improves the effect of the total ration.

XTRA-VIM FEED

is a 100% value food. Contains no cheap non-nutrient fillers, is not only highly palatable and nutritious itself, but renders other foods more palatable and more easily digested. It replaces pound for pound of more expensive grains and causes a general improvement in the health of the animal.

Xtra-Vim is dry to the touch and is put up in 100-pound bags. No freight on barrels, no leakage, no loss from sticking.

Write for Literature and Prices

If Xtra-Vim is not for sale at your feed store, get our Free Book and prices.

J. E. WATSON, MARBLEDALE, CONN.

NEW ENGLAND MILK SITUATION.

IN the July 31 issue of Hoard's Dairyman, Mr. Webster in his brief report of the proceedings at the meeting of the milk conference at the Boston Chamber of Commerce on July 1, states that the farmers' representatives had a hazy idea of the situation, and that many did not seem to understand it at all. This at least is what anyone would think after reading his article. I differ very much on this question. In the first place there were few or no practical farmers or milk producers there. About all present were theorists, and no more represent the milk producers of New England than a gathering of railroad officials would represent the labor organization of the men employed on their roads. By the general tone of his report one would gather that this conference was to teach the farmer how to make cheaper milk, or rather to make milk more cheaply than is done at present. Apparently this is the only issue of the whole affair, to teach the farmer to improve and reduce his cost of production. Now this is a wrong idea. There are many other sides to the question besides the farmers' that need teaching and something more. There is no doubt in the mind of those who know the true situation and condition of the New England milk producers that the kind of milk wanted and demanded cannot be produced any cheaper than at present, and in many cases price received does not cover cost of production. There are of course individual cases where there could be a saving made in different ways by better cows, better handling, etc., but the majority of New England milk producers know their business, know their conditions, in fact are up-to-date business men, and to state that there is room for large improvement and better cows and such tales show the utter ignorance and lack of understanding of anyone who makes such a statement. Ask any of the leading producers whether they would care to or would under any circumstances produce milk for Boston market or any other at the price the general farmers are receiving for wholesale Boston milk. These are undoubtedly making money out of the production of milk. How are they doing it? By marketing their product to special customers who are willing and able to pay a reasonable price for a good product. These and some others are in the position to conduct their whole business themselves from cow to customer, and while even they have their troubles they get 100 cents out of the dollar, not 25 or 35 and some one else get the rest.

I am pretty well posted as to how much money can be made in ordinary milk production both by personal experience and the experience of all dairymen about this section, and of all I know I can at this time recall but two who have made money on making wholesale milk for Boston market and both of these had other products which paid better and thus helped much in the general result. One of these made his money some years ago when conditions were different, and is not just now making a can of milk for market, but will later do a little along this line. Another case is a man who has kept a large dairy, that is 20 to 30 cows, for many years, and no one has any better cows or knows a cow much better than he does. He has made money, but not all out of cows. He has bought and sold three different farms and made a good figure on each sale. He has also kept poultry on a fairly large scale, raised chickens to sell and made good profit out of these; in fact he said he made more out of these at different times than from his cows. On one of these farms he had a large house on a high sightly location, and took Summer boarders at $1 per day each. This was some years ago when general prices on food, etc., were low, and he made money on this venture, so really only a small part of his present accumulation came from profit on keeping cows for market milk. One very intelligent man, well read and wideawake, has a grown son who has been through the Massachusetts Agricultural College to assist him; both are hard workers, keep a good-sized herd of grade Ayrshires, know what it costs to feed, understand all about rations, etc.; yet both will tell you there is really no profit in the milk end of the business, but they do well on apples and small fruits, getting, by far, their best income from these. A. E. P.

Jumping Steer.

I HAVE a steer which jumps fences; we have tried a board over the eyes; also a yoke with no success. Please let me know some way to stop jumping as steer is very valuable and I do not want it to get out. S. I.

Will some of our readers answer this? How can we cure a jumping steer?

SOILING HOGS.—You have had some discussion about soiling hogs. I think you will be interested to know that I have kept a number of brood sows in fine condition for five or six weeks on nothing but freshly cut peas and oats, fed twice daily. J. C. S.

BERKSHIRE SWINE FOR ARGENTINA.—H. C. and H. B. Harpending of Dundee, N. Y., have just sold to the Argentine government a herd of 11 breeding hogs, which will be shipped to that country in the present month. William Riis, director of the Government Agricultural Station at Buenos Aires, recently visited and inspected Messrs. Harpendings' large yard.

Bell Phone 14, F.5.

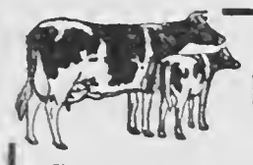
HIGH GRADE
HOLSTEINS
100 cows due to freshen in Sept. and Oct.
100 fresh cows and springers.
PRICE, $75 to $100.00 EACH
All large, well bred, nicely marked and heavy milkers. 100 2-year-old heifers due to freshen this Fall, and all in calf by registered bulls. You can pay more but you can't buy better.
F. P. SAUNDERS & SON, Cortland, N. Y.
Office, 50 Clinton Ave.

IT IS DOUBTFUL
If there was ever better value offered in young registered HOLSTEIN FRIESIAN BULLS than there is in the half dozen we are offering right now. They are sired by King Pontiac Segis Kerndyke No. 84705, whose dam was a 30-lb. daughter of Pietertje Hengerveld Count De Kol; she milked over 100 lbs. per day. These bulls are from nice young cows with A.R.O. records, and when you write us for special price on them you will be surprised to learn how low it is. Write to-day; to-morrow may be too late to secure one of them at this special price.
SOMERSET HOLSTEIN BREEDERS CO.
Lock Drawer I - Somerville, N. J.



Purebred Registered
HOLSTEIN CATTLE
The Capital, Topeka, Kansas, June 16, said: "When Maid Henry, the famous 13-year-old Holstein owned by the Kansas Agricultural College, was working so hard for the record of 19,600 pounds of milk and 835 pounds of butter in a year's time, dairymen prophesied that the Maid would be ruined. But Maid Henry returns to show that she is some cow even after breaking a record. She has a 114 pound male calf, born just the other day to prove it."

Day after Day, Year after Year,
PRODUCTION COUNTS!
It is not what a cow can produce in 7, 14, or 30 days, even in a year that determines her value to the farmer. It is what she can do in a lifetime.
Brown Swiss Cows rank high in average production and are regular and persistent breeders and producers. Year in, year out, they make good records and raise good calves without any coaxing or pampering. If interested, we will send you an illustrated booklet.

Your Credit is Good

You wouldn't think there was much of a connection between a banking house and a farmer's tool shed.

Well, the *American Agriculturist* declares, after an investigation in seven states, that the average banker will loan 20 per cent. more on property where buildings and implements are well painted than where they are not. With this in mind remember that

Dutch Boy White Lead

and Dutch Boy linseed oil are the great protective materials. They make the farmer's paint. Keep the ingredients always on hand. An opened white lead keg with water on top keeps the lead fresh indefinitely. Linseed oil actually improves with age. Mix them up as needed. Tint them any color, use them anywhere, from the painting of your plow handles or a step ladder to the decoration of your finest rooms.

You can now get red lead in paste form, same as white lead. Doesn't harden in the can. Fine for painting resinous wood; best by all odds for implements and metal work. Ask your dealer.

Text Book of House Painting **FREE**

Ask for Farmers' Paint Helps No. 2512

Tells you how to mix "Dutch Boy" with any color, for any wood, or any purpose; also how to choose and use colors to look best, to estimate amounts of paint required, and to test paint for purity. Write today and be ready for painting time.

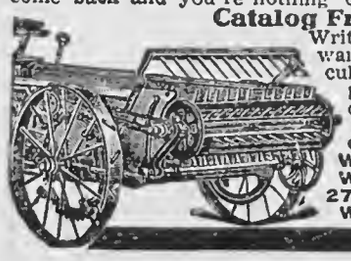
Cash, Credit, Note or Easy Payments. One of these will suit your needs. Any plan allows you 30 days for trial of Engine, Cream Separator or Manure Spreader. If not satisfied that they are as good as any you ever saw or heard of, the goods come back and you're nothing out.

Catalog Free



Write for catalog you want. Get full particulars and my special prices, extra low on Engines, Separators and Spreaders. Address Wm. Galloway, Pres. Wm. Galloway Co., 277 Galloway Sta., Waterloo, Iowa.

RE-WORKING BUTTER.

OFTEN it is necessary to rework butter because it has not been sufficiently worked to distribute the salt uniformly. This lack of uniform distribution of the salt causes uneven color, which is usually known as streaks and mottles.

The first step in the re-working of butter is to get it in the proper plastic condition. If too cold and hard, too much working is required, too much moisture is expressed and the body becomes tallowy. If the temperature is high, a greasy condition is obtained. The writer has used two methods of obtaining the proper condition of the butter for re-working.

First, if the butter is in prints of one-half to four or five pound packages, it may be set in a room of say 60 to 70 degrees Fahr. to soften, or if the packages are larger the butter may be cut in small pieces. The room temperature method may require from a few to many hours.

Secondly, the warm water plan may be used as follows: If there is not sufficient time to use the room temperatures, place the butter which has been cut in pieces of only a few ounces in water at approximately 60 degrees Fahr. In an hour or two the butter will become soft. In this case some of the salt will be taken from the butter, thus making it desirable to add salt when re-working.

If the butter is from different churnings and varies in shade of color to any great extent, there is little use of the average butter-maker attempting to make a uniform color. It is always well to mark butter that is handled in this manner "Re-worked Butter," so that the butter dealer may not make a mistake of putting it out with the rest of the shipment. The completion of the re-working process is determined by appearance, and this can best be learned by experience. The butter should be worked until it becomes waxy. If mottles appear after the butter has been in the refrigerator over night, they are significant of the fact that the working process should have been continued. The re-working of butter is usually to simply finish an unfinished process in order to obtain a butter of a reasonably well distributed salt, and therefore a uniform color. E. S. GUTHRIE.

Ithaca, N. Y.

KINDNESS FOR STOCK.

ONE of the intense examples of a scrub herd that has come to my attention was one owned by a partially insane man. He had but few fences, and they were only landmarks. The cows would break in the corn, and he would drive them to the stable and lambaste the cows with a fence rail for all in him. The cows were so poor they were shadowless. I know another farmer who dogs his cows to and from the pasture, and every night and morning in the barn he has a fence stake handy to help them in their places. The cows are in the half a pint a day class, the buildings are tumbling down, and the interest on the mortgage has gone unpaid for the past two or three years.

I know another dairyman, a keeper of grade cows. He permits no loud talk in his barn. He is a quiet and gentle man. He coaxes his cows. His animals are all good producers because their nervous energy is not burned up by fear. They are all contented animals, they pay him a profit. I know still another farmer who keeps purebred stock. He will not allow any profanity in his barn, not because of his piety, but because profanity goes with loud talk. He carefully selects his hired men on the basis of their gentleness about the barn and with the herd. It pays him dividends to do it. W. J.

LEADING THAT COW.—Years ago THE R. N.-Y. gave a method for leading a cow which I have found to work on all but one; that was an old one that had a habit of bolting, when nothing could hold her. Unfortunately it can only be used with a cow with horns. In the end of a rope make a knot a little larger than the horn, slip it over one, pass it to the other, and take a half hitch, then back to the first horn, pass a loop through it, one part above the horn and the other below and catch the ear in with it. Standing off five or six feet pull on the rope until quite a pressure is upon it. If the cow yields, loosen it and again step back, keeping it up until she yields without force. If a cow is very stubborn it is often well, instead of trying to make her come to you while keeping the pressure up, to approach her slowly and loosen the rope. My experience is that there are very few cows that cannot be taught to lead in a few lessons of from five to 10 minutes. S.

Oregon.

RUMELY

Power Farming Machinery

RUMELY GASPULL LA PORTE

Like A Farm Wagon

The GasPull can be used every week the year 'round for dozens of jobs, and it saves money on every one. It never tires, and is ready for work night and day.

The GasPull burns gasoline; has an opposed, horizontal, double cylinder motor and is water-cooled. Working parts are easily lubricated and protected from dust and dirt by steel covers. It is cranked from the ground, has a safety crank and handy foot-brake, and can be equipped for speeds from 2 to 3½ miles per hour. It weighs only 11,200 pounds. 15-30 horsepower.

Ask for catalog GB4. Get acquainted with the GasPull.

The OilPull is the leader in kerosene tractors. There are no better stationary engines than the Rumely-Falk for kerosene and the Rumely-Olds for gasoline. Every Rumely machine is backed by Rumely service—49 branches and 11,000 dealers. Supplies and parts without delay.

THE EGG-LAYING CONTEST.

THE forty-second week shows an egg production of 3,065; 30 eggs less than were laid during last week, but last week's gain over the previous week was 145, showing that most of this gain is still retained. Bonnie Brook Poultry Farm's Leghorns led the procession last week with 61 eggs; they lead again this week with 56 eggs to their credit. Tom Barron's Leghorns are second, with a score of 55 eggs. This pen is steadily crawling up on the leaders, and is 89 eggs behind Francis F. Lincoln's pen, which is now the leader of the contestants, being four eggs ahead of Barron's White Wyandottes. Pen number 42, the "sour milk" pen from Storrs Agricultural Station, has a score of 1,794, beating them all, but this is an experimental pen, and is not contesting for the prize. Manor Poultry Farm's pen comes in third for the week with a score of 54. Marwood Poultry Farm is fourth, with a record of 51, and pen 42 is fifth, with a score of 50. All of these pens are White Leghorns.

That these egg-laying contests are resulting in a great gain in egg production is beyond dispute. At the Thorndale contest the figures show a gain over last year of 8,752 eggs in the 41 weeks; and last year there was a heavy gain over the previous year. The introduction of new blood from the yards of breeders whose birds make the highest records, is spreading this gain all over the country; and the result can hardly be other than a decided improvement to American poultry keeping. The week's record follows:

Capacities, 1,200 to 20,100 Eggs
(Sectional Construction)

Hall users make money. They are far more successful than the average in the poultry business.

Re-orders indicate satisfaction. The Hall leads in new sales as well as in selling old customers over and over again. There is security in Hall Equipments.

The reason. Bigger hatches of bigger, better chicks or ducks that grow into money quickest with least trouble and expense. Extra chicks of extra vigor pay for the Hall. It is the original and standard.

Small users write just as enthusiastically as this best known poultry plant:

Pittsfield Poultry Farms Company
Pittsfield, Maine Holliston, Mass.
July 7, 1914.
We can speak only words of satisfaction of the efficiency of *Hall Equipment.* The 100,000 capacity that we have gives us excellent service. *We would not think of installing any other machine that is now on the market.* You will probably receive an order from us for 65,000 additional capacity before fall.
Pittsfield Poultry Farms Co.
F. W. Briggs, Treas.

What size can you use? Write us in detail and ask for information. Would you like our SERVICE SPECIALIST to call and help you to get the right equipment and results?

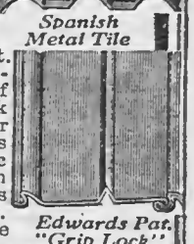
Lowest Prices Ever Made on World's Best Roofing

Lightning-proof, Fire-proof, Rust-proof, Rot-proof, Galvanized Steel Roofing Lasts as Long as Building Stands
Once you have purchased and laid EdwardsTightcoteGalvanizedSteel Roofing your roofing expense for that building is at an end. Its cost per square is the lowest ever made. It has no upkeep cost. Always beautiful in appearance. Reducing cost of fire insurance.

Reo Cluster Steel Shingles

EDWARDS Exclusive Tightcote Process
Makes Rust-Proof Roofing. The zinc spelter becomes practically one piece with the steel. No ordinary galvanizing can compare with it. Each and every Edwards Metal Shingle, Metal Spanish Tile, each sheet of Edwards Reo Steel Shingle, Grip-Lock Roofing, Pressed Standing Seam or Roll Roofing, Ceiling, Siding, etc., is dipped in a bath of molten zinc, one at a time after the metal has been stamped and resquared. The edges are galvanized as heavily as the sides. Not the space of a pin-point on the steel is exposed to the weather.

Spanish Metal Tile



Edwards Pat. "Grip Lock"

How To Test Galvanizing
Take a piece of any other galvanized steel, bend it back and forth several times, hammering it down each time. You will then be able to flake off great scales of the galvanizing with your finger nail. Apply this test to a piece of Edwards Tightcote Galvanized Steel Roofing—you'll find no flaking.

Corrugated

EDWARDS Patent Interlocking Device
Prevents Warping, Buckling or Breaking. Protects Nail Holes. Roof never warps, buckles or breaks—nails are driven through the *under* layer not exposed to weather—cannot rust. No special tools or experience needed to lay EDWARDS Galvanized Steel Roofing; anyone can do the work—lay over old shingles if you wish.

Brick Siding

Reo Steel Shingles
Cost Less, Outwear 3 Ordinary Roofs and are your joy and pride forever. No matter what kind of a building you have in mind there is a style of EDWARDS *Tightcote Galvanized Roofing* exactly suited to your needs.

Ceiling

GARAGE $49.50

PUBLISHER'S DESK

We are making some progress. Last March the Board of Aldermen of New York City passed an ordinance, or law, imposing a fine of not less than $25 nor more than $250, or imprisonment of not less than five days or more than six months, or both such fine and imprisonment, on any person convicted of selling or attempting to sell goods through fraudulent, deceptive or dishonest advertising of any kind, whether in papers, on signs, on billboards or in letters or circulars. Last week a clothing merchant was convicted under this law on a suit brought by the vigilance committee of a local association of business men. This being the first conviction the offender was let off easy; but the court publicly announced that hereafter, all offenders would feel the full punch of the law.

Regarding the Mecca Co-operative Co., of Philadelphia, Pa., will say that I purchased stock through two agents, one of whose name is on the enclosed slip. Their agreement was that no one could ship produce, etc., to the company without being a member, and that the company was to have its own distributing house, its own teams and operate a number of stores (they claim to have 25 or more in Philadelphia), to dispose of the produce, and that they would save the members the commission and cartage, and pay them equal to or above Philadelphia record quotations for anything they shipped. Also, they agreed to return all crates, coops, hampers, barrels, baskets, packages, etc., in which goods were shipped, and that they would pay a yearly dividend of 6 per cent. at least on the investment. Any member becoming dissatisfied at the end of one year could, upon surrender of his certificate, claim his money as stated per conditions on the certificate. We shipped this company some early apples. They sent us a card saying they brought from 75 cents to $1.15 per hamper. They sent us the returns for only 60 cents. I wrote and asked them why they sent us only 60 cents, and they sent us an itemized bill, taking out so much for freight, cartage and commission. This same thing happened to all our shipments to them before, and they do not return the crates, hampers, etc. This seems to be the general complaint of all the members around here. S. B. C.
Delaware.

The above letter from a member of the Mecca Co-operative Co. may prove of interest to those approached to invest money in the scheme in the hope of finding a better market for their produce. It will also serve as a public reply to the inquirers who have written us for advice regarding this proposition. Notice was sent to members August 13, that the Philadelphia branch would be closed on the following day. S. B. C. holds two shares of the preferred stock. If there is still anyone who has faith in the scheme the stock can undoubtedly be purchased at a substantial discount.

The Rex Co., Chicago, Ill.
Gentlemen:—

I have this day received a razor, which you have sent to me without any authority whatever. I am perfectly sane and competent, if I wish to buy a razor, to order it. Evidently you have my name on your "sucker list," but it is too late for suckers to bite for this year at least. As I have not ordered it I am under no obligations to return it, it will be here any time you call for it. C. A. B.
New York.

The above letter might well be taken as a model for country people who are sent razors or other goods that have not been ordered by them. The only way to stop this nefarious business is to make it unprofitable and if everyone receiving goods in this way would take the same attitude as C. A. B. the annoyance should soon cease.

Mail addressed to George H. Brinkler, the style specialist of Washington, D. C., is returned by order of the Post Master General marked fraudulent. The Post Office Department is doing the people a real service in barring the literature of quacks of this sort from the United States mail.

Having some 20 years' experience in mechanical and electrical work, and desiring a better position, which is impossible at present employment, I saw an advertisement calling for skilled men with some money. In answering same I received the letter and blank enclosed with this. Kindly advise me what you think of this undertaking. E. E.
Connecticut.

The literature forwarded is from the Meador Power Company (being incorporated) of Crockett, California, offering positions to skilled mechanics at a salary of $3,000 per year with board and lodging, and double pay for overtime work. It is provided, however, that the company shall have the option of paying this salary in six per cent. preferred stock. As the company is apparently not yet organized, it is purely a matter of speculation as to whether the stock ever will have any value. Another condition specified to secure the employment is that the applicant invest $250 on a yearly contract or $125 if the employment is to be for six months. It has been our experience that any offer of a position that carries with it the investment of stock in the company results eventually in the loss of the money invested, and in many cases promoters have offered what appear to be lucrative positions for the sole purpose of making a stock sale. This scheme is so transparent that we hardly think any of our people will be inclined to entertain it, but so many propositions of a similar nature are being sent to country people, that a word of warning is not out of place.

June 29th and July 2 respectively we shipped a case of eggs to the Standard Poultry Farms of 215 Sutter Ave., Brooklyn, N. Y. We cannot get any word from them. I have traced the eggs and find they were delivered, and have written them twice. If they are swindlers, will you expose them? We have their agreement to take the eggs at 30 cents per dozen. We wish to have the account put in the hands of a collector. K. B.
New York.

The Standard Poultry Farms make no reply to our letters in behalf of our subscribers, so we can only conclude that the failure of the firm to settle for the shipment of eggs was not due to any accident or oversight. We publish so many cases of where shippers lose their produce through shipping to parties with regard to whose reliability they know nothing, that it ought not be necessary to repeat the warning that shippers should investigate the reliability of the individuals or houses soliciting shipments of produce before instead of after the shipment has been made.

What helps the quality of your cured meats? *Flavor.* What salt brings out the full flavor? *Worcester Salt.*

Use it. Worcester Salt makes the clean, sparkling brine which stays free from slime and "ropiness." It gives to your hams, bacon and salt pork, that sweet flavor prized by epicures.

WORCESTER SALT

The Salt with the Savor

The fine even crystals of Worcester Salt also make it best for butter making. Our patent process frees it from bitterness that spoils flavor.

For farm and dairy use, Worcester Salt is put up in 14 lb. muslin bags and in 28 and 56 lb., Irish linen bags. Get a bag from your grocer.

Write for booklet "Curing Meats on the Farm." Sent free on request.

Amatite ROOFING

It needs no painting

Put Amatite on your farm buildings and you need never worry, for you have a *good* roof.

It is a comfort also to know that you won't have to paint these roofs, for frequent painting costs almost as much as a new roof.

Amatite is waterproofed with Coal Tar Pitch, the best waterproofing material known, and it has a *real mineral surface.*

Write today for sample.

For Concrete Walks—Lehigh

Be guided by the experience of the big contractors who specify Lehigh Cement for concrete walks. Thousands of miles of Lehigh Cement Concrete walks, in rural districts, are giving durable service.

You will not feel disturbed over concrete results if you specify

LEHIGH PORTLAND CEMENT

Our special scientific process endows it with an unusually high strength. This strength increases with age and imparts a greater strength to the structure as time goes on. Lehigh Cement is a dependable safeguard for good concrete structural work.

You should send for "The Modern Farmer"—our book that explains "Lehigh" quality and gives full instructions on building with concrete. It tells how to lay concrete walks and how to build concrete farm buildings.

LEHIGH PORTLAND CEMENT COMPANY
801 Young Bldg., Allentown, Pa.
108 Consumers Bldg., Chicago, Ill.

You know the value of concrete walks. There is no wear out to them. They are easy to keep clean and never need repairs. Build your walks of concrete and use "Lehigh"

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending Aug. 28, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914.	1913.
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.10 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.61 and $1.51 for B and C. Hotels and restaurants using two to three cans per day are paying five to 5¼ cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

There has been an advance of one to two cents on practically all grades, but this slackened business and the market was decidedly weak toward the close. Considerable improvement in quality of fresh receipts is noted. There is some business in storage creamery at nearly the top quotation for fresh. City made is selling well; packing stock scarce.

Creamery, extra, lb	31	@	32
Good to Choice	26	@	30
Lower Grades	20	@	23
State Dairy, best	29	@	30
Common to Good	18	@	25
Factory	19	@	23
Packing Stock	19	@	22

Elgin, Ill., butter market 30 cents.
Philadelphia, western creamery, 32 cents.

CHEESE.

Receipts have been large. Prices still hold to last week's high mark, but demand is so light that some cutting of price seems probable to encourage buying.

Whole Milk, fresh, specials	16½	@	16¾
Average fancy	16	@	16¼
Prime	15¼	@	15¾

Daisies	16¼	@	16½
Skims, specials	13	@	14
Good to choice	11½	@	12⅜
Poor to fair	5	@	10

EGGS.

Receipts have been lighter than the previous week, with considerable proportion of defective stock. Fancy white eggs from nearby are scarce, but business is slow and critical. Very little doing in storage eggs.

White, choice to fancy, large	34	@	35
Common to good	25	@	32

Storage, best	26	@	27
Lower grades	19	@	24

FRESH FRUITS.

Apple market is in poor condition, there being a heavy surplus of low grades. Some Alexander and Yellow Transparent have brought $3, but $2.50 is the top for most other Fall varieties. Pears selling well when good to choice, a few Bartlett and Clapp's Favorite bringing $4.50 per barrel. Peaches are low, but in fairly good demand. Choice from West Virginia bring up to $1.75 per crate. Plums in moderate supply, selling at 25 cents down, for eight-pound baskets. Grape market somewhat improved. Fresh figs from Virginia bring 10 to 12 cents per quart. Berries mainly poor and in little demand. Muskmelons plentiful but so uncertain in quality that the bulk go below 75 cents per bushel crate.

BUFFALO MARKETS.

APPLES are very cheap and picked fruit is now the rule; they are Astrachans, Duchess and Sweet and Sour Boughs mostly, and retail at five cents the two-quart measure or 40 cents a third-bushel basket. Bartlett pears are of good quality, retailing at about two cents each. The prices of cherries and berries have not changed of late, being 25 cents for a six-pound basket at wholesale for late sour cherries, with berries red raspberries 16 cents; black, 12 cents; purple, 11 cents; blackberries, 14 cents for highest wholesale price. There are a few currants at 25 to 40 cents a basket, both red and black.

Potatoes are stronger and there are quotations as high as $1.25 per bushel, wholesale, but it is still possible to get fair ones at $1 retail. Sweet potatoes are not generally to be had. Onions are $1.25 to $1.50 per bushel, wholesale and cabbage is not quoted above $3.50 per hundred. A few bunched white turnips are coming in at low prices, as the quality is poor. Bunched vegetables, beets, carrots, retail at three to four bunches for five cents. Beans are five cents and peas eight cents per two-quart measure. Tomatoes are not plenty yet, retailing at 40 cents a basket. A few peppers bring 75 cents a box. There is a fine lot of celery in, very long and white, but only 25 cents a dozen, wholesale. Fine cucumbers wholesale at 30 cents a dozen or $1.50 a bushel, retailing at three for 10 cents. The largest lettuce heads recalled are appearing, some of them retailing at 10 cents a head. The regular wholesale price being 60 to 80 cents a dozen. The melon crop is at its best, small watermelons wholesaling as low as 15 cents each by the hundred and not above 40 cents. Muskmelons are mostly five cents each, the wholesale price running from $1 to $2 per crate.

Butter is quoted at 32 cents down, but market retailers still post 31 cents as their top price, retail. Eggs rule firm at 28 to 31 cents for fancy white, western candled being 23 to 24 cents. Cheese is rather quiet at 17 cents for top grade, retailers generally asking 20 cents. The report that foreign cheese would soon be out of reach has not affected the market yet. Dressed poultry is much scarcer than live, on account of the hot weather; 17 to 22 cents for turkey, live; 18 cents for choice fowl; 25 to 26 cents for broilers, 17 to 18 cents for duck, dressed; and 15 to 17 cents for turkey, 15 to 16 cents for fowl, 16 to 19 cents for broilers, and 13 to 16 cents for duck, live, all at wholesale.

J. W. C.

A GLASGOW merchant, famous for his stinginess, came into his office one morning and found a young clerk writing a letter in rather a flourishing hand. "My man," he observed, "dinna mak' the tails o' yer g's and y's quite so long. I want the ink to last the quarter oot."—London Evening Standard.

Subscribers' Exchange

THE CANTON CULVERT CO., Canton, Ohio, manufacturer of "Zyro" Metal Silos, wants an experienced traveling silo salesman to travel New York State, commencing January 1, 1915. Apply now.

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

MAPLE COVE FARM—Products direct to Consumers. ROUSE, 24 Athens, Pa.

WANTED—Second hand, small thrashing machine and stone crusher. RONTZAHN, Biglerville, Pa.

FOR SALE—Colts 50 light Generator; never unpacked; cost $150. No resonable offer refused; must be sold. A. WOSKA, Urlton, N. Y.

BARTLETT and Clapp's Favorite Pears, $1.50 per doz.; Early Richmond Cherries, $1.25 per doz.; sample can prepaid, 20c. SENECA FRUIT FARM, Waterloo, N. Y.

FOR EXCHANGE for White Leghorn Hens or Pullets three Incubators, one outdoor Brooder, three International Hovers. M. E. PHELPS, R. D. No. 2, Ellicott City, Md.

FIG PRESERVES—Home made; a new delicacy for most people; made from choice fruit right from the tree; few people have ever tasted a fig as it ought to be; write for prices and sample to MRS. M. A. PARKER, Rickerly, near Danphin way, Mobile, Ala.

MARYLAND FARM FOR SALE—58 acres on Chester River; soil light loam; ideal for poultry. Apply D. BAMBERGER, Millington, Md.

176 ACRE Poultry and Stock Farm, $3,500; three miles from station; 25 miles from Baltimore, Md. HARRY ROBERTS, Parkton, Md.

FOR RENT—400 acres farm, Michigan; long term; fortune for right man teams and capital to handle. McKIM, Irvington, Ind.

GENERAL PURPOSE or dairy farm of 80 acres with crops and stock. Full description and terms upon application. ROBERT GREGORY, Granton, N. Y.

FARM in Sunny Tennessee for Sale; ninety acres; well improved; adjoining good small railroad town. Price $1,800. Fine climate, fine crops. ALEX. ADAMS, Owner, Oakdale, Tenn.

FOR SALE OR LEASE—Ten acres good land, story and half bungalow; new; heat and water, barn, chicken houses for seven hundred layers. Excellent neighbors, macadamized roads, mile and half to Freehold. ARCHER CROOKS, Freehold, N. J.

FOR SALE—3,500 acres ranch, 400 acres in farm, 3 sets improvements, 4 silos, 1,526 acres deeded, balance leased; deeded land, $14 per acre, lease thrown in; crop, live stock and equipment put in at reasonable price. E. D. HUNT, Owner, Childress, Tex.

NOTICE—A fine farm of 160 acres in Ingham County, Michigan, 5 miles east of the City of Mason, will be sold at public sale on said premises by administrator, pursuant to order of Probate Court of said county Sept. 26th, A. D. 1914, 30 acres of fine timber. MERRITT HICKS, Administrator. Business address, Dansville, Mich.

SPLENDID Commercial Apple Orchard, located in the famous Apple and Tomato Belt—Morgan County, West Virginia; consists of ten thousand trees; portion ten years old. Tomatoes will maintain property. Best of management now on property. Best of reasons for selling. For particulars write immediately, R. R., Care R. New-Yorker.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

YOUNG MAN wants work on farm; can't milk. J. LLOYD DAVIS, Buffalo, N. Y. (Gen. Del.)

SINGLE MAN—Wishes position on up-to-date hog or dairy farm; sober and steady. POSITION, R. N.-Y.

UNMARRIED MAN—Wants work on commercial poultry farm; can furnish references. COMMERCIAL, R. N.-Y.

WANTED—Sober, industrious, married man understands farming, teaming, milking; good pay. JAMES TORRANT, Norfolk, Conn.

WANTED—Work on poultry or small farm by young man; wages no object; best references. Care of C. W. DENSMORE, Springville, N. Y.

POSITION WANTED—By young married farmer, dairy or general farming; strictly temperate; good worker. H. H., Care Rural New-Yorker.

FARM PARTNER WANTED to work with owner on shares; New York State; married man preferred; particulars exchanged. OWNER, care Rural New-Yorker.

YOUNG MAN—Experienced in general farming and gardening, strictly temperate, references, wants position. JOS. ROSENTHAL, Box 52, North Scituate, R. I.

TEAMSTERS and Farm Laborers wanted to work in an Institution; salary, $32 a month and maintenance to begin with. Address SUPERINTENDENT, Letchworth Village, Thiells, N. Y.

POSITION WANTED—As manager of farm or country estate by reliable practical man; married; can furnish good references as to character and ability. Address F. M. B., care R. N.Y.

CHAUFFEUR and handy man wants position; single, Irish-American, willing to run gasoline or kerosene engine, or traction engine; can furnish references. Address T. F. M., care of Rural New-Yorker.

POSITION WANTED—By an A1 school graduate or herdsman on private estate; experience in all branches of farming; expert poultryman, A1 butter maker; single; best of references. Box M. B., Care Rural New-Yorker.

WANTED—Experienced poultry man, married, large plant; private and commercial man, must be up on modern methods; Cornell man preferred. Must have best of references. Address F. W., care of Rural New-Yorker.

A PRACTICAL HERDSMAN seeks position; am Scotch, married, 1 child, age 28 years; have been in this country several years and have held positions as herdsman and dairyman on some of the largest estates in the East; am well qualified and can give highest credentials. Address A. D. STEVENSON, Griffin Farm, Portchester, N. Y.

A PRACTICAL POULTRYMAN desires a position; capable of laying out a new plant or placing an old one on paying basis; successful raising chicks and handling layers in large numbers; understand Mammoth incubators and brooders; agricultural school graduate, 1910; single; best of references. Box B. C. H., Care Rural New-Yorker.

WANTED—Herdsman, unmarried, well recommended, for 200 cows; well experienced with feeding, breeding, accustomed to handle bulls; must be a sober, strong, energetic man, capable to handle twenty milkers and keep upright strict order; good wages, steady position. Send full particulars and references in your first letter. Address L. F., Care Rural New-Yorker.

A METHODICAL, practical, scientific and successful general farm and dairy manager covering years of extensive and varied experience in exacting operations will be open for engagement Sept. 1. Eminent credentials will be furnished and nothing short of a first-class, responsible and remunerative position will be considered. If desirous, might consider cash proposition of lease of entire property. Address T. J. A., care Rural New-Yorker.

FOR SALE—Ideal farm of one hundred acres; the land is deep, rich soil, capable of producing anything; good fourteen-room house; good barns; has been in family forty years; owner must sell. Address Box 165, Cazenovia, N. Y.

FOR SALE—1,621 acres, farming, grazing and timber land in Allegheny Co., Md., 11 miles from Cumberland, on North Branch River, C. & O. Canal, and West Maryland R. R. runs through property; near churches and school. Will sell in one parcel or divide in sections. Liberal terms. R. M. W., care R. N.-Y.

NEW ENGLAND FARM FOR SALE—To Close Estate—Forty acres cultivated land; eighty acres of pasturage and good apple orchard; high ground; good view; four miles from Atlantic Ocean, in the town of North Stonington, Conn. Modern thirteen-room house and small barn; good water; one and one-half miles from trolley, and near State Road. Address ALLYN L. BROWN, Admr., Norwich, Conn.

235-ACRE FARM

with buildings insured for $5,000; 2½-story, stone, slate-roof house, bath, etc.; 1st class barn; 3-story wagon house; granary; automobile house, machinery and other buildings; creek-watered pasture; mile to village. Price, $4,000; ½ cash. For particulars call or address

Apperson Six-45
$1785
126 inch wheel base
Weight 2790 pounds

High Priced Cars

That may be why you never owned an Apperson "Jack Rabbit" Car. The Apperson Brothers—always high priced builders—have for nearly a quarter of a century catered to only those select few who wanted a car that most automobile users could not afford to own. For many years, millionaires were their only customers.

Now at Moderate Prices

The highest quality is still maintained. Their hundreds of workmen, who have been brought up in this wonderfully equipped factory where nothing but fine cars have been built, know nothing about building cheap cars wherein a poor quality of workmanship is used.

Materials All Selected

by Elmer and Edgar Apperson. These great automobile engineers, who have built nothing but high priced cars made from the most select materials obtainable in Europe and America, personally test and select all of the materials used in these new moderate priced cars. The finest quality of steel for axles—the special alloy steel for crank shafts—the selected steel for transmission gears—are all tested and purchased by these two brothers.

Cars of Lightest Weight

This means the lightest cost of operating. This Model Six Forty-Five, furnished with a large comfortable six or seven passenger stream line body, weighs complete, **twenty-seven hundred and ninety pounds.** With its total equipment we believe it is the lightest weight Six for actual size and general appearance yet made.

Weight Is Well Distributed

The average motor car user wonders why his tires wear faster in the rear than in the front. Some users say their cars will not hold the road while others say they are troubled badly with skidding. This is due to the fact that the machinery and weight are not properly distributed. Users who have had these common troubles will realize the real pleasure of motoring when they drive an Apperson Jack-Rabbit.

8,000 Miles for Tires

Eight thousand miles on a set of tires may be obtained with one of these light motor cars.

The perfect distribution of weight, the beautiful operating brake and the Apperson metal clutch which operates with the smoothness of oil, all combine to prolong the life of the tires and to establish a mileage not usually found in motor cars of this size.

Models for Next Year:

A Four-40, 2580 pounds	**$1485**
A Six-45, 2790 pounds	**1785**
A Larger Four-Cylinder with dashing individuality	**1685**
A large, roomy, yet light, seven passenger, high-powered Six, like our former high-priced cars	**2350**

Advanced Catalog "G," containing full specifications, sent on request.

THE FIGHT WITH QUACK GRASS.

How to Battle With the Pest.

PART I.

IN THE ORCHARD.—I noticed on page 1009 an inquiry by W. M. J. of Buffalo, N. Y., as to how quack grass may be eradicated from a young orchard without injuring the trees. It surely is unfortunate that this weed has a hold in the young orchard, for it is very troublesome, indeed, even when it is out in the open, and will be much harder to eradicate, being, as it must be by this time, in among the roots of the young trees. It seems that there must have been some patches of quack grass on the land before the trees were planted and when the meadow was plowed up and the land fitted for the trees, some of the roots were dragged around, and now the whole young orchard is well seeded. In order to eradicate quack grass or any other noxious weed successfully it is necessary to know the nature and habits of the weed and the principles of plant growth. We must know whether the weed is annual, biennial or perennial in order to know how to best combat it. There are so many ways of weed eradication, suited as they are to particular classes of weeds, that this knowledge is essential. For instance, it would be folly to pull out Canada thistles, thinking in this manner to eradicate them. Similarly, fields which are well seeded with wild mustard should not be cleaned up by Summer fallowing—it would be time and money thrown away to do this. The wild mustard is an annual plant, is propagated by its seeds and not roots, and hence the simple pulling of the plants before the seed has ripened is sufficient to eradicate them. It is only necessary to keep any plants from maturing seed in order to finally eradicate wild mustard. But with quack grass, pulling or keeping the seed from maturing would be useless because this weed has other methods of propagating itself than by the seeds.

Wm. Pickering, Photo

HARVESTING A FIELD OF EUREKA SILAGE CORN GROWN ON LONG ISLAND. FIG. 480.

NATURE OF QUACK GRASS.—In its different stages of growth, quack grass may be very easily confused with some other common grasses, namely, Canada blue grass, Red-top, or English rye grass. According to the land upon which it is growing, quack grass grows from one to five feet in height. The leaves are from three to 12 inches long and usually about a fourth of an inch wide. There is one mark on the leaf which will usually distinguish quack grass from any other grasses. About an inch back from the tip of the leaf, there is a constriction running crosswise of the midrib. This cannot always be plainly seen unless the leaf is held up to the sunlight, when the constriction appears darker than the other parts of the leaf. This is regarded by botanists as a sure identification of quack grass, but I have seen leaves upon which it was pretty hard to find this constriction. Another distinguishing feature of the leaves is that they are rough to the touch above and smooth below. The parts of the leaf which clasp the stem (sheaths) are shorter than the distances between the joints—that is, one can always see the joint above the leaf sheath below. The quack grass head is from three to eight inches long and usually one-fourth to one-half inch wide. It is a spike which is hard to distinguish from the

bead of the English rye grass. The distinguishing feature of the two grasses is that the small divisions (containing three or four seeds and called spikelets) on the quack grass are turned flatwise to the main stem, while in the English rye grass, the spikelets are turned edgewise to the main stem. The seeds of quack grass are seldom seen unless one is looking for them. They are rather inconspicuous, being about one-half inch long and only one-sixteenth of an inch wide. They look very much like a miniature oat when ripe, being of a light brown or yellowish color. A close examination of a quack grass seed will disclose a difference between it and an oat; that difference being that the furrow of the oat is more closed than that of the quack grass seed. The roots of the "quacko desperado" are fine and fibrous, and these are sent out from each joint on the underground stem. The roots themselves do not help the plant to spread and they are so fine that they are seldom seen unless the plant is dug quite carefully.

HOW IT SPREADS.—What most people call a quack grass root is really a stem. Take up the so-called root if you will and examine the joints. Joints are seldom found on a true root. Notice the joint carefully and note that a scale is over it. Pull the scale off and underneath will be found a true bud so large that it can be easily seen with the naked eye. Now, if your eyes are good enough, you can pull this bud apart with a pin and will see that it is made up of various miniature leaves. This shows us why a stem always shoots up from one of these nodes on the underground root-stalk. A true bud is there. We expect each bud that we graft into a peach seedling to grow and so the bud that is on the quack grass underground stem, grows whether we expect it to or not. The principle is the same, the bud is the embryonic stem of next year, and is nature's way of stem growth. Quack grass seeds mature early, usually some time in July, and may be cut with the hay or grain and thus the plant may be scattered by the seeds. I have known quack grass to spring up suddenly on a field and cover almost the entire surface in a single season, which showed that the seed must have been in the seeds of the wheat or oats sown on the land. However, probably the majority of the quack grass is propagated by dragging the underground stems around in working the land.

ERADICATION BY SUMMER FALLOWING.—Of the various methods of killing noxious weeds; pulling, spraying with chemicals, cutting, smothering, or Summer fallowing, Summer fallowing is the one which is the surest of eradication of quack grass. This grass stands so thick on the ground that it is impractical to spray with a poisonous spray. This would only kill the top growth and not the roots. It is well nigh impossible to kill a field of quack grass without giving up the crops on the field for at least a single season. In three or four years' time, thorough cultivation in tilled crops will usually nearly kill it, but it would seem best in a young orchard such as W. M. J. has to Summer-fallow the piece. It ought to be plowed this Fall. In an old sod, such as he describes, the roots probably do not grow deeper than two or three inches, or they may grow to the depth of the plowing of last Fall. The depth of growth should be determined and then the plow adjusted so that the bulk of the roots will be turned on the surface. This plowing should be done at once and then the rest of the season cultivate or harrow so that not a leaf can show itself above the surface. Be sure to keep the leaves down around the trees. I should get after it at once, when I can plow pretty close to the trees without injuring them, and there will be less quack to keep down with hand tools. If this orchard is left for three or four years, quite a growth will have been made. This will necessitate working with horse power farther away from the trees and so a larger amount of hand labor will be required to keep the grass down, but worst of all, the quack grass roots will be so grown in around the tree roots that it will take two or three seasons entirely to kill them out. J. J. MATHEWS.

CONCRETE BOXES.

THE concrete boxes shown in Fig. 485, are handy for many uses about barn and henhouse. The forms used for making such receptacles are two second-hand store boxes, one several inches smaller than the other. The smaller box has two wooden strips nailed across the top, long enough to project across the larger or outside box, thus suspending the inside form so that it will not sink into the fresh concrete at the bottom.

After this first or bottom layer of concrete is placed, the space between the sides and ends of the two boxes is filled with concrete and the result will be a box of concrete of the dimensions represented by this space. If great strength is required, wire or small steel rods may be imbedded in the concrete as it is built up, which will reinforce it to the degree that it will be very much stronger than plain concrete. On the other hand, if a porous concrete is required, that is to say one which will admit moisture, it may be made of cinders with the quantity of cement and sand somewhat reduced. This is known as a lean mixture. A satisfactory mixture for work of this kind would be a concrete composed of one part Portland cement, two parts sand and four parts stone or gravel. When placed in the forms it should be thoroughly tamped and worked from side to side with a flat paddle. This will bring the richer mortar to the sides of the form, making a smoother surface than would otherwise result. The concrete should

Wm. Pickering, Photo

LONG ISLAND CORN THREE STORIES HIGH. FIG. 481.

be of "sloppy wet" consistency. It should be protected from the hot sun and wind and kept in the forms several days, after which it should be sprinkled twice a day, or, if the object is small, immersed in water for the period of a week.

By the use of a dense and impervious concrete, reinforced as described above, but especially at the corners, the forms will answer for a small tank or watering trough. Where tanks are to be placed in exposed situations subject to freezing, it would be well to slope the inside form by making it a little smaller at the bottom than at the top, thus providing an inclined interior surface upon which the ice will tend to slide upward, thereby preventing the destruction of the tank. It is said, however, that the placing of a stick in an upright position in a receptacle of this character will prevent it from bursting in cold weather. With pipe openings established, these box forms are available for the construction of a kitchen sink or slop drain, as well as a drain for an outside pump or faucet. It would not be a difficult matter to establish them in the horse or cow stalls for mangers or small watering troughs.

In using old boxes in the manner described it must be understood that the chief object in view is to do the work as cheaply as possible. In a majority of cases, unless the boxes were perfectly smooth and oiled or soaped before the concrete is put in, it would be necessary to destroy them in removing them from the concrete.

A LONG ISLAND CORN FOREST.

WHERE is the man who has said that Long Island cannot be made into a dairy section, or that the Long Island soil is so poor that it cannot produce good crops of corn? We have heard men talk in that way. We would like to get hold of one of them this Fall and lead him into the cornfield which is pictured at Fig. 480. We would make him change his mind, in case he had any mind which had growth enough in it to make such a change possible. The photographs were taken on the Old Brick Farm at Roslyn, L. I. Mr. Taber-Willetts brought us these photographs to show what Long Island soil can do when properly fed and cared for. The corn is Eureka. It was planted in drills about three feet apart, and has been given the most thorough culture possible. Of course Mr. Willetts did not pick out a sand bank, or a piece of beach sand thrown up by the sea, and plant this corn without any manure or fertilizer. He has a large dairy farm where high-class milk is produced. The soil is typical of Western Long Island. It has been farmed for many years, and was producing good crops when the soil in the Mississippi Valley was doing nothing but supporting buffaloes and other wild animals for the benefit of the Indians, or a few wandering white trappers.

The corn was planted on an old Alfalfa field. This Alfalfa was reseeded last year, but the crop was not very satisfactory, or as good as they wanted, and so this Spring they plowed the new seeding under. First they put on a thick coating of cow manure. When we asked Mr. Willetts how many tons they used, he said they just opened the manure spreader wide and let it go. This manure with the Alfalfa sod was plowed under, the ground well fitted, and the corn drilled in, using 400 to 500 pounds of corn fertilizer in addition to the manure. As is well known, such a corn fertilizer is usually not high in nitrogen, but is rich in phosphoric acid and potash. In fact the object of such a fertilizer is to act as reinforcement for the manure. As the corn came up it was kept clean of weeds, and the surface was kept thoroughly stirred with cultivator and hoe. We see the result of all this work and feeding in the mighty forest which is shown in the picture. The single stalk pictured with men beside it gives a good comparative idea of the way this corn has grown, and do not get the idea that there is only a small back yard or playground piece of this corn. Mr. Willetts has about 70 acres of it, which would put the cornfield right in the same class with the big Western growers through the Middle West.

This corn will be used to fill the silos, while the over-run will be stacked for feeding as dry fodder through the Winter. There are not silos enough on the farm to contain it. The argument between farmers who grow this immense corn like Eureka, and those who grow the smaller corn with a larger mature ear, is an old one. The big corn men want a silo filler,—the others want quality, as they say, rather than quantity. A silo filler can be helped out with cottonseed or linseed meal, while the quality corn does not require so much grain. It is an old argument which we need not take up here, but the point we want to bring out now is the fact that Long Island soil when properly handled in this way, becomes as productive in corn culture as any other soil on the Western Hemisphere. There are so many people who seem to have an idea that Long Island is a dry, barren desert, that we are very glad to show this forest of corn as evidence of what comes out of the desert when man knows how to make it come.

THE POTASH SITUATION.

IN view of the impossibility of importing potash from Germany while the war lasts, what advice can be given Eastern farmers about the use of fertilizers? Is it not probable that most of our soils contain enough potash so that a failure to use it for one or more years will not seriously affect crops?

Of course, no one definite answer can be given with safety. On soils which are of a marked clay type, I should imagine the potash could be omitted or lessened for a few years without very serious difficulty; indeed, there are those who hold that we are now overdoing the use of potash. However, on some sandy soils, and particularly for such crops as tobacco and potatoes, and some of the root crops, I should expect that a potash shortage would be evidenced rather promptly by decreased yields. Of course, as you suggest, lime might be used temporarily to set free potash, provided the crop was of such a character that lime would not work an injury. The situation is certainly a serious one, and

there seems no ready solution. I imagine it will result in our fertilizer manufacturers this coming year reducing to a minimum the potash content of their goods. It is interesting to notice in this connection that the commercial fertilizers as sold in the early days contained little or no potash. I have in my hands an article by Peter Collier, issued in the Vermont Agricultural Report for 1872. This article discusses commercial fertilizers and contains the

A COVER CROP OF RYE. FIG. 482.

analyses of 28 samples drawn that year. They were apparently all the commercial fertilizers then sold in Vermont. The analyses were made before there was any State fertilizer law. Now the particular point is right here: that only three of these contained potash—two of them containing less than 1 per cent. potash and one (a tobacco fertilizer), 3½ per cent.; three of them were fakes; the rest of them were all fairly good materials. Furthermore, our records, running back consecutively as far as 1884, show the average fertilizer sold in Vermont prior to 1887 carried less than 3 per cent. potash; and that in only three years, between 1887 and 1894, did its average exceed 3 per cent. and then only by one-fourth of 1 per cent. Now our farmers in those days grew crops, and without very large artificial potash feeding. In the last 20 years there has been a great deal of potash put in Vermont soils; much of it has been used, some of it has probably passed into drainage waters, but I am inclined to believe our soils have as much available potash as they had in the 80s and 90s, and that Vermont farmers won't suffer frightfully if the potash rations for their plants are for the time being lessened. J. L. HILLS.

Vermont Exp. Station.

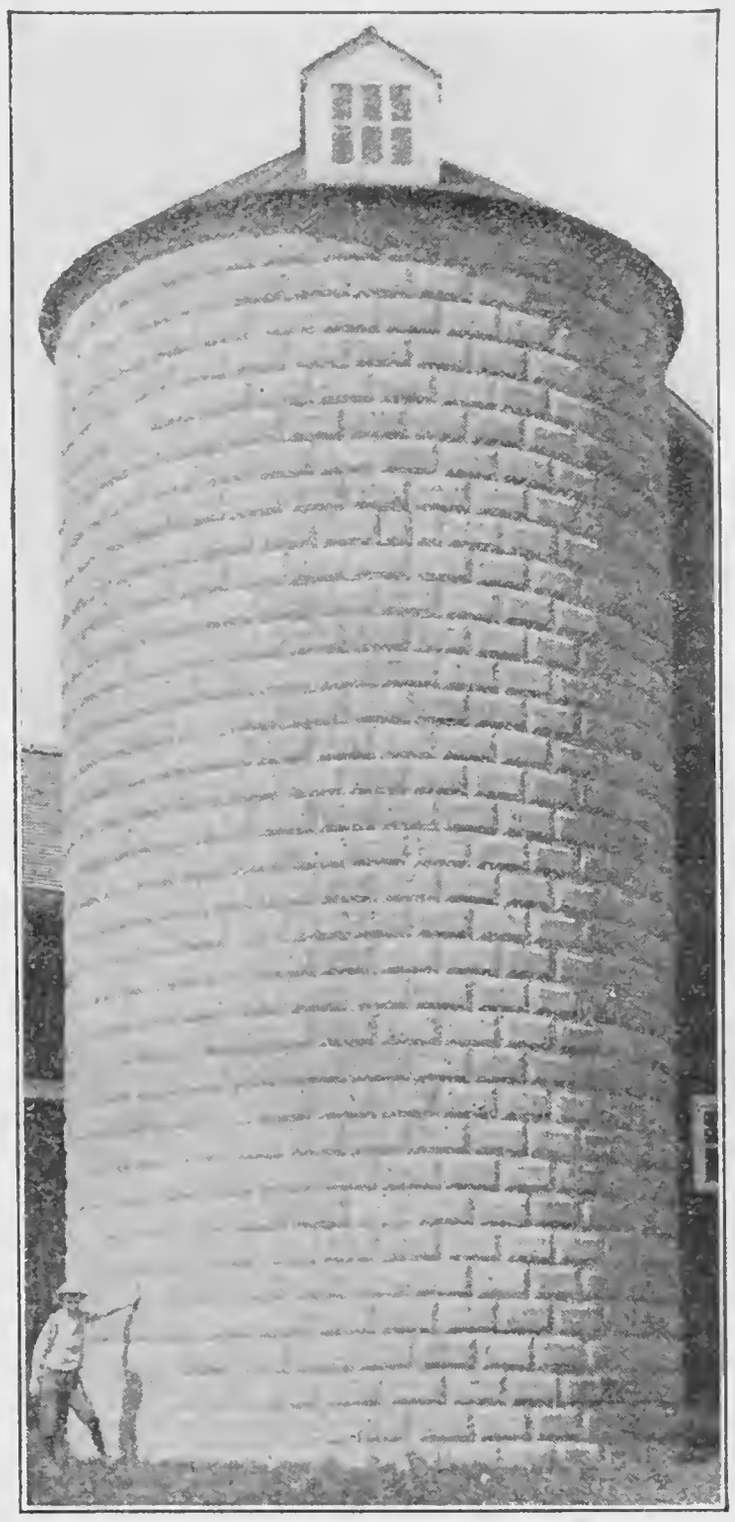
PLOWING UNDER GREEN CROPS.

CAN you tell me how to attach chain to plow, in order to turn under a green crop? I have buckwheat to turn under and wish to try the chain, but am at a loss to know how to attach chain to make it do what it is theoretically intended to do. If you answer this inquiry please give explicit details, as to length of chain, size of links and a sketch of how chain is applied to plow. In these days we read in farm papers about how to farm, written by those who have never been off Manhattan Island, like articles on how to raise and train children are written by old maids. C. E. C.

Wallkill, N. Y.

We agree with the statement that people who have least experience with children are the ones who tell us most about how to bring them up. That seem to be one of the privileges which belong to the childless character. Very likely much the same thing is true in giving farm advice. We know that rarely a day passes that we do not receive a letter from some man who says that he has seen certain advice in a farm paper, but before he spends his money in following it, he would like to know whether it is sensible or not.

The best we can do with this plow and chain proposition is to print a set of photographs showing how we do it on our own farm. Fig. 482 shows a growth of rye in a peach orchard. Each year we have a growth of rye, or rye and vetch, as a cover crop. We let it grow shoulder or head high before turning it under. It was a dull day when the photograph was taken, but the comparative height of the rye is indicated in the picture. Fig. 483 shows as well as we could with a photograph how this rye was turned under. As will be seen, a heavy chain is fastened with one end at the whiffletree, and the other end at the back of the plow beam. This chain is long enough to drag over the ground in the form of a loop, and it is large enough to give a heavy weight. This chain dragged the rye down flat, and held it there until the furrow slice was turned over upon it. The chain must be regulated in length so as to give the proper drag or twist to the rye, and a



CONCRETE BLOCK SILO IN NEW YORK. FIG. 484.

little experimenting will be necessary to adjust it properly. If the chain is too short some of the rye will spring up before the furrow slice is turned over upon it, while if it is left too long the soil tumbles over upon the chain and does not fully cover the rye which stands in front of it. This is a matter for adjustment to suit the plowman, as a chain of a different length would be necessary in plowing under buckwheat, since that crop is shorter than this tall rye. Fig 485 shows the appearance of the field after this rye was turned under. There is practically nothing of the rye to be seen above ground; in fact one who has never seen a crop turned under in this way would be surprised to see what a thoroughly clean job a good plowman can make. It all comes in the study of the chain, and having it lengthened or shortened so that it turns with just exactly the right kind of loop to bend down the crop a trifle in advance of the turned over furrow.

CHAIN ADJUSTED FOR TURNING UNDER. FIG. 483.

A TEMPERANCE wave has struck some sections of rural England and there is opposition to the beer or hard cider formerly served in the harvest field. Tea and bread and butter are substituted.

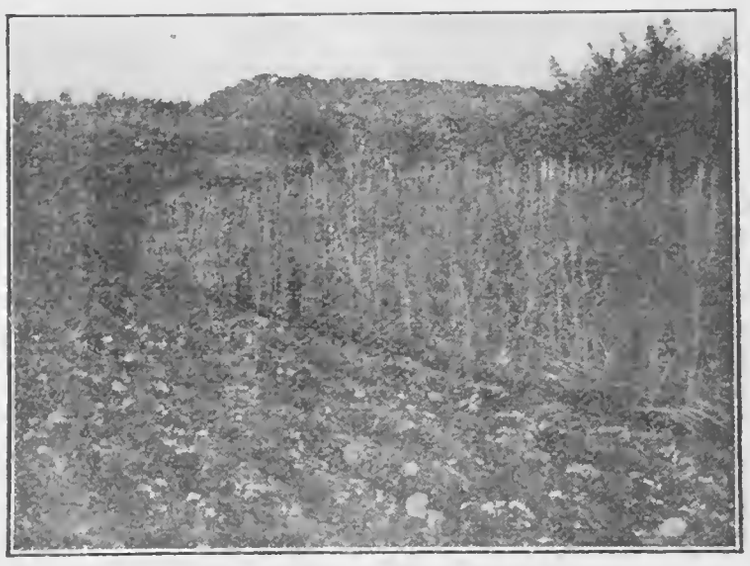
A CUBIC foot of corn silage will average about 40 pounds in weight. Remember this in figuring the size of a silo. Figure 30 pounds per feeding day for a cow and allow for 10% waste.

SWEET CLOVER IN MARYLAND.

I FREQUENTLY see articles in the papers giving enthusiastic accounts of success with Sweet clover. One would think to read such articles that this Sweet clover will change the farm like a miracle. Before we plunge on such things we want cold advice. What does this clover really amount to in Maryland?

J. M.

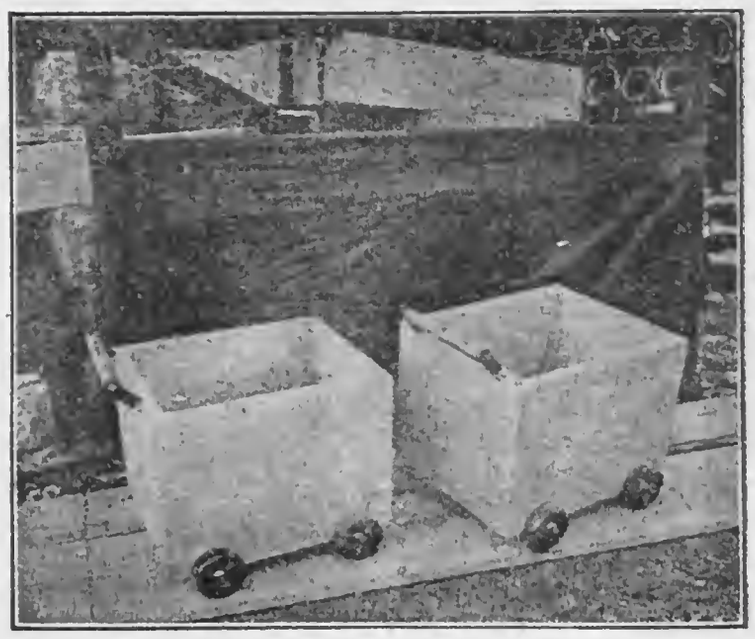
As to the value of Sweet clover for pasture, hay and silage in this State, I have seen a number of articles describing at length, the value of Sweet clover, including one in Hoard's Dairyman. No doubt, a number of these accounts are founded on facts, and in some sections, I believe that Sweet



RYE UNDER OUT OF SIGHT. FIG. 485.

clover has proven a useful dairy feed. Our experience in this State, however, indicates that Sweet clover requires more than ordinary care to secure a perfect stand. The argument is offered that we see Sweet clover growing on the sides of railroad cuts and on rough pieces of land where apparently nothing else will grow. For some reason or other, certain stretches of land of this sort as well as those of more productive character, seem well adapted to the growth of Sweet clover. However, when we come down to trying it as a commercial crop, we find that, like other crops of the same sort, it requires certain favorable conditions, including the proper inoculation of the soil.

The writer attempted to seed Sweet clover three successive years on a small patch of poor land on his place, without any attempt at inoculation or special preparation, beyond getting the ground in fair condition. As a result, owing in one case to a severe drought, the clover failed to make a good stand, and in only one field does it appear to be making any special growth. In consequence, I am inclined to think that it requires the same care and inoculation to seed Sweet clover that it does to put in Alfalfa and other leguminous crops, and that a dairyman would better seed his land to either Alfalfa or some more improved crop, as long as he must go to the same amount of trouble to get a good stand of Sweet clover. I have not as yet found that cattle like it as well as Alfalfa or some of our other clovers, and the hay is coarser than is desirable for getting the most out of it. I do not believe that it is going to work any miracle in regard to dairying or any other branch of production in which improved hay is a necessity. I believe that in some localities where it is well adapted to conditions, it may prove valuable as a supplementary crop, and also where it can be grown on an otherwise unused piece of land as pasture for bees. One point is certain, Sweet clover is no better than our other leguminous crops for a dairy feed, and except in certain localities, is just as hard to seed successfully and get a good stand. REUBEN BRIGHAM.



CONCRETE BOXES. FIG. 486.

THIS stern command must come to all—a hard unyielding fact—"*Stand up and take your medicine—don't play the baby act.*"

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Peaches for Massachusetts.

I HAVE about three acres I would like to plant in peaches next Spring. The land lies high, soil stony clay loam, medium crop of oats was taken off this Spring. The land has a gentle slope to south and west, well drained and has good air drainage, partially protected on north by wind-break; location southern Massachusetts. What varieties of peaches will do well here? There are about a dozen peach trees near by that appear to be affected with yellows and borers. Would it be economy to dynamite when planting? How much dynamite should be used? L. W. J.

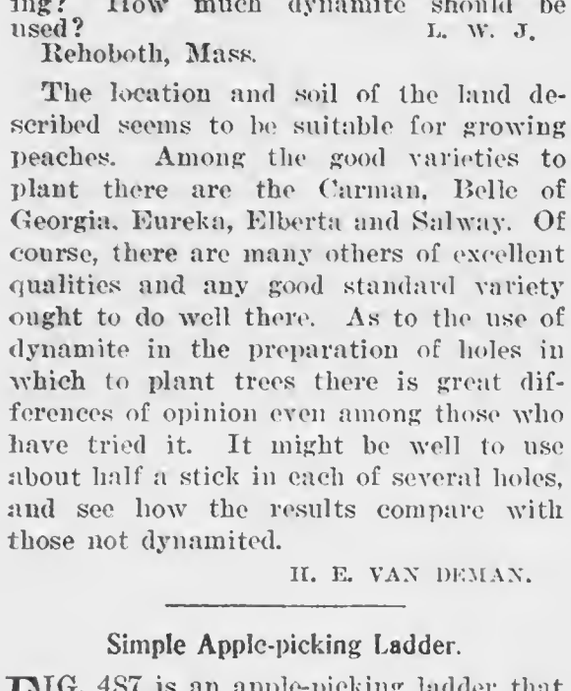
Rehoboth, Mass.

The location and soil of the land described seems to be suitable for growing peaches. Among the good varieties to plant there are the Carman, Belle of Georgia, Eureka, Elberta and Salway. Of course, there are many others of excellent qualities and any good standard variety ought to do well there. As to the use of dynamite in the preparation of holes in which to plant trees there is great differences of opinion even among those who have tried it. It might be well to use about half a stick in each of several holes, and see how the results compare with those not dynamited.

H. E. VAN DEMAN.

Simple Apple-picking Ladder.

FIG. 487 is an apple-picking ladder that is simple in construction and satisfactory to use. The chief difference between this ladder and the ordinary step-ladder



FRUIT PICKING LADDER. Fig. 487.

lies in the fact that the single back brace swings from side to side, thus allowing its use against a hillside where the ordinary ladder will not stand up. This is accomplished by bolting this back brace loose to cross piece B, which turns freely at the ends, thereby allowing the ladder to be set at any angle to suit the user. This back brace is also from eight inches to a foot or more longer than the main part of the ladder. This makes it possible to use this ladder on the upper side of a tree which is not possible with the ordinary step ladder. All the timber used in making this ladder is 2½ or three inches wide by one inch thick, thus making its manufacture very simple and inexpensive. No feature of this ladder is patented, so they can be made and sold by anyone. The first one made so far as I know, was made by H. L. Hill of Washington Co., Va. I have used this ladder on rough land, and urge growers to make up a sample and note its advantage. It can be made of any desired length up to probably 10 feet, and may be used as an ordinary ladder by simply unbolting E from B. G. C. STARCHER.

Virginia.

Michigan-grown Vetch Seed.

ON page 986 H. C. Hilton of Southwestern Michigan, claims that sand vetch grown for seed in his part of the State does not do well; that it is shrunken and not good for seed. Herewith I am sending you a sample of some vetch seed grown about 40 miles from Mr. Hilton's place. This seed is from that grown three or four years on the same farm, and if there is any deterioration it should be evident in this seed. This is a sample of that grown over an area of 60 or 70 acres which was raised expressly to sell for seed. It is possible that Mr. Hilton's observations of this crop may have been limited. It may be regarded as unusual that a plant that maintains the qualities of a weed, remaining in the ground and reproducing in a wheat crop for years, should be lacking in vitality. It is for this very reason that growing it on farms where wheat is a part of the rotation is discouraged. The writer is acquainted with an orchard where vetch was introduced over a narrow strip of ground for a cover crop, and in the course of three or four years was spread over the entire orchard of several acres. The ground was plowed each Spring, but enough vetch remained above the furrows to go to seed, and was spread by the harrow until the whole was thoroughly seeded.

It is frequently, perhaps generally, the case that vetch does not do its best on a piece of ground the first or second year. Vetch is a legume, and in order to reach its highest development must have its peculiar nitrogen-gathering bacteria present in the soil in order to thrive as it should. These may be expected to be lacking in ground which has never grown a vetch crop, and unless supplied artificially do not at first gain access to the soil and vetch roots, and some little time may be required for these to become sufficiently abundant so that the vetch plants may become supplied with them. This will no doubt require a longer time in ground that is lacking in fertility than in that which is richer in the elements of plant food. Vetch more readily gathers its specific bacteria naturally than some of the legumes, such as Alfalfa or the clovers, but it is probable that where first sown on a piece of ground better success would be gained from the start if the seed were artificially inoculated. It is possible that Mr. Hilton's observations may have covered some fields which had not become sufficiently inoculated to permit of the highest development of the plants.

Allegan Co., Mich. EDWARD HUTCHINS.

R. N.-Y.—The seed enclosed was certainly plump and good. We should call it high quality.

Tomato John Baer.

W. F. MASSEY states that John Baer tomato was the monumental humbug of the season. While I do not hold any brief for John Baer or the distributors of the seed, nevertheless I wish Prof. Massey could have seen the 6,000 plants of the variety I had growing. The seed was sown four weeks later than our Bonny Best and Earliana. The tomatoes started ripening about four days later than Earliana and same time as Bonny Best. The crop was just about half again as heavy per plant as either of the other two varieties, and the fruit infinitely superior to Earliana, and larger in circumference, though not quite as deep as Bonny Best. Our soil is a heavy clay underlaid with limestone, which may account for the difference, though this experience, or rather diversity of results, only emphasizes the fact that no one is justified in giving either unqualified approval, or disapproval to any novelty upon one trial in one place.

ELMER J. WEAVER.

Dwarf Peach and Pear Trees.

I HAVE a few standard peach trees that are being gradually destroyed by borers. Try as I will they go, one by one. I am now thinking about replacing them with dwarfs (peaches on plum stocks). Can you tell me if dwarfs are fairly productive and long lived? For home use what varieties are preferable, say about three sorts, early, medium and late freestone? 2. Do the Bartlett and Sheldon pears do well as dwarfs? My space is very limited. J. F.

New Rochelle, N. Y.

1. There is no really good excuse for letting the borers destroy a few peach trees on a town lot, for they can be dug out in a few minutes if given timely attention. Or they can be kept out entirely by the use of a wire gauze collar about the base of each tree, which would cost but little. There is no such thing as a really successful dwarf peach tree. Those on plum stocks are not practical because the two woods are not congenial and the tops often break off after they get large. Three good varieties of the peach in order of ripening, for family use are the Triumph, Carman and Salway. I would get good trees on peach roots and take care of them faithfully and there need be no fear of failure. 2. The Bartlett and Sheldon pears succeed very well as dwarfs, and will bear at an early age, but by planting so deep that roots will form above the point of union with the quince stock the vigor of the trees will be increased. However, this may not be desirable in a small place.

H. E. VAN DEMAN.

TRANSFERRING BEES.—If Mrs. F. G. S. lives in a locality like ours and would take M. B. D.'s advice regarding the transferring of a swarm of bees, I feel pretty confident there would be no live bees next Spring. That method would be satisfactory where there is a Fall flow from buckwheat or some other Fall flowers, but we must depend entirely on clover, which usually ends July 1 to 15. In transferring we have usually turned the old box upside down before drumming the bees out, as the old hives usually have only a few small holes in the top, while the whole bottom is easily removed, and bees, including the queen, are much easier to get started into the new hive. After drumming the bees into the new hive a queen-excluding honey board is fitted under the new hive, and then it is placed on top of the old one and left on the old stand. At the end of 21 days break the old hive up and place the mutilated combs, so bees can have access to them at night as they will need all that honey to Winter on. When you remove the old hive do not remove the queen excluder from under the new hive until you are sure there was no virgin queen hatched in the old hive. Try to find her and kill her. This occurs quite often, and a virgin entering a hive will usually kill the laying queen. There may be occasions where the old queen would best be killed, but a virgin reared under above conditions would usually be worth very little. If foundation were used in the frames of new hive and no honey coming in, heavy feeding would have to be resorted to, using sugar and water in equal portions. The better plan would be to wait till the start of a honey flow. Allow 25 to 30 pounds honey November 1 to winter on. ELMER J. WEAVER.

Why Don't YOU Plant Pear Trees THIS Fall?

You are not as busy as in spring; fall planting is safe, and the trees are ready to grow the first warm days.

I have the finest lot of Pears you ever saw — Duchess, Wilder, Bosc, Bartlett, and others. Trees are big, clean, healthy, splendid roots — the kind of trees the careful planter buys.

Fraser's Tree Book will help you to select the profitable Pears, Apples, Cherries. Write for a copy today.

The Home Acre.

NOTES FROM A MARYLAND GARDEN.

IT is rather discouraging to write about gardening under present conditions. May and June were intensely dry, but the first week in July gave us some nice showers, and we thought that the worst was over. But here is August 20, and we have had no rain to amount to more than a good dew since July 7. The soil is dry through and through, and it is useless to put seed in this sun-baked soil. I have a piece of ground stuffed with manure in which I intended to sow seed for the Fall crop of spinach early this month. But the seed is still in the sack, for it would simply cook it to put it in the soil. The early tomatoes have finally played out, and while the late ones still manage to keep green they are setting small fruits stunted for lack of moisture.

The last planting of sugar corn tasseled out in its piped-up leaves when two feet high, and is now drying up. By sowing in a frame and covering with a gunny sack I have managed to get some lettuce plants started by using the hose on the sack. For this Fall crop I use home-grown seed of the May King, which heads more quickly than the Big Boston, which I sow later for the frames. We manage to keep the lawn green and the flower beds watered with the hose, but it is a hopeless task to drag a hose all over the garden, even if it was long enough. The fact is that these dry seasons seem annually to grow worse, and we must adopt some reliable system of irrigation, for we are now as dry as California. I am planning to put in the Skinner system of overhead watering for another season if the city water company will allow me water at a reasonable cost. If not, we can drive a well about 20 feet and get all the water we want with a gasoline engine or a windmill and tank. On our low lands it is easy to get a flowing well at about 100 feet, but whether we could get a well to flow on the higher land is doubtful. One bored recently on the low land to a depth of 107 feet flowed 16 feet above the surface, and it may be possible by going deeper to get one to flow on the uplands which are not here many feet above this.

We had a splendid bloom on the Gladioli, of which I have a plot of 2,000, but it looks as though the corms are ripening up untimely. The greatest show bed I have now is one of the feathered cockscomb called Pride of Castle Gould. These are wonderfully gay, and being in reach of the hose, are kept flourishing. The scarlet sage too is showy. I have the variety called Zurich, which is dwarfer and more early and prolific in bloom than any Salvia I have yet tried. I formerly grew the Bonfire variety, but find the Zurich better. While the plants are comparatively dwarf, the flower spikes are unusually long.

In the shrubbery border the only thing now giving bloom is the Rose of Sharon, Hibiscus Syriacus. I have the double-flowered one with bloom of the old rose color, a double white with purple base to the petals, and one pure white. In spite of the drought these are covered with bloom.

Meehan's Marvel mallows made a wonderful bloom, but are now about done, but the foliage still answers to hide an ugly board fence. Perennial Phlox are blooming, but look as though it is to be their last, for there is little new growth starting from the base of the plants set this year. I have 250 of these planted last Spring, and I fear that there will be many of them lost entirely, simply exhausted in blooming and no new growth starting.

Having over 100 plants, seedlings of Asparagus Sprengeri, I planted some as a border to a flower bed, and of all the things in the garden these have withstood the drought best. In a porch box I planted these along the front and filled back of them with Begonia Vulcan, and the box has been a wonderful show all Summer, as the porch awnings shelter it from the direct sun and we water it of course. The asparagus plants in the border I intend to leave out, and find out whether these ornamental kinds of asparagus are hardy like our edible sort. If they are we will have found out something valuable. It has been a hard Summer on the Cannas, and if one should try to give the height of the varieties from this season's growth he would class all of them as dwarfs.

As soon as we have rain enough I shall sow seed of the Phlox Drummondii for next Summer's flowers. I find that they winter well and bloom earlier and fully as long as those sown in Spring. In fact I once had a plant to bloom in a mild January.

The new Cardinal Climber I have on a wire fence 50 feet long, and it is gay with its scarlet flowers in the morning, closing up in the afternoon. One has to look very closely to find any seed pods, for unlike its parents, the Cypress vine and the scarlet morning-glory, it is a very shy seeder, and the seedsmen have been putting only 17 seeds in a 25-cent paper. I hope to spare them some seed this Summer.

An order for some thousands of small bulbs of Candidum lilies from the North of France have not come, and I fear will not get here, and I shall have to depend on my own stock alone, and as the Northern seedsmen took the bulk of my bulbs last year I have been running short. We grow this lily here as well as the imported ones, and it is only a question of time when they will all be grown here.

Maryland. W. F. MASSEY.

Runners from Non-bearing Strawberries.

REPLYING to G. F. H., page 991, he will be perfectly safe in using runners from non-bearing plants. Forty-four years ago I planted an acre of strawberries in a bearing orchard that had been in sod 15 years. When plowed the sod ws so tough that there was a hollow place under each furrow except where it was closed by the horses' feet in harrowing. All the runners that rooted over those hollow places failed to blossom the next year, as such always do. From this bed I took up a large number of plants the following Spring when the bed was in bloom, and, as a matter of economy, the non-bearing plants were chosen. These were all planted for hill culture and it proved to be one of the most productive beds I ever raised. Runners produced so late in the Fall that they go into Winter quarters with roots only an inch or two in length usually fail to bear the following season, but they make plants in abundance—and good ones, too.

Summit Co., Ohio. M. CRAWFORD.

Winter Onions.

I HAVE a piece of ground about 100 feet long, 50 feet wide, which I would like to put to onions for early Spring market. Let me know when and how to plant, variety and Winter protection.

Hazel Green, Wis. E. K.

In South Jersey the Egyptian top onion makes the best bunching sort for early Spring. Sets are planted from one to two inches apart in rows 12 to 18 inches asunder and they should be planted six to eight weeks before the ground freezes. Here no Winter protection is required. Where Winters are severe a mulch of straw or preferably strawy manure should be applied after the ground freezes. For Southern growers the white or yellow Multiplier onions would be best. These Multipliers are quite generally used in the South, while the Egyptian is given first place in the North for Fall planting. The Multipliers should be planted at least six weeks before freezing. Ground is usually furrowed out four or five inches deep and the bulbs set three to four inches apart in the row. Where Winters are severe a mulch should be used as described above. TRUCKER, JR.

IRRIGATING STRAWBERRIES.—On page 993, S. B., Indiana, asks about a system of irrigation that is successful and practical in raising strawberries. We grow fine strawberries by surface irrigation in a country where there is but little rainfall. Make shallow ditches between the rows and allow the water to seep to the roots of the plants. Flooding must be avoided, as it would cause the soil to crust and do more harm than good. Gooseberries, raspberries and currants are a success when irrigated in this way. MRS. B. C. FAY.

LEARN THE AUTOMOBILE BUSINESS

Learn by Practise

PICK OUT A GOOD JOB—Chauffeur, $65 to $125 per month; Mechanician, $90 to $150 per month; Road Tester, $75 to $100 per month; Shop Foreman, $125 to $200 per month; Salesman, Salary and Com., $150 to $300 per month; Garage Manager, $150 to $200 per month; Racing Driver, Salary and Prizes, $200 to $500 per month; Stationary Gas Engineer, $100 to $200 per month; Tractor Engineer, $5 per day and upward. Our course of practical instruction will fit you for it. Write for details. **NEW-WAY AUTOMOBILE SCHOOL, 1016 Broadway, Brooklyn, N. Y.**

Hardwood Ashes BEST FERTILIZER IN USE. GEO. L. MUNROE & SONS, Oswego, N. Y.

35 ACRES—Two-Story 9-room house, painted and papered; 3 large hen houses; capacity, 600 hens; 80 apple trees; pears, cherries, peaches, grapes; barn, 30x40; ½ mile church, creamery, school. Included to quick buyer—pair horses, harnesses, wagons, top buggy, plows, harrow, a lot of tools. All for $1,350; $800 cash; balance, time. **HALL'S FARM AGENCY, Owego, Tioga Co., N. Y.**

150 Farms FOR SALE—near Phila. and Trenton markets; good railroad and trolley facilities. New catalogue. Established 25 years. Horace G. Reeder, Newtown, Penna.

"DEYO"

There's an inborn satisfaction in driving a spanking team that no neighbor can touch. Just as there is in having a big, strapping, good looking son to follow in our footsteps.

AND IT'S JUST THE SAME ABOUT A

Deyo Portable Engine

GIVES ABSOLUTE SATISFACTION

You know you've got the best farm engine that can be built and that you have not paid too much for it, either. Your "Deyo" is always in order, because it's made on a reasonable model and works day in and day out without perceptible wear. Every farmer who hasn't an engine or who has an engine that is unsatisfactory is invited to write today for our illustrated booklet. Tell us your acreage and we'll mark the number "Deyo" best for you. But write today sure.

EVENTS OF THE WEEK.

DOMESTIC.—Although information reached the War Department August 31 that the employment office of the Anaconda Mining Company at Butte, Mont., had been dynamited, Gen. Wotherspoon, Chief of Staff and Acting Secretary of War, sent a definite refusal to the request of Gov. Stewart of Montana for Federal troops to be sent to preserve order in the mining district. Gov. Stewart also forwarded the request for the Federal soldiers to President Wilson at Cornish, N. H. The Governor is alarmed because of kidnapping alleged against certain leaders of miners, and information that has come to him that the miners are heavily armed and are ready to raze the city if the State interferes. Gen. Wotherspoon's reply to Gov. Stewart's appeal was that he did not believe it would be expedient to send Federal troops until the State had exhausted its own means. The trouble is a fight between rival labor organizations—the Butte Mine Workers' Union seeking to sweep the old organization, the Western Federation of Miners, out of the Butte district.

Tolls of the Panama Canal during the first week of its operation amounted to only about $15,000. The cause is said to be the European war. The amount received not only fell below the expenses of operating the canal for the week, but was not sufficient to pay the interest on the capital invested. The officers of the canal are not disappointed at the showing and predict that with the reopening of commerce, which has been interfered with by the war, business will boom and receipts will mount up to a point that will be satisfactory. Prof. Emory Johnson estimated that the tolls would yield near $25,000,000 in the first two years of the canal's operation. Canal officers believe that soon much commerce will be passing through the canal under the American flag and under the flags of other neutral countries.

Dr. Arthur Mudra, German Consul at Philadelphia, called the attention of William H. Berry, Collector of Customs at that port, September 1, to the fact that the American Line steamship Merion, which flies the British flag and arrived there from Liverpool and Queenstown, had four six-inch guns mounted on her decks. Collector Berry has referred the question to Washington.

Seven miners, including Peter R. Stewart, former president of the Arkansas, Oklahoma and Texas district union, United Mine Workers of America, were found guilty of contempt of court by Judge Youmans in the Federal Court at Fort Smith, Ark., September 1, and sentenced to serve from 30 days to four months in jail. Stewart received a four months' sentence. The men were charged with being implicated in the riots which occurred in the coal fields near there several months ago after the operators had obtained an injunction to prevent their interference with the operation of the mines.

The main plant of the Carstens Packing Company was destroyed by fire at Tacoma, Wash., September 1, entailing a loss estimated at $700,000 to $1,000,000. Hundreds of cattle, sheep and hogs were run out of pens and saved.

The National Highways Protective Society's report issued September 1, states that 53 persons lost their lives by vehicular accidents in New York streets in August. Twenty-six were children under 16. Automobiles killed 29, wagons 13 and trolleys 11. Of the children killed, 14 met death by automobiles, 10 by wagons and two by trolleys. Most of the fatalities occurred on Sundays. Fourteen persons were killed at railroad grade crossings in the city and vicinity in August.

Six arrests were made at Trinidad, Col., September 1, on indictments returned by the Grand Jury investigating coal strike disorders. Those arrested are William Diamond, International Organizer of the United Mine Workers; three saloon men and two strikers. The six are charged with murder on several counts growing out of the battles between strikers and mine guards in last October and April.

WASHINGTON.—The armored cruiser North Carolina, now at Falmouth, England, has been ordered to Turkish waters to relieve the Americans stranded there and also to guarantee their personal safety in case Turkey becomes involved in the present European conflict.

The seaman's bill was passed August 27. This bill, in a more drastic form, passed the Senate a year ago. In order to frustrate efforts made to strengthen the restrictive features of the measures the leaders were obliged to bring it in under conditions that prohibited the offering of amendments.

Great Britain, France and Russia have advised the United States informally that they would look with disfavor on the purchase by this government of German merchant steamers to relieve conditions growing out of the European war and also to build up an American merchant marine. While not conveyed in any diplomatic correspondence, their position, nevertheless, has been vigorously set forth to President Wilson and Secretary Bryan.

FARM AND GARDEN.—The National Association of Live Stock Insurance Companies, organized at a meeting of representatives of 10 live stock concerns at the Hotel Severin, Indianapolis, recently, elected J. W. Newman, of Louisville, Ky., president, and John B. Rice, of Bloomington, Ill., secretary and treasurer. Newman is president of the Kentucky Live Stock Association. Rice is secretary of the Granite Live Stock Insurance Company.

The heavy demand for horses and mules suitable for army purposes for nations engaged in the European war, has caused prices to advance until they are from $5 to $100 a head higher than a year ago, it was said at the Chicago stockyards September 1.

Apple-growers of the Valley of Virginia are planning to organize a co-operative marketing association to be operated along the lines of the Georgia Fruit Exchange, which has proved such a great success in enabling the Georgia peach-growers to get the best prices for their fruit through scientific marketing methods. On account of the uncertainty as to the export market which has formerly taken a large portion of the Virginia crop, the valley growers are looking to the Southern markets, and the Southern Railway, through its marketing department, is endeavoring to aid them in getting in touch with reliable dealers, and in every other possible way. It is expected that 1,150 cars of apples will be shipped from the valley this season.

THE EUROPEAN WAR.—August 28 the Germans captured Longwy, on the Luxembourg frontier. It is asserted that the Germans practically destroyed the Belgian city of Louvain, famous for its art treasures and architecture, in reprisal for alleged attacks by non-combatants. Shocking accounts are given of the slaughter of the inhabitants. August 29-September 3, the Allies were pushed back by the Germans, who continued to advance, and Paris was being prepared for a state of siege. The Germans had not then succeeded in breaking through the Allies' line, and were making a crushing onslaught on the British forces. The Germans were then within 27 miles of Paris. There were further reports of bombs from German airships dropping in Paris. September 2 the capital of France was moved to Bordeaux, 358 miles southwest of Paris. In a battle at Compiegne the British captured 10 German guns. Reports from Eastern Prussia continued to be conflicting August 28-September 2, the Russians claiming successes, which were denied by the Germans. Russia has so many men that she is ordering some of them home. The Czar has given a six weeks' leave of absence to 500,000 reservists of the 1907 class. Serious trouble seems imminent in the Balkans. It is stated officially that the Bulgarian Government is pledged to join with Greece, Roumania, Servia and Montenegro as allies of Russia, and against Turkey should the latter decide to become an ally of Germany and Austria. The Bulgarian army is partly mobilized and is to be put into the field at once. Messages from Constantinople say that the Turkish army and navy are ready for action and that on most of the Turkish warships are strong contingents of German sailors and officers. August 28 it was announced that the German cruiser Kaiser Wilhelm der Grosse, formerly a North German Lloyd liner, had been captured off the West African coast by the British cruiser Highflyer. August 28 a British squadron from the North Sea entered the Bight of Heligoland and after a fight of several hours sunk two German cruisers and two destroyers, leaving a third cruiser burning. No British ship was lost, and their loss was small. The same day the British destroyer Welland sunk the German destroyer S-90 off the Chinese coast. August 20 an expeditionary force from New Zealand seized Apia, German Samoa. Ambassador Chinda issued a statement August 28 saying Japan would not take part in the war in Europe. A Japanese expeditionary force has occupied the island of Tsi-chien, in Kiao-chow Bay, facing the German forts of Tsing-tao, according to a Shanghai dispatch. A Japanese destroyer, which had gone aground on the Lien-tau island, was destroyed by the German gunboat Jaguar. Reports from Vienna September 2 stated that along the Russian-Prussian-Austrian border 3,000,000 men are engaged and that the battle line extends for 400 miles. Lemberg was captured by the Russians September 2, after a seven-days' battle. Appalling slaughter is reported. September 2 it was stated that the Germans were strongly fortifying Brussels, evidently fearing an uprising of the people. They have issued an order that in case of any effort to resist the German authorities they will train their guns upon the city. Antwerp is being prepared for a state of siege and the military governor has ordered all people who have not been domiciled there a month to leave.

THE NEW POPE.—Cardinal Della Chiesa, archbishop of Bologna, was elected Pope September 3. He will assume the name of Benedict XV. Cardinal Farley of New York, was the only American taking part in the conclave. Cardinal Giacomo Della Chiesa was created a cardinal May 21, 1914. He is the son of an Italian marquis. He was born at Pegli in the diocese of Genoa, November 21, 1854, making one of the youngest popes ever elected. He was ordained a priest December 21, 1878. He served as secretary of the Nunciature in Spain from 1883 to 1887, in which year he was appointed secretary to the late Cardinal Rampolla. He was appointed substitute secretary of state in 1901 and in 1907 he was elected to the post of advisor to the Holy Office. It is 174 years since the last Pope Benedict.

CROP REPORTS.

August 17. The drought which has lasted about two months was broken a week ago by some fine showers which have made all crops look better. Hay was put up in good shape. The oat crop is nearly all cut. Potatoes are small, with but a few in a hill, but some later pieces may do better. Cows are shrinking badly. Corn is doing well. The buying and selling of cattle seems to be at a standstill. Butter is 28; eggs 21. P. S. S.
Mayville, N. Y.

August 17. The main money crop in this part of Michigan is milk, with Detroit for a market. The price runs from 12 cents to 22 cents per gallon, according to test. Good cows are selling at $75 to $110; poor or common cows go to the butcher, milkmen won't have them. Beef cattle from five to nine cents per pound; hogs $9.35 per hundred live; no sheep in this neighborhood. Corn 90; oats 45; wheat 92; beans $3. J. L. H.
Birmingham, Mich.

August 29. Apples here are but part of crop, and the State over about the same as last year, a half crop. Northwestern Ohio has a good crop of peaches, although there are many small ones on the market. Northeastern Ohio, east of Cleveland, has practically no peaches. Ottawa County growers are anticipating one of the largest peach yields in the history of the county. Lucas County will have a good crop. Grapes, pears and plums good. Corn is good, oats are fully an average crop. We had dry spells, one in June and again the last of July and the first of August, and this dry weather occasioned the small peaches which now are on the market. W. J.
Waterville, O.

August 21. Hay all in; grain just coming, along, good crop. Gardens looking well, and now plenty of rain, though from the middle of July until the middle of August it was quite dry. Potatoes good, new ones selling at $1 per bushel. Peas about 30 cents a peck. Grain corn $2 per cwt.; oat 60; feeds $1.65-$175. Milk seven cents a quart; butter 34 and eggs 28 to 39. The army worm is reported at a few farms around, but in all so far the crops have not been injured by any of common kinds, though the tent caterpillar and Brown-tail moths are quite prevalent. J. C. H.
South Thomaston, Me.

COMING FARMERS' MEETINGS.

National Apple Day, October 20.

National Dairy Show, Chicago, Ill., October 22-31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Association, Oct. 27. Official Dairy Instructors' Association, Oct. 27. National Dairy Union, Oct. 28. American Dairy Farmers' Association, Oct. 28. Council of the National Dairy Show, Oct. 28. National Association of Creamery Managers and Owners, Oct. 28. American Jersey Cattle Club, Oct. 28. National Association of Ice Cream Manufacturers, Oct. 28, 29 and 30. International Association of Dairy and Milk Inspectors, Oct. 29. American Guernsey Cattle Club, Oct. 29. Congress of Marketing, Oct. 29. Milk Producers' Association, Oct. 30.

New England Fruit Show in connection with the Rhode Island Fruit Growers' Association annual meeting, in Providence, R. I., November 9, 10, 11 and 12; secretary, A. M. Parmelee, Norwood, R. I.

National Grange, annual meeting, Wilmington, Del., November 11-14.

Maryland Week Exhibition, State Horticultural Society, Maryland Crop Improvement, Dairymen's and Beekeepers' Association, Baltimore, November 16-21.

Annual Show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

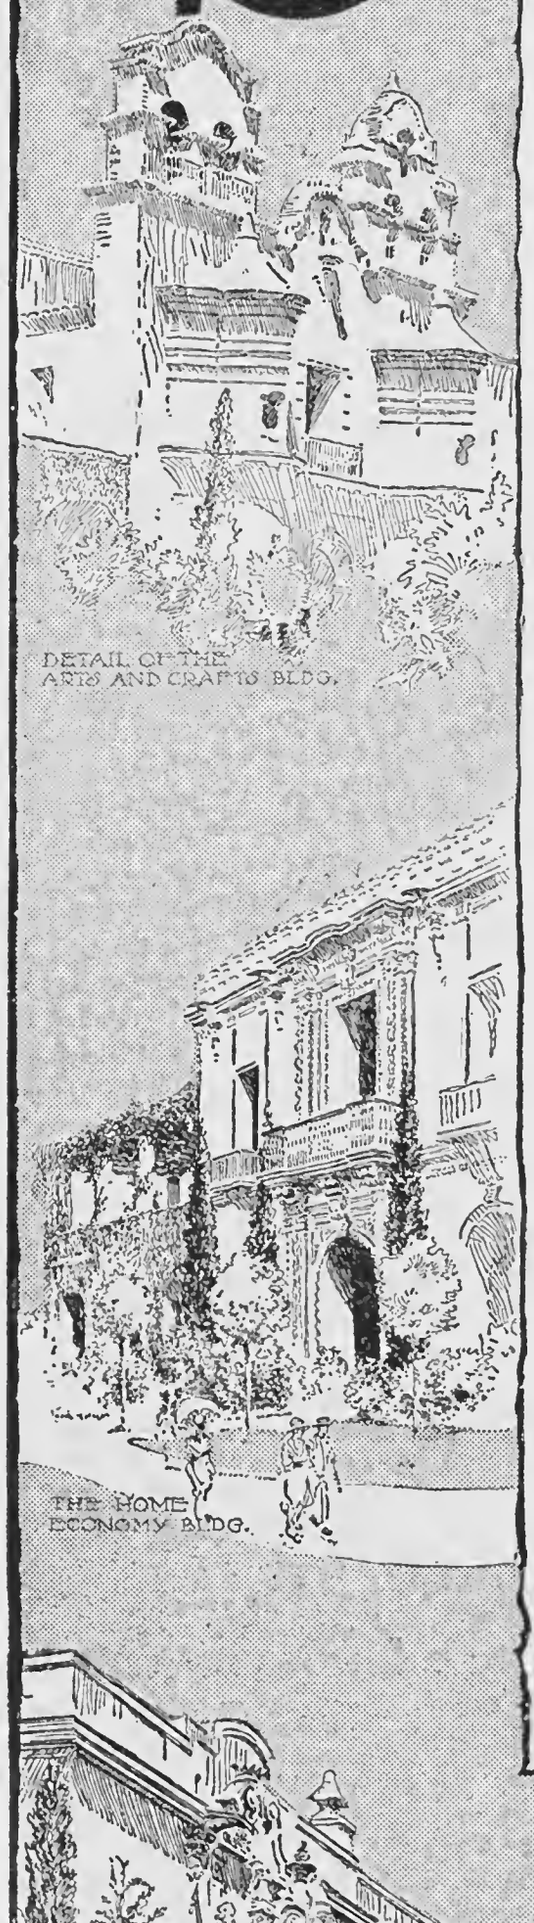
Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

Western Connecticut Poultry Association of Danbury, Conn., Inc., nineteenth annual exhibition, Hull's Armory Hall, Danbury, Nov. 26, 27, 28; secretary, Thomas Deans, 39 Hoyt St., Danbury, Conn.

New York State Potato Association will hold two field meetings, one at Victor, N. Y., September 12. Potato fields will be visited in the forenoon. Basket dinner at 12, at Nathan Baker's farm. Prof. M. F. Barrus will speak on "Potato Diseases." Geneva Experiment Station representative will speak on "Increasing Profits by Seed Selection." Discussions by Daniel Dean, president of the association, and others. M. F. Webster, Victor, N. Y., is in charge of local arrangements. The other meeting will be at Malone, N. Y., on Saturday, September 19, in the fields of H. W. Spencer. Prof. Barrus will speak on "Potato Diseases," and Prof. C. H. Myers of Cornell, and Daniel Dean of Nichols, will speak on "The Profits of Seed Selection," and Prof. E. V. Hardenburg, of Cornell and Mr. W. M. Peacock of Cornell, will speak on "The Profits of Seed Selection." Mr. O. F. Ross, Franklin County Farm Bureau agent, is in charge of the local arrangements.

HUSBAND: "Come along! Keeping me here standing like a fool!" Wife: "Do be reasonable, dear. Can I really help the way you stand?"—London Mail.

San Diego Panama California Exposition



California's Great Exposition, Celebrating the Opening of the Panama Canal

What ails your farm?

IT is no uncommon event for a city man to discover that downtown property which his father bought for $100 is now worth $100,000. That is largely luck. But do you often hear of farm land selling at $1.88 an acre and sixty years later selling at $57—on an average, with big tracts selling above $1,000 an acre simply on merit as farming property?

The United States census shows that is what California land has done. It has not been luck, but energy. Man has found a waste place. He diverted water to it, expended a little labor, and desert has been changed to garden of the most amazing fertility.

That land is in the great Southwest—8,000,000 acres now under cultivation. There is land exactly like it waiting for the same sort of treatment—44,000,000 acres of land waiting for water and labor. The water is accessible. Who will supply the labor—and reap the benefit?

San Diego, California, the first port of call north of the Panama Canal, will celebrate the opening of the canal on January 1, 1915, by opening the Exposition Beautiful. San Diego's Panama Canal Exposition. Its makers have dared to do new things. In the whole exhibit space, the largest space any exposition ever contained, there is not one exhibit that is lifeless. Everything moves.

You wish to know the methods of large scale farming? Look at them. You will not see standing, idle machinery. You will see machinery in operation on a big tract sown to different crops.

You wish to see intensive farming? Look at it. You will not see charts. You will see a model 5-acre farm with its neat rows of fruit trees and the ground between covered and growing vegetable plants, the vineyard beyond, the poultry yard in the rear—the whole producing on an extraordinary scale, a scale which allows a single family to profit by single acre farming. You have a little tract at home that you don't know what to do with. See this model intensive farm and you'll find out.

You wish to see how oranges are grown. Look. You don't see a crate or two of fruit. You see orange and lemon and grape-fruit growing in the model citrus orchard—producing fruit within reach of your hand. Down the Alameda you see little brown men from Ceylon cultivating the tea plantation whose tea saplings were transplanted here from Colombo. You see the young plants started, you see the leaves being stripped and cured, you see the tea brewed and served to you by Singalese girls.

Solve the question at San Diego

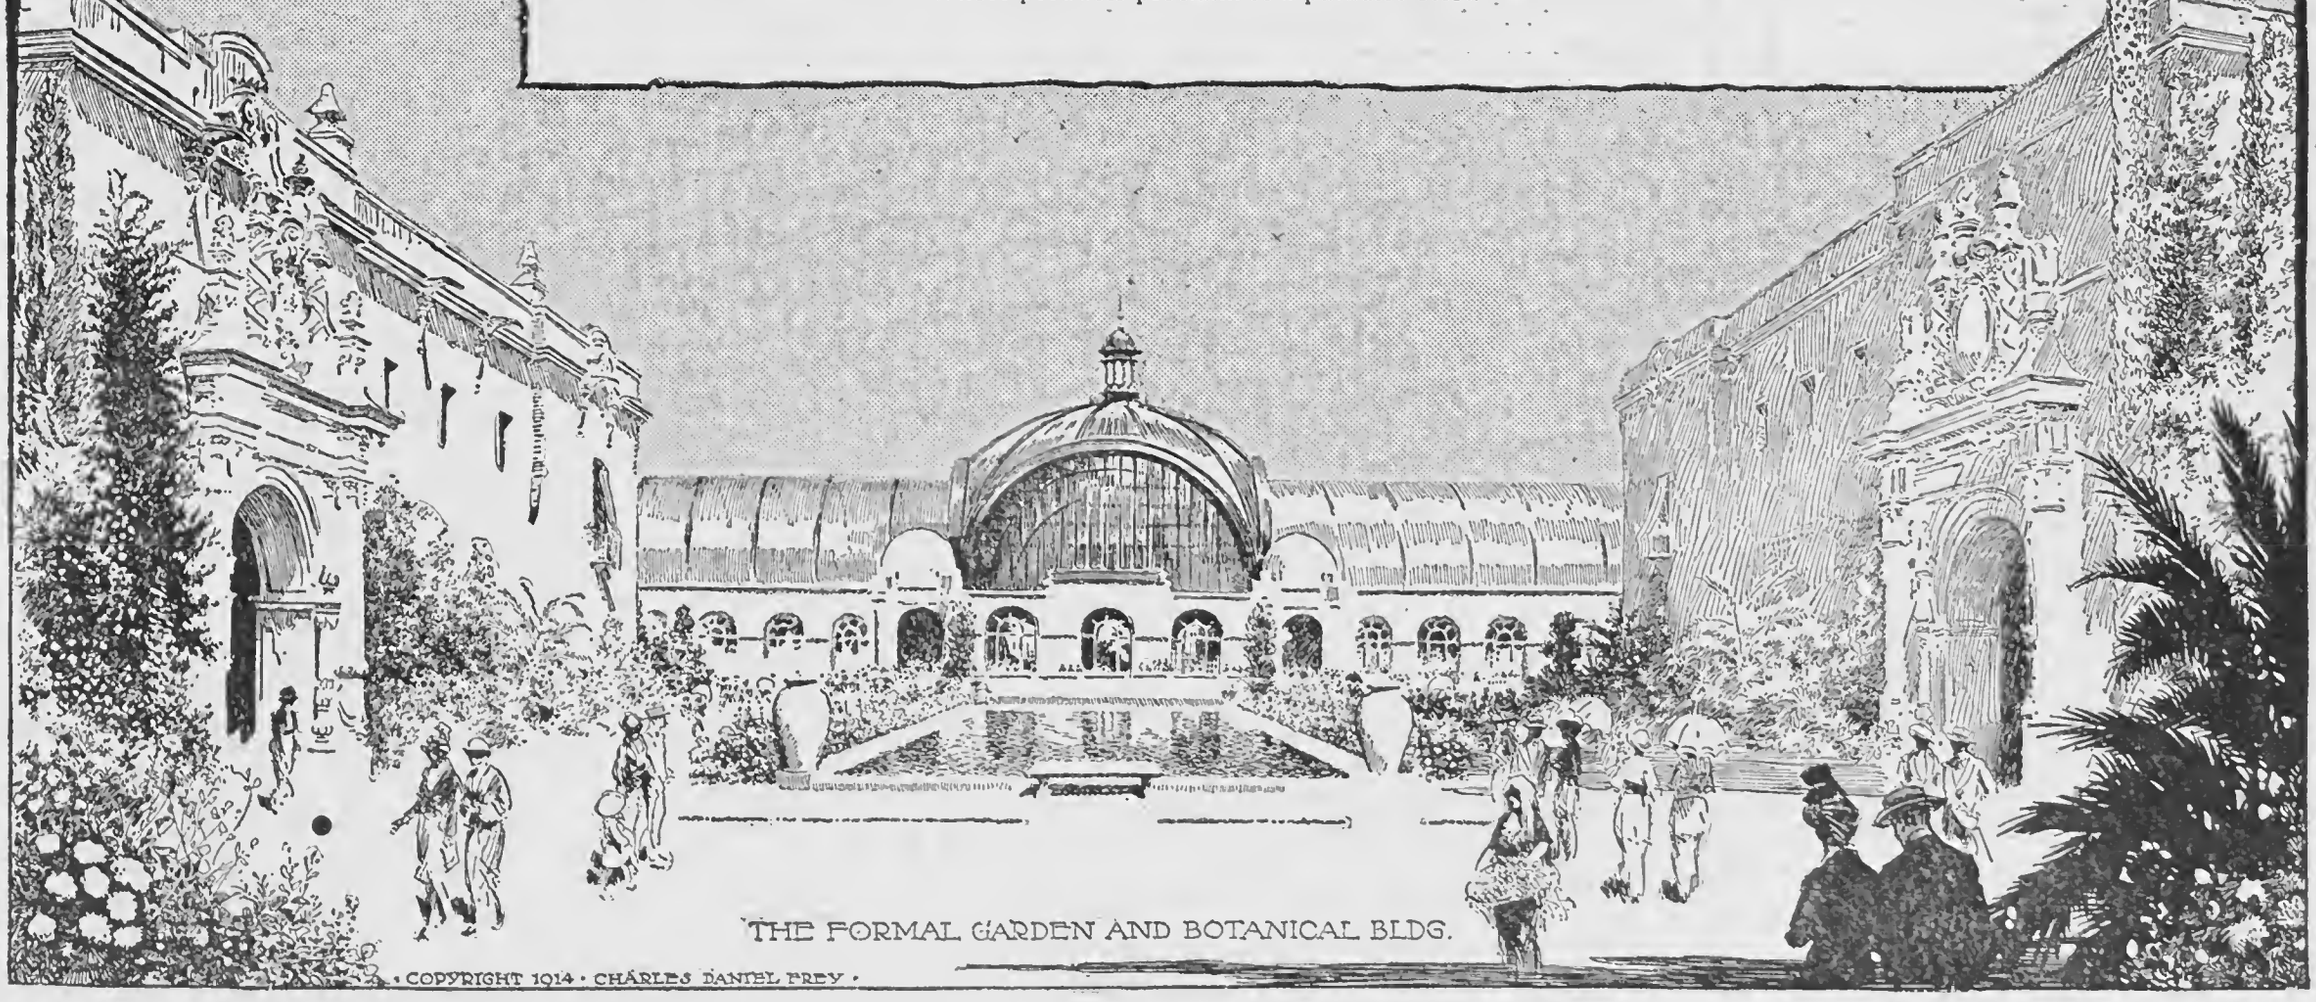
What ails your farm? Well, if anything ails it, you are the one to decide. Find out what's the matter. Visit the Exposition Beautiful at the furthest south of Uncle Sam's Pacific ports, then figure out how the lesson may be applied to your own life work. See why it is that the model farm is able to make a big profit, why the women and children as well as the men find the farm life pleasant and profitable. This is opportunity.

Pick the time of year you please. San Diego's Exposition Beautiful opens on January 1st and closes on December 31st. No other Exposition could do it, for here there is never frost nor stifling heat, nor protracted rainy season. It has won its title, the Exposition Beautiful.

But more important than beauty, more important than the quaint charm of Spanish architecture and Spanish costumes of the men and women who will people the grounds, is the mighty message of the new type of agriculture, a message that is not confined to the southwest.

1915 **Get your ticket to San Diego All the year** **1915**

Solo los productos del terrenal Paraiso no tendran
que envidiar los de esta nueva Sevilla de Occidente.
"A new Seville in the land of the west
Whose products proclaim it a paradise blest."



• COPYRIGHT 1914 • CHARLES DANIEL FREY •

FARM MANAGEMENT.

ORGANIZATION is the foundation of all business methods. To succeed in the management of a farm, one must be able to organize, reorganize, organize again, and then organize in detail. A young man starts out to manage a general farm for himself, a period of years. He begins by looking into the future and making organized plans of crop rotation and crop adaptability to those particular soil conditions which he has to deal with. As the time of putting the crops in approaches he will find places where his first plans are weak and will reorganize them. Weather conditions may cause him to organize again. As he actually sows and plants he will need to organize in detail. This process of organization will induce strength of character and of purpose, and will insure better crop returns.

Given a hundred-acre farm with some fruit, stock it according to your pocketbook, and the tillable land. Hire the best man you can get at a reasonable wage. Go slow in the purchase of new tools. Buy only those that you are sure will return a good dividend on the money invested. If old tools are available, repair and use as long as practical. The newness of a tool does not measure its efficiency.

In stocking the farm let quality be the standard rather than quantity. Then breed for better quality and cull the quantity. But even a second grade brood mare, bred right, may help you to solve the power question. Plow deeply and thoroughly and think as you plow. Harrow once more than you think it needs rather than once less. Cultivate thoroughly and keep continually at it. Cultivation is cheap fertilization. Use all available home fertilizers and go slow in the use of commercial fertilizers. Money is easily thrown away at this point.

If land needs under-drainage and capital is lacking plow in lands to aid surface drainage until drains can be put in. Aim to put in some under-drains each year.

If a silo is not at hand, plan for one at once. If a man is justified in going in debt for any improvement, the silo is that improvement. Now plan for a good corn crop to put in the silo, but do not put all of the barnyard manure on the corn crop. Put part on a meadow that needs coaxing, and make up to the corn by better tillage.

A four or five-year rotation works satisfactorily; corn, oats, rye or wheat, and hay one or two years. This may be varied by putting part of the corn stubble into potatoes and cabbage, seeding with peas and oats after this, bringing the rotation out the same. (The cabbage is worth all it costs to raise to feed to the dairy.) Remember good seed plays an important part in the production of a good crop. Buy the best seed and raise better. Save your own seed wherever practical. Give the fruit the best care you can without neglect to the general farm crops. Spraying pays, but can be overdone on a general farm.

Be cautious of hiring extra help unless you see cash returns to warrant it. Plan for cash returns from dairy, live stock, fruit, potatoes, cabbage, and wheat. If farm is yours spend surplus on permanent improvements to the home, buildings, stock, and land.

Think and plan while you work, and yet find time to lift up your head and enjoy the fruits of your labor. Manage to see and know what the other fellow is doing, but, if he is watching you on a new venture and laughs, wait; if it fails laugh with him and try again; if it succeeds laugh last, but do not brag. Accept all fair-minded criticism with a spirit of good fellowship and remember "Eternal vigilance is the price of liberty." UNCLE ERNEST.

Plowing Under Soy Beans.

I WAS greatly interested in your reply to C. L. A. on page 967. Perhaps my experience will be of value. In the Summer of 1913 I drilled in about two acres of Soy beans, securing a fine crop, which I partly harvested with the help of the poultry, allowing the residue to die down, supposing that to be the end of them, but in plowing and harrowing the land this Spring I found the stalks a perfect nuisance, only exceeded in degree by corn or sunflower stalks. Upon proceeding to plant a Summer crop, I discovered the Soy beans, which I had supposed winter-killed, sprouting furiously. Of course all further operations were suspended and the beans allowed full swing, with the result that I have had a most beautiful time keeping my fruit trees clear of the growth. This will all be turned under this Fall, and a cover crop of rye or wheat sown. No more Spring plowing of Soy beans for me. D. H. COBB.
New Jersey.

Fall Plowing Peach Orchard.

I PLANTED 200 peach and apple trees in the Spring on rather poor ground. Last month I sowed buckwheat with the intention of plowing under this Fall. I have been told since by some local authorities that this is not a good plan, as it forces the growth of the trees at a time when the sap is liable to be frozen. Let me have your opinion as to whether I should harvest or plow under. T. B.
Orange Co., N. Y.

It is a mistake, in your latitude, to plow or cultivate peach orchards in the Fall. Such working of the soil stimulates a late growth of wood. This does not mature, and a hard Winter is likely to injure it by freezing. One object of the "cover crop" is to prevent late growth by taking moisture from the trees. Such trees with a crop growing around them are more likely to stop growing and ripen their wood and fruit. In this case we should cut the buckwheat or let it decay on the ground. It would have been better to sow clover with the buckwheat. This would have given a crop to grow on through the Fall after the buckwheat had been cut.

Avoiding Surface Water.

WHAT right has our neighbor below when digging an open ditch along our line fence to make a bank about a foot high so surface water cannot go through as it always has, and in one place where a lot runs in a wet time he has driven posts and made a dam of planks, dirt and stones. If holding the water back drowns our crops out, is he liable for the damages? Also what can he do if we make a bank up and down the hill at right angles to his so when water enough comes it will cut through his dam or bank. His open ditch will carry all water that goes there unless at time of Spring thaws; it never has washed his field or damaged his crops to any extent, and was built on purpose so we could not run a ditch there to dry a wet place above. A. T.
New York.

New York, as well as most of the States, follows the common law principle in this regard that surface waters are a common enemy which every farm owner can get rid of as best he can, provided he does not use it directly for the injury of his neighbor. The owner of the upper land may keep it on his property or let it flow to the lower level, and the lower owner may either receive it upon his land or ward it off by filling in and making his land higher, or by means of embankments or other obstructions. But this right is qualified by the requirements that he shall not converge it into a stream and pour it in a flood upon the land of the adjoining owner. So if the lower owner fills up his land so that the natural flow of the water is reversed and it creates an artificial channel or current upon the adjacent land, it imposes upon it an unnecessary burden and he would be liable for damages.

HOW TO TRAP SQUIRRELS.—Could you tell me the best way to get rid of the red squirrels? They are in the house, and as the house has tile on the roof, there is no way to keep them from going up under them, and they are taking all the apples off the trees, chewing up the pine cones and so on. I can not use poison. If I should use a trap, what would be the best bait to use? W. H. E. S.
Massachusetts.

"Now tell us," sternly demanded the young legal luminary whose brow overhung like the back of a snapping-turtle, addressing the cowering witness, "what was the weather, if any, upon the afternoon in question?"—Puck.

A SCHOOL TEACHER in one of the counties of New York State recently received the following note from the mother of one of her pupils: "Dear Mis, you writ me about whipping Sammy. I hereby give you permission to beet him up eny time it is necessary to learn him lessons. He is juste like his father—you have to learn him with a clubb. Pound nolege into him. I wante him to git it and don't pay no atenshion to what his father says, I'll handle him."—Everybody's.

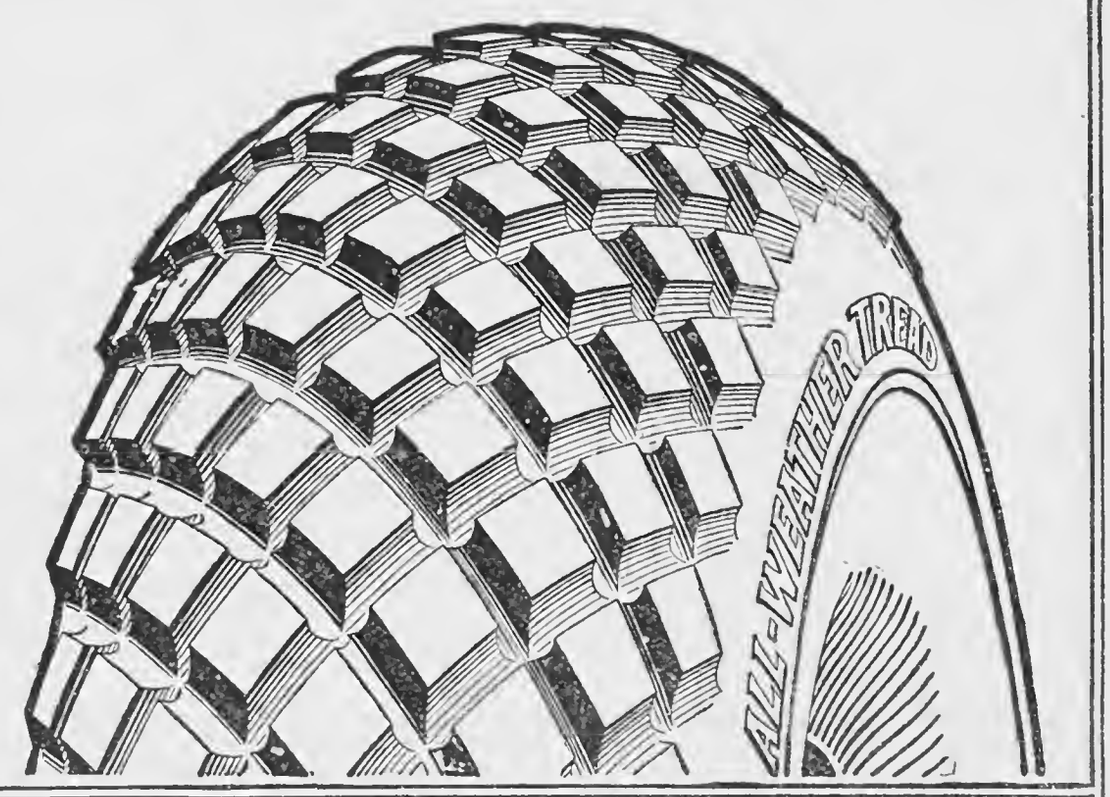
Your Enemies

as a Tire User are

Rim-Cuts
Blow-Outs
Loose Treads
Punctures
Skidding

Note How we Combat them in

No-Rim-Cut Tires



Needless Tire Troubles

Rim-Cuts — the chiefest tire troubles — are utterly needless. They are ended completely — in a faultless way—in Goodyear No-Rim-Cut tires.

Blow-Outs, in large part, are due to wrinkled fabric. Our "On-Air" cure eliminates this cause. This exclusive Goodyear process costs us $1,500 daily.

Loose treads we combat by a patent method. Hundreds of large rubber rivets are formed in each tire, reducing this risk 60 per cent.

Punctures are minimized in our All-Weather tread. It is tough and double-thick.

Skidding is best combated by this same exclusive tread. The grips are sharp, deep, resistless. Yet the tread is flat and regular. It runs as smoothly as a plain tread.

Save These Losses

Save the avoidable troubles. Get all the safety, strength and mileage that you can. Then you have the utmost in a tire.

That is what Goodyear gives you. In the five ways cited, no other maker offers what we give.

The result is that Goodyear leads. No other tire commands such prestige or such sale.

And our matchless output enables prices which few makers meet.

GOODYEAR
AKRON, OHIO
No-Rim-Cut Tires
With All-Weather Treads or Smooth

Tires are not alike. Only one tire made offers these great Goodyear features. Get it. Learn what it means to you.

Construction of Cesspool.

HOW far must a cesspool be from the house in order to comply with the State's demand? Should it be constructed of concrete? G. P. D.
Honesdale, Pa.

Any regulations with regard to the position of a cesspool are likely to be those of your local health authorities, and may be ascertained by application to your board of health. In the absence of such regulations, you should construct a cesspool as far as possible from any well or spring supplying water for household purposes. The exact distance necessary for safety varies with the character of the soil; from 100 to 200 feet is not too far. A cesspool is not constructed of concrete, as its purpose is to permit of gradual soaking away of the contents into the soil through the interstices in its wall and from the bottom. It should be laid up with stone without mortar and covered with earth. Where a common cesspool is not desirable, or permitted, a septic tank of concrete may be constructed. This is a more expensive method of disposing of house wastes, but safer, and to be preferred. M. B. D.

A Thrashing Flail and Sweet Clover.

LAST year on the subject of thrashing beans, the flail was referred to, and that implement accused of breaking the beans. If so, it is the fault of the man doing the work, hitting the bare floor. Always strike a deep layer of straw. If more convenient, a canvas may be spread in the open field in a very dry time, and a small amount of beans, peas, rye, Sweet clover, or almost any grass or cereal may be thrashed in the field and winnowed in the breeze by holding the scoop high over a metal tub or basket and pouring the seed two or three times. A screen of proper size will take out the large stuff still contained and a second one the small stuff. In this way I have repeatedly prepared premium-getting rye and beans for the fair in a few minutes, and freshly thrashed cereals will look bright and fresh. I consider the flail a necessity on every place for saving small bits of grains and grasses for seed.

As good a flail as I have ever seen, with a swivel head, is easily made if you have or can obtain good tools to work with. I made my own as cheaply as I could borrow one, as I have all needed tools but a wood-working lathe. It needs but a few. A four-foot stick for the handle the size of a hoe handle may be made or appropriated. Into the outer end bore a hole with a sharp half-inch bit about five inches deep. Turn or whittle a pin to fit a hole made by the same bit, and leave a head one inch in diameter for the outer end. Make a bar of heavy wood 20 inches long by two or 2½ inches in diameter, with a hole at one end to connect with the handle. A piece of strong leather two inches by five with corners slightly rounded and a half inch hole near each end is so bent that the pin shall pierce both holes, with the grain or hair side of the leather both facing the same way, making the swivel. The pin is then inserted into the hole in the handle till it presses the leather against the handle. With a bradawl, make a hole through both pin and handle, near the end of the pin opposite to the head and insert a wood screw to hold it in place. With a leather thong tie the swingle to the leather swivel. If you have tools and materials handy, all but the pin can be made and put together in a few minutes. I have a wad cutter for a shotgun, with which I made the holes in the swivel leather, but a penknife would also easily make them.

Perhaps you wonder why I referred to thrashing Sweet clover. So many have spoken of the value of Sweet clover as forerunner of Alfalfa, and to fertilize the soil itself, that two years ago I sowed an acre, and this year planted corn on the ground, and on adjoining ground that did not have Sweet clover. The result on the growing corn crop convinced me of the value of Sweet clover, neither did my cattle have to be starved to force them to eat the young Sweet clover with avidity last year. E. W. A.
Michigan.

"I PUT my reliance in the wisdom of the plain people," said Senator Sorghum. "But suppose the plain people do not happen to agree with you?" "Then I refuse to be influenced by the clamor of the thoughtless crowd."—Washington Star.

GRAB THESE BARGAINS-QUICK!

THEY WON'T LAST A WEEK!

21 of the greatest bargains ever offered. At prices lower than we ever saw before. Order today or you may be too late. Every article guaranteed. Inspect goods at depot and return at our expense if not as represented. These special lots of quality goods are too small in quantity to go in our big catalog. You take no risk in buying direct from this advertisement, as we agree to return your money and pay all charges if you do not want the goods after you see them. Send money order or check, and rush your order, or you will be too late to get in on this great bargain sale. Prices at least 50% lower than you can get the same goods elsewhere. Mail your order today.

Hope Farm Notes

COVER CROPS.—I have talked cover crops so much that there may be little more to say. This year, however, in the Eastern States at least, the cover crop question is more important than ever before. This crop growing through the Fall will not only prevent the loss of nitrates from the soil and add organic matter, but it will help us with the potash problem. These Fall-growing crops and particularly such as rape and turnips, have the power to take up large quantities of potash. Not only this, but their action upon the soil in decaying after they are plowed under helps to set free more plant food. Next year, when practically all fertilizers will be low in potash, we shall be obliged to look to the soil for our supply, and these cover crops will help us find it. Thus more than ever before it will pay to keep the cultivated fields covered with some growing crop this Fall. It is now too late to sow Crimson clover or vetch in our latitude. Rye is our old standby, with equal parts of Cow-horn turnips and rape seed along with it. This combination has gone into our corn. Ragweed is another "crop" which helps the potash supply. From the analysis of its ashes I believe this to be a very useful potash plant. It grows abundantly with us whenever cultivation stops, and we cut it and pile around the trees.

LIVING COVER CROPS.—Questions about sowing oats among the strawberries at this season—to serve as a Winter mulch—are beginning to come. I have often explained about this, but people do not remember or have not read it. Barley is a better grain than oats for the purpose, but a combination (half and half of each) will make a closer mat than either alone. The plan is to sow the grain about the middle of September when the ground is moist and after the crop has been well cleaned out. A thick seeding is made. On rich ground and in a wet Fall the grain makes a heavy, short growth among and around the plants. Frost usually kills the grain crop by December, and it mats down over the berry plants giving a partial protection and holding the snow. We never knew the grain to give enough protection to take the place of a good coat of manure or straw. In our own case we think it a mistake to interfere with the growth of the plants during the Fall. They are then forming their fruit buds for next season, and need good culture and the entire ground. In a peach or apple orchard the object is to stop cultivation and start a crop which will prevent growth on the trees. I want just the reverse of this on the berry plants, and instead of seeding something to hold them back I would crowd them along.

APPLE PROSPECTS.—We have a good crop of fine fruit this year, and the problem of disposing of it to advantage becomes a hard one. The early apples have been very low thus far. No one has made any money shipping culls or windfalls—in fact I think the time spent in picking such stuff has been wasted. There is no doubt as to the size of the country's apple crop this year. The European War will shut off a large foreign demand. There seems no way of getting the fruit into Germany, and the English people can hardly be expected to buy apples while the nation is under such a fearful expense for conducting the war. Some shipments have already been made, but the future trade will depend on what these earlier shipments bring. The Pacific coast fruit has been shipped freely to Europe the past few years, but the export trade will be small this season, and if this trade comes east at all it will go into competition with our local fruit. If the Western growers can receive the cost of package, packing and shipping and part of the cost of growing they will do well this year.

WHAT TO DO.—In the face of all these facts the Eastern apple grower must do some high living and quick thinking. Any man who will deliberately try to put poor fruit or careless packing on such a market as we have this year is worse than a dunce. Far better give such fruit away as an advertisement—not of what you have to sell, but of what an apple tastes like. Personally I expect to put my apples down to a fair price and work them off promptly in our retail market. What is a fair price? The cost of production and the packing and 15 to 20 per cent. above to cover shrinkage and losses. When I can get that I let my stuff go. I should regard the plan of holding fruit for a rise this year as a good gamble and no more. I am not trying to depress prices, but simply giving what I think to be the facts. I think this is one of the years when we can well afford to sell our apples close to cost in order to advertise them. The orchard business is one for a long series of years. We are sure to have, now and then, a season like this one, when, through a combination of circumstances, there is a heavy production and a curtailed market. That comes as a hard lesson for us to standardize and do better packing and use our surplus for advertising purposes. Sell the high-class fruit at the best figure we can obtain and

A HOPE FARM PLANT GROWER.

let the culls go for what they will bring to people who do not usually eat apples. This will make new customers, and another year they will all come back for more.

FARM NOTES.—I call it rather strange—this prejudice in favor of a yellow peach. The white peaches, like Carman or Belle of Georgia, are very much finer than Elberta, yet most people will hardly look at a white peach when "Ben Davis with a pit" comes along. That seems to me a good name for the Elberta peach, Yet most people still eat with their eyes and the yellow flesh is what gets them. Our Carmans gave a good crop this year. The older trees produced more small fruit than we like, but we still regard Carman as the best of its season for a local market. Many people sniff at the idea of using Carman for canning, but for those who are not color crazy the thick creamy preserve which Carman makes is about the top-notch. The best canning peach I know of, all things considered, is Crosby. A rather small peach, firm and solid, it comes out of the can in great gold nuggets of the highest quality. There can be no doubt that the war has hurt the market for peaches. Prices have ranged very low, but our own crop has sold freely at a profit to us..... Several people ask why we put manure or grass and weeds around the apple trees at this season. We usually plan to clean up the manure piles and cut the weeds and trash in late August. All this is carted out and spread around the older apple trees. Just at this season such trees are maturing fruit buds or finishing a crop of fruit. That is when they need most encouragement and help. I would not manure young trees at this time if they had made a proper wood growth, but the older trees need reinforcements right now. If a woman had prevailed upon her husband to beat the carpet, when would she go out with the cup of coffee and the plate of doughnuts? Right at the beginning of the end of the job when the man was prepared to quit and say "That's good enough!" when he knew there was dust still left in the carpet.....Those late planted potatoes are still green and growing. It looks as if we should get a fair crop after all—but I make no guess until the vines are dead. If we can work this scheme in our latitude it will prove a great help. Our regular potato crop is good—the best we ever had. You remember that we plowed under a big crop of green rye, packed it firmly, then opened furrows with a shovel plow, dropped the seed pieces right into the green mass and covered with a cultivator. We have had sufficient moisture to decay this rye and keep the soil fairly wet, and this has proved ideal handling for the potatoes. They were planted in a young apple orchard. As the potato vines die there comes in a great mat of ragweed and smartweed. This will be cut and piled around the trees and the potato ground harrowed and seeded to rye for another crop. H. W. C.

The Soil Under Trees.

WILL you give your opinion as to what caused my potatoes and corn to grow much larger in the portions of the lots where I cut down, last Winter, a large oak and a large hard maple tree? One of my neighbors claims the leaves have added fiber to the soil, but as our soil is shallow and underlying a heavy handpan, I believe the roots from these trees have broken up the hardpan and allowed the moisture to be stored up, and the crops mentioned have had the benefit. L. H. A.

Half a dozen or more reasons can be given. The leaves, or a good share of them, have for years fallen on the ground around these trees. This has added large quantities of plant food and organic matter to the soil. A good share of this added plant food was taken out of the lower soil, or from parts of the surface soil 100 feet or more away, as the trees, feeding roots run far. It was like bringing plant food and organic matter and spreading it around the tree. For years little of this was taken away, since the shade of these trees prevented crops from making a full growth. Very likely the feed has been used as a pasture in years past. The live stock sought the shade of these trees, and a good share of the manure was deposited there. The roots dug deep into the soil and brought up some plant food from the subsoil, and also made better drainage. Other reasons might be given to explain why this soil contained extra plant food, and was also in fine physical and chemical condition. Anyone who has ever cleared up an old stone wall or fence row, and planted trees or other crops, knows how all these things have combined to make the soil productive.

Rye in Silage.

I HAVE a field of rye which I am cutting now, and intend to shock. Can I mix this load for load with corn in the Fall, and fill silo without danger of spoiling silage? I would rather do this than have it thrashed. J. E. B.

Our own advice would be against cutting the rye in with the corn. Rye straw is very hard and tough. Cut into the silo it would carry quite a little air, and unless wet and packed down hard it would increase the danger of fermentation and rot. This plan of cutting straw in with the corn has been tried a number of times, but we understand the general opinion is against the practice. What we want is actual experience. Can anyone give it?

ALADDIN DREDNOT

THE ALADDIN Dredno Barn (covered with special process steel) is practically proof against lightning, fire and wind—the worst enemies of the farmer's barn.

Government statistics for fifty-two years show that *no building covered with steel and struck by lightning was ever burned or destroyed by fire.*

The special process Drednot steel used in this construction also resists heat, cold and rust. Drednot barns are stronger and last longer. Timbers are braced and counter-braced with tension rods. The extra heavy timbers in Aladdin Drednot barns make the framework stronger and stouter than that found on the average barn.

A Complete Barn $193

Aladdin Drednot barns are built in all sizes, from $193 up. Price includes all material necessary to erect and complete the barn. Ask about the Drednot barn today.

Aladdin Readi-Cut Houses Save a Third

Aladdin Houses come direct to you—no middlemen—and are backed by our Dollar-a-Knot guarantee. Are cut to fit, saving waste of lumber and labor. 5-Room House, all material, $298. Get Aladdin catalog No. 340.

Ruralisms

Propagating the Grape.

I HAVE a grapevine which bears very fine fruit, but I do not know the name. Would you tell me how to propagate and when to do it? W. W.
Olympia, Ky.

It is very easy to propagate most varieties of grapes, and others are very difficult. The ordinary way is from cuttings. These are made from mature wood of the last year's growth, cut from the vines almost any time when there are no leaves on them or from November to April. The wood should be of strong vigorous growth. The cuttings should be about eight to 10 inches long and with a bud near each end. They are best buried in the ground after being tied in small bundles and left until the time for making early garden, when they should be set in nursery rows in good soil. They can be set by a spade or set in a trench made with a plow and filled in with a hoe, leaving one bud above ground. In any case the ground should be packed very firmly about them, at the bottom especially. Good cultivation should be given. Varieties that will not root from cuttings are layered, that is done by covering a part of a living vine with soil and leaving it so during the growing season.

H. E. VAN DEMAN.

Varieties of Rhubarb.

IS there any difference between the rhubarb roots Myatt's Victoria and Myatt's Linnæus? Is one as good as the other? T. W. B.
Whippany, N. J.

The varieties Victoria and Linnæus are perhaps the most popular sorts and the most largely grown by market gardeners and for private use. The Victoria is very seldom catalogued by seedsmen under the name of Myatt's Victoria, and it is a question in the minds of many whether Myatt had anything to do with its origin. The Linnæus is a strong grower, producing long stalks of most excellent quality, early and productive. The Victoria is perhaps a little heavier producer than the Linnæus, is later and not considered of as high quality. Both are fine sorts and one will not go amiss in planting either or both of them. The Victoria is preferred by some, and the Linnæus is preferred by other growers, the friends of both claiming their favorite as being the better.

K.

Drone Trees in Orchards.

ON page 930 drone trees are discussed on your editorial page. Every orchardist has them unless exceptionally fortunate. My own share of them has been more than liberal, and since they are usually of strong and vigorous growth, my plan has been to put new tops on them by selecting buds from trees that were satisfactory producers. The method used has been to prune severely in Spring and force out a liberal growth of shoots on the stem of the tree. These shoots are budded during the ensuing Summer and allowed to start into growth the same season, and continue such growth during the following year. Then the top of the tree is sawed off just above the strongest budshoot, which is usually one of the uppermost. From six to a dozen buds are usually put in, and the new shoots are from three to six feet in length when the top is taken off. After that growth is rapid and bearing soon begins. A number of trees on my place, peach, pear, plum, persimmon and pecan, have been treated in this way, and in every instance subsequent fruitage has met expectation. A season seldom passes that one or more trees are not worked in this way. No longer ago than last April a lusty young persimmon and strong growing eight year old Mobile pecan were worked with dormant buds, not because they were drones, for they were both exceedingly prolific; but their fruitage was inferior. The stems of these trees are now bristling with budshoots two to four feet in length, while about one-fourth of the original top is still growing and fruiting above. When the remainder of these tops is taken off next Spring those bud-shoots will grow surprisingly fast and new fruits will be expected a season later. Then if the new persimmons and new pecans are not approximately equal in quality to those produced by the mother trees from which the buds were taken, it will be the first failure in a long experience.

To dig up or cut out a healthy, strong-growing drone tree is a waste. Why, indeed, may they not be budded as readily and with as good results as an ordinary, small seedling? The "scientists" who deny this have gone foul on their science. On the drone tree proposition, I am prepared to show the goods in quantity sufficient to convince the most obtuse or incredulous Missourian.

Texas. CHARLES. L. EDWARDS.

Tomatoes Dropping Fruit.

CAN you tell me the cause of young tomatoes falling off, at the point next to the fruit? The plants seem to be healthy, also plenty of blossoms. The plants are Ponderosa. O. B. A.
Southbridge, Mass.

This trouble is most usually caused by failure of the blooms to pollenize properly, which condition may be due to damp cloudy weather or too rank growth of the plants, or both. If either or both of these conditions are responsible, the plants will set fruit freely as soon as the adverse conditions have passed. Tomatoes should not be manured very heavily, one or two small shovelfuls of well-rotted stable manure to the hill is sufficient, even on the poorest soils. Any manures with a high percentage of nitrogen should not be applied in quantity to tomatoes, as the over stimulation will force an abnormal vine growth, which at the beginning of the season is likely to prevent the setting of fruits altogether, or cause many small fruits to drop, by reason of being insufficiently pollenized. This is almost sure to be the case in a wet season. The Ponderosa seems to suffer more in this way than any of the other standard varieties.

K.

Trapping Moles.

I WONDER if any of the Rural family can teach me how to catch moles? I have a good trap and follow instructions as closely as I can, but don't get the moles. Sometimes they burrow around the trap, or the trap is sprung and the animal not caught, but most of the time they seem to avoid the run altogether. How can I tell on which particular run to set the trap, and how set it to insure success? Beetles and drought have done us great damage and now to have the ground honeycombed with mole runs, is a last straw. L. W. R.
Michigan.

There are several makes of mole-traps in the market, constructed on the same general principle, all of which are very successful when properly handled. I have used the one make of trap for years and during that time have caught large numbers of moles, catching as many as seven in the same spot. The mole usually makes his headquarters along the fence or some other part of the grounds that is not disturbed by cultivation, and the best place to set the trap is at the point of entrance to the cultivated ground. The mole feeds twice daily, morning and evening, and seldom passes through the runs during the day, except in damp cloudy weather, when they sometimes work during the day. When the spot at which the trap is to be set is selected, take the hand and fill in the run with soil, pressing it down gently, making the soil in the run level with the surrounding surface. Place the trap in position over the filled-in run as fairly as possible, and push the standards into the ground until the treadle comes within about one-fourth inch of the ground. Now hold the trap in position with one hand and with the other catch hold of the part that contains the pins, pull it up and release it allowing the pins to jab into the ground with the full force of the spring. Repeat this operation three or four times. This will make an easy passage way for the pins, and go far toward success in the trapping of the moles. I find it a good idea to slip a thin piece of wood or stone under the treadle, this should be no larger than the treadle. By doing this the mole will spring the trap more readily and in fully 75 per cent. of springing the trap, catches the mole. Place half a brick on top of the trap; this additional force will drive the sharp pins through the mole, and in some instances prevent it from getting away after being caught, particularly when the pin has only pierced the skin of the body or foot.

K.

"WIL-YUM, what can you tell us about Columbus?" "It's next to last in the American Association."—Buffalo Express.

DON'T PAY WARTIME PRICES

Notwithstanding the European War the American People Need Not Pay Advances for General Merchandise

In spite of the great European war which has been used as an excuse by some catalog houses, manufacturers, jobbers and retail dealers for advancing prices here in America, we will not raise our prices on a single one of the more than 125,000 articles listed in our great catalog so long as our present enormous stocks last and our big contracts for merchandise of every description remain in effect.

No matter what other firms may do, no matter how much they increase their prices, remember you do not have to pay these increases if you will send your orders to The Charles William Stores, New York.

At the time this advertisement is written, that part of the business community engaged in the manufacture and sale of merchandise in America seems to have a bad case of rattles. Notwithstanding the fact that we are not in any way involved in the terrible struggle now going on between the great nations of Europe, notwithstanding the fact that America will have the most tremendous crops in all history, notwithstanding the fact that our mines are yielding their usual quota to be added to the world's wealth, notwithstanding the fact that we are at peace with all the world and conditions throughout the United States are fundamentally sound, manufacturers and producers, jobbers and retail dealers seem to have become fearful that somewhere now unknown to them, our supply of raw materials will be diminished, our supply of food stuffs will be inadequate and there will be a greater demand than we will be able to supply. Already there have been enormous advances in many lines of merchandise, particularly those lines which are produced in whole or in part by European workmen in European factories, or produced in American factories by American workmen with materials in whole or in part imported from the other side.

Dye stuffs, which are produced principally in Germany, have already been advanced in price 1,000 per cent. Just think of it! Dyes which could be purchased a few days ago at a fair price, are now sold at ten times the price they brought on the first day of August! Dye stuffs are used in the manufacture of all American fabrics, whether cotton or wool. Therefore, notwithstanding the fact that American manufacturers have not been compelled to lay in any additional stocks of dyes because most of them are fully supplied for months to come, cotton fabrics and woolen fabrics *have already been advanced in price from ½ cent to 12 cents and 15 cents a yard.* Our prices have not been and will not be advanced a single penny during the life of our present Fall and Winter catalog which is just now coming from the printers ready for free distribution. We have thousands upon thousands of yards of the finest cotton, woolen and silk fabrics in stock ready to take care of the needs of our customers. Therefore you need not be at all alarmed over this situation. We are ready to take care of you at prices even lower than the prices which we quoted in our Spring and Summer Catalog, so long as our big supply holds out. If you pay a penny more than our prices, therefore, you are simply throwing money away.

Swiss watches, jewelry novelties, most of the settings used in rings, lockets, lavallieres, bracelets, etc., come from Europe, but long before the war broke out our stocks were completed. But notwithstanding our enormous stocks on hand and our big contracts for all these goods, our buyers went into the New York market the moment the war cloud came upon the horizon, with instructions to sweep the market clean of anything needed to protect our customers, and we believe we can take care of every order you send us. We certainly will do so as long as we have the goods on hand.

While the linen weavers of Ireland and Scotland are still manufacturing these fabrics and it is possible to import them from Ireland and Scotland, unfortunately most of the flax used by our Irish and Scotch friends is purchased by them in Russia. If the war lasts any length of time it may become impossible for them to get their new supply of raw materials and under such conditions a scarcity of linens will force the prices up, but that will come, if it comes at all, in the Spring of 1915. Taking advantage of this situation many importers, jobbers and retail dealers are already advancing their prices, tho' they have not had to pay a penny more for the goods they have on hand at present. We have enormous stocks of linens, we have an enormous supply in reserve and we feel sure we can take care of every demand between now and the first of January at least. Not a penny of advance do we ask for any of these goods we now own and offer at our present catalog price.

Most of the tin used in America comes from Wales. There are large stocks in America and the miners are still at work in the Welsh mines. Boats are still plying their trade between England and America, but notwithstanding this fact, manufacturers, producers, jobbers and retailers are taking advantage of this situation to increase the price of everything in which tin is a component part. Block tin, tinware, enamelware, galvanized iron of every description, all are being affected by this arbitrary increase in price, which we feel is unwarranted. Our prices remain the same and our contracts, we believe, protect us for months to come. As long as we have the goods and our contracts are in force you can have what you want without a penny advance in price.

As you know, most of the finer laces and embroideries used in the manufacture of dainty gowns and lingerie are imported from Switzerland and France. Dresses made of lace and net and embroideries have therefore suddenly gone upward. Manufacturers have become panic stricken for fear that they will not be able to renew their present stocks when they are exhausted. Our stocks of dresses and lingerie made up of laces and net and embroidery are enormous. We have big contracts placed with responsible manufacturers for other tremendous supplies. Our shelves bulge with the new goods for Fall and Winter which were brought into our enormous stores before the war clouds broke. Our prices were fixed before the war commenced. Our merchandise was purchased long in advance and so long as our present great stocks last, and we think they are adequate to take care of the orders we receive until the first of January, we will continue to sell at the old prices.

Gloves, novelties, notions, low priced shot guns any many other lines which are produced in France and Germany, Belgium and Holland have also been arbitrarily advanced in price by importers and jobbers and retail dealers, but our prices remain on the same low level because we have enormous stocks, we have iron clad contracts with responsible people and we are prepared as never before to take care of all of the business which will come our way.

This situation ought to be a revelation to the American people as to the tremendous savings they can make by patronizing The Charles William Stores, the organization with foresight, with enormous financial resources, with tremendous warehouses where almost unlimited stocks are put away and held in reserve for just such emergencies as this.

Of course the little retail dealer with his few thousand dollars worth of merchandise is absolutely at the mercy of manufacturers, producers and jobbers when collectively they decide arbitrarily to raise prices. What can the little distributor of merchandise do under such conditions but pay the price demanded by those who supply his stocks of merchandise? This action is not confined to the little fellows, by any means. Even big dealers, with generous stocks of merchandise, are taking advantage of this present war time scare, we regret to say, to wring extra dollars, added profits, from their customers. We are anxious in this emergency to prove to the American people that ours is a store operated on a high plane of business ethics, that we have swept the world's markets for the best things that money can buy, that we have assembled this merchandise in our great warehouses on a cost basis below that of almost any other merchandise organization in America and we are ready now to pass this merchandise along to you with just one small profit added, which means that the price we name in our catalogs will make 50 cents to 80 cents buy as much high class, dependable merchandise as you can get anywhere else in America for one dollar.

If you have never purchased merchandise from The Charles William Stores, if you have never experienced the satisfaction which comes as a result of purchasing goods from us, sit down now and write us a letter or a postal card and say "send me a copy of your Big Free Catalog," and the day your request is received, we will mail a copy of our great catalog free and postpaid. Then as you study its pages, as you look through it leaf by leaf, you will realize what a tremendous factor we will be in helping you save money if you take advantage of the wonderful prices we quote, the splendid service we give and our offer to deliver your necessities to your nearest railway station or your doorway, all charges prepaid by us.

We regret more than we can say that in this enlightened age, such a conflict as that now raging in Europe should make a message like this address to the American people necessary. We hope that by the time these lines reach you, or very soon thereafter, all the warring nations will lay down their arms and that peace may again prevail. But, in the meantime, please remember that we do not feel there is the slightest reason for levying tribute on the American people for anything they use or wear because misguided nations in Europe are flying at each other's throats.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.01, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

IT is true that every now and then some good farmer comes up with a good argument for cutting Soy beans, cow peas, sunflowers, clover or some other crop into the silo with the corn. We do not question the claims made by such farmers, but we think it safer generally to fill the silo with corn alone, and cure the Soy beans or cow peas into hay. In theory the beans and corn together make a "sandwich" for the cows. Yet the corn silage and the dry legume fodder also make a sandwich, and in some respects a better one than when both parts of it are fermented in the silo. A cow certainly does better with some dry fodder along with the silage. In theory beans and corn put into the silo together may make a balanced ration, but it is too bulky to give results without grain and dry fodder. Our advice is to fill the silo with corn alone, and to cure the other crops to feed as hay.

*

ALL sorts of people are organizing these days. The latest poultry society is composed of the men and women who have entered hens at the Storrs egg-laying contest. The wives or husbands of the hen owners are eligible to membership. Judge F. M. Peasley is the first president, but hereafter the society will have a most original way of electing this officer. On November 1 of each year the winner of the contest automatically becomes president. Thus the president is elected not by humans, but by hens! You may possibly bribe or influence a human being so he will use the ballot box as a trap-nest for laying a bad egg, but you cannot fool or bribe or bulldoze a good hen. When she votes with her eggs you may be sure of an honest ballot. This new organization is a fine thing, for we venture the prediction that egg-laying contests will lay the foundation for a wonderful trade in utility stock. But what if in the future well bred daughters of the Hope Farm man's "scrubs" should elect their owner president?

*

THE European war has brought up a new discussion of the thought that this nation is a collection of European immigrants and their children and descendants. How many foreigners are there in the country? The census of 1910 found 13,515,886 persons who were born in other countries. This was 14.7 per cent. of total population. If we were to include the children of these people—born in this country—we should have about 35 per cent. The following table shows where the larger number of these people came from:

Germany	2,501,181
Russia	1,602,752
Italy	1,342,070
Ireland	1,353,155
Great Britain	1,159,968
Austria	1,174,924
Norway and Sweden	1,069,041
Hungary	495,600

Out of this number there were 6,646,817 males of voting age, of whom 3,034,117 had been naturalized. With this large foreign born population it is but natural that there should be strong national feeling if not race prejudice. Many of our readers have relatives and friends fighting on one side or the other, or suffering hardships in the war zone. It is but natural that they should feel deep sympathy for their native land. Let them, however, remember this: We or our parents came to this country seeking freer and fairer opportunity. We cannot expect such opportunity here for ourselves or our children unless we can keep this nation absolutely free from old world complications and quarrels. Once drag this country into European politics and we do not help Europe, while we do complicate and cripple our own future. Every citizen, no matter where he comes from, should help to keep our country safely neutral in this conflict. Most of us can help most by silence and self restraint.

I NOTICE, on page 1054, you say that to relieve the potash situation more lime will have to be used to release the soil potash. This is true where "burned lime" is used, but you will never get results of that kind from ground limestone. S.

We believe that is true. A sharp chemical action will be needed. Ground limestone is more gentle in its action. We should not, however, place too much dependence on this action of lime to supply potash. Some of the scientists think there is but little power in the lime to make potash available in the average soil. It will be most likely to do so on the heavy clays. Do not expect too much from lime on a sandy or light soil, and do not let anyone convince you that his particular brand of lime is superior.

*

THE New York State Fair passed into the "Exposition" class last year, and this year it went further along the way. Could some old timer have come back to the Exposition this year after an absence of 10 years he would hardly have known where he was. Many of the old faces are missed, but younger and energetic men have come in charge of departments, and there is more and more of a tendency to make the exhibits "educational" in character. At this great show it is possible for a farmer to see and study any variety or breed or any implement or farm product in which he is interested. There was an enormous exhibit of fruit and vegetables. The very size and beauty of this exhibit served to bring out the great, glaring defect in this exposition. This is the dreadful building devoted to the horticultural exhibits. They are now crowded into a poorly arranged, dark place with a roof which admits water like a sieve. On Wednesday there was a sudden and fierce shower, and hundreds songht shelter in this building. They might as well have secured their soaking outside. The rain came down through the roof in streams. Great pools formed on the floor; there was no dry place to be found in all the dark building. It was a disgraceful thing that these great industries of fruit and vegetable growing should be obliged to swim for their lives in a State building!

*

THE opening of public markets in New York City gives a good opportunity to farmers within 50 miles of the city. Housekeepers here are eager to buy produce at a fair bargain. They will go after the goods when convinced that it is profitable to do so. New York is built on a long narrow island, not easy of access with wagons as is the case at Boston, Baltimore or Rochester. That is why in former years the public market plan has not succeeded. To the west there are wide marshes and steep hills to cross before you come to the river, so that the average farmer, with one or two teams, cannot hope to take long daily trips to the city. To make these markets successful coöperative organization must be started. While one farmer may not be able to utilize this market he, with a dozen of his neighbors can do so. A large auto truck with two or three men could transport the produce which now requires 25 horses to move. These horses and at least 10 men would be left free for other work. This truck, running over the fine roads which are found in Northern New Jersey, would move this produce into the city market where the organization of farmers could maintain a store or stall, and obtain retail prices for their goods. That is what many individual farmers near Boston are doing, because they can drive directly into that city with their wagons. New York is so hard to reach from the west side that few individual farmers can hope to use the new markets permanently. A group of them, say 12 or more, within 60 miles of the city, can combine their labor and their capital and more than double the 35-cent dollar, which they must expect to receive as individuals.

*

THERE is one thing about this horrid European War which all people who are able to think ought to consider. Whenever a nation moves nearer to a republic or a more liberal form of government the military spirit weakens, and with it the desire for fighting. How could it be otherwise as men learn more and more how to govern themselves? For centuries the plain, common people were kept poor and subservient by strong military governments. There was nothing for them to do but to produce children and food to build up and feed the army. And what did they get in return? Protection from their enemies! Who were these "enemies?" Plain, common people like themselves who had the same life purposes and desires that they had, and who naturally should be their friends and partners. A few strong men for purposes of their own quarreled among themselves and kept up the fiction that the plain people who did the fighting needed to be "protected." This is the false and cruel proposition which has kept the autocratic military governments in power. Under democracy, where men come nearer and near to governing themselves, about the first thing which intelligent men realize is the folly of spending vast sums of money upon standing armies or war preparations. Democracy brings a sense of personal responsibility and men come to understand that they need no such protection when they can fairly reach men of their own class in other countries. When Norway decided to separate from Sweden there was no war because the working men in both nations agreed that there was nothing to fight about. Yet a few centuries ago a little group of "rulers" in each nation would have started a bloody war in order that their people might be "protected." Now, all this being so, Democracy faces a serious danger in this war. The autocratic, military government is always prepared to fight and strike hard. The more liberal a government becomes the less it is prepared for war, because the very idea of a liberal government is based on the common rights of men and not upon standing armies or ability to fight. The strong warlike nation can trample over the peaceful country before the people can prepare themselves for the fight. Herein lies the greatest test thus far presented to Democracy or popular government. If the republic must stand constantly with sword in hand prepared to fight a brutal and unscrupulous autocratic nation Democracy is in danger as never before, because the world has seen its blessings. These blessings of freedom may actually become a menace if the brutal power of war is to settle national dispute.

*

LAST year the daily papers printed sad stories of disease and death from eating chestnuts from trees affected with the blight disease. Gray squirrels were said to be dying and an epidemic among humans was reported. Careful investigation has been made by scientific men, and the results prove that such stories are simply fakes and nothing more. Not one case could be found where the blighted chestnuts were any more injurious to health than perfectly healthy nuts.

*

A SEED house in Indiana makes a glowing offer of "Marvelous" wheat. The statements are very cunning and plausible, and would lead a farmer to think the wheat is sure to yield 50 bushels per acre from little more than a peck of seed. We have had many letters from farmers asking about this wheat. We have it on the best authority that this "Marvelous" is the old "Miracle" wheat which was boomed so freely a few years ago. It is a good wheat—probably a strain of Fulcaster—but it is incapable of making the great yields which are claimed for it, by this firm. It is sold by reputable seed growers at a fair price, but buyers are told that it is nothing more than a good wheat, and that they should use at least one bushel of seed per acre. The advice to use one peck only is nonsense under general conditions. If you ask how it is possible to induce farmers to pay $3 and $5 per bushel for this wheat we give the answer in this letter from an expert grower:

"It is only on account of the assistance of the so called high-grade farm papers that———is able to get the extraordinary prices he is charging for this wheat!"

You have an entire sermon on the ethics of advertising and the responsibility of journalism in those few lines.

BREVITIES.

THE silent example will spread the sound idea.

A GOOD stockman is known by the culls he gets rid of.

THE balanced ration talk is good, but this idea is best. It isn't the amount you eat but what you can digest.

AS we expected, "feelers" are appearing in some of the papers about wonderful new fertilizers or sources of fertility. Pay no attention to them until the experiment stations give them an O. K.

THE seedsmen will have their troubles this year, for many of the best seeds and bulbs are imported. This year they cannot be sent in large numbers. It will be interesting to see what the seedsmen claim in their catalogues.

IT surely pays on our soil to sow Alsike clover seed. We use half Alsike and half Red. The Alsike will do better on sour or wet places. It might well be Alsike and Red-top for wet sour soils, and Red clover and Timothy for well-drained sweet soils.

MANY cattle are killed each year by lightning—usually when near wire fences. The wires of such a fence should be grounded to prevent such loss. The Wisconsin Station says: "To secure the best results ground wires ought to be placed about 100 feet apart and closely stapled to the post, so as to form a contact with every one of the fence wires. The ground wires should also extend slightly above the fence post, and like a lightning rod, should penetrate the soil far enough to reach moist earth. No. 8 or 9 wire is most satisfactory for this purpose."

NEW YORK'S NEW RETAIL MARKETS.

NEW YORK has for a long time been far behind other large cities in retail market facilities. The present city administration is attempting to remedy this, and on September 1 four localities in various parts of the city were set apart as free public markets. One is at the Fort Lee Ferry, 130th St. and Hudson River. This is convenient for New Jersey farmers and has a large consuming population reasonably near. The second is at 129th St. and Third Avenue; third, under the Queensboro Bridge, 59th St. and First Avenue; and the fourth, under the Manhattan Bridge, near Canal Street and Second Avenue. The last three are accessible to an immense number of people and can be reached by farmers from Long Island and Westchester County.

These markets are for the sale of foodstuffs only. No charge is made for space, which is open to farmers, peddlers and grocers. Police and other city officials are on hand to see that everything is orderly and weights and measures honest.

On the first day business was a little late in starting but developed considerable proportions before noon. There were plenty of push carts and peddler's wagons, but only a few farmers, though it is expected that more will be on hand later. Many farmers near New York are specialists, hauling solid loads of one kind—7,000 ears of sweet corn, 1,200 cabbages, etc. They usually sell such loads to grocers in large quantities or deliver to commission houses in a lump There are, however, farmers who can make up mixed loads suitable for retail trade, and no doubt they will take advantage of this opportunity for direct selling.

West Street, New York, from 12th to Cortlandt, is another locality specially adapted to retail market business. This is a very wide street where wholesalers are given large amounts of space for piling their goods, trucks are stored over night and Sundays, and there are spaces big enough for ball games. Yet there is still room for several retail market sheds. This place is accessible to New Jersey and Long Island farmers, but its chief advantage is that produce can be unloaded from the docks to the retail stands with hand trucks, thus cutting out one of the heaviest middleman's expenses, trucking.

This movement for more and better markets is a most hopeful sign. The old Washington Market is being built over according to the most modern ideas of convenience and sanitation, and with a large number of curb markets like those just established, where produce can be sold at the smallest possible handling expense, all classes of consumers in New York should be in conditions to keep the "cost of living" to the lowest consistent figure.

NEW YORK STATE NEWS.

FARM BUREAU NEWS.—Nassau County has just been added to the list of counties having farm bureaus. L. R. Simons is the manager. For the past three years he has been teaching agriculture in the Gowanda high school. What is styled as the largest farm bureau meeting ever held was that at Crystal Lake last month, when the bureaus of Allegany, Cattaraugus and Erie Counties united in a field meeting and picnic which was attended by more than 3,000 people. The Erie County Bureau has established, by privately raised funds, a home economics department and Katherine H. Mills, a Cornell graduate, conducts it. The Jefferson Bureau has become much interested in the growing of Timothy hay, and on August 25-28 the first annual Timothy hay show was held at Watertown. The farm bureau manager has interested many farmers in the growing of improved types of heavy yielding Timothy. Each grower brought to the show his 10 best individual plants of Timothy which were judged by competent men and prizes were awarded. H. M. Doyle has resigned as manager of the Oswego County Farm Bureau and on Sept. 1 his place was taken by E. V. Underwood, a former teacher in the Moravia high school.

NEW LAWS IN EFFECT.—Eighteen new laws went into effect on Sept. 1. Nine amend the code of civil procedure, four the penal law, three the code of criminal procedure, and one each the educational and agricultural laws. Hereafter all exceptions of criminals must take place at Sing Sing prison. It is made a misdemeanor to wear the badge or button of the Grand Army of the Republic or other organizations unless entitled to use such emblem. The educational law pertains to the registry of municipal bonds and the agricultural law provides that a certificate of inspection by the State Agricultural Department must be attached to every shipment of fruit-bearing trees, together with a label specifying the name or variety of the trees. Agents selling trees must carry a certificate showing their authority to act.

STATE GAME FARM.—The conservation commission has purchased, subject to a good title, the so-called Tamblin property in the town of Brownville, Jefferson County, as a site for a new State game farm. It consists of 240 acres and the purchase price is $7,000. The remainder of the appropriation of $25,000 will be used in the erection of suitable buildings and equipping the place with game birds.

IN COLD STORAGE.—The State Department of Health is in charge of the administration of the cold storage law which was enacted in 1911 to prevent the storage of improper food and the maintenance of a supply in storage beyond a definite period of time. The law allows butter to be kept in storage for 12 months, but any other article of food with the exception of fruit, nuts, cheese and vegetables, cannot be kept in storage for a longer period than 10 calender months. On August 1 the following articles of food were in cold storage in this State: Eggs 20,441,667 dozens; butter 10,883,018 pounds; fresh meats 10,609,352 pounds; poultry 7,621,305 pounds; pickled, salted and smoked meats 3,370,692 pounds. These figures indicate a very large increase in storage products such as named since May 1, except in poultry which shows a large decrease.

HOLSTEIN BREEDERS ORGANIZE.—The Eastern New York Holstein Breeders' Association was organized at Pawling, Dutchess County, recently. A large membership is anticipated as the Holsteins are very popular in that county. The officers are L. L. Lawson, LaGrangeville, president; Paul T. Brady, Patterson, vice-president; Towner Kent, Patterson, secretary-treasurer.

COMMISSIONER HUSON ON THE GRANGE.—In an address to the boys in camp at the State Fair Commissioner Huson emphasized the importance of farmers' organizing and said of the Grange that it exerts more influence than all of the other farmers in the State combined. The members are persistently watching all legislation that might affect the farmers of the State in the slightest degree. The members stand together for their mutual benefit. He further said that although the Grange has a membership in the State of more than 115,000 yet only about eight per cent. of the farmers of the State are members.

ALTON HAS FRUIT EXCHANGE.—Another branch of the Eastern Fruit and Produce Exchange has been organized at Alton, Wayne County, which will cooperate with the one recently organized at Sodus. The officers of the Alton Exchange are, president, Arthur Sill; vice-president, Arthur Gatchell; secretary and treasurer, M. F. Shannon; manager, Isaac Wagemaker. Packing houses will probably have to be erected at both places above named to accommodate both fruit growers and vegetable farmers at shipping time.

DAIRY AWARDS AT N. Y. STATE FAIR.

IT is the custom of the management of the New York State Fair to have the awards on butter and cheese all placed before the Fair opens its gates, and this work was completed on Saturday night preceding the opening. Each exhibit of butter and cheese is marked with a card on which is inscribed the number of points scored in the competition. The gold medal for the best butter exhibited in all classes was won by the Richardson-Beebe Company of East Aurora, with a score of 97. The silver medal went to the Rosemary Creamery Company of Adams, Jefferson County, with a score of 96¾. H. L. Smith of Crittenden won a special cash prize of $10 for having the highest average score in the three creamery butter classes.

In the cheese classes the highest honor—a gold medal—was carried off by John Lonkow of East Otto, Cattaraugus County, with a score of 99⅛. Carl Bolander of Falconer, gave Lonkow a close race with a score of 99 which won for him the silver medal. For the highest average in the cheddar, young American and sage cheese classes C. Gray of Omar, Jefferson County, took the special cash prize of $10. The Shefford Cheese Company of Syracuse won the $25 prize in the class for

FIXING THE BLAME.

THE MIDDLEMAN'S EXCUSE.

From the New York World.

cheese made by one concern, variety and attractiveness considered. H. S. Sweetland of South Dayton, Cattaraugus County, took the second prize of $10.

All competitors in the butter classes scoring above 90 share in the pro rata cash prizes in the ratio of the number of points in excess of these figures. In the cheese department the contestants must score above 92. There are a large number in each class. The pro rata prize in Class I (butter) $150; in class 5 (same) $75. J. W. D.

A SUCCESSFUL FARMERS' CO-OPERATION.

The Way to Combine is to Get Together.

PART I.

LARGE RETURNS.—If an incorporated stock company were to advertise stock and promise returns of nearly 500 per cent. profit annually, it would be branded immediately as a "get-rich-quick" scheme. Farseeing financiers would say that such an investment was neither practical nor possible under existing conditions. However, it is actually a fact that nearly 500 farmers in Chautauqua County, New York, have purchased less than $2,500 worth of stock in the South Shore Growers' and Shippers' Association and have realized almost $25,000 of profits in two years. Startling statement to those who do not believe in cooperation, but here is the story of such a venture. And after you have read it, you may be converted to the idea that where there is a will there is a way—especially among this class of farmers.

CONDITIONS INVOLVED.—Chautauqua County farmers are composed of three separate classes, as regards occupations. Dairying is almost the sole business among the farmers of southern Chautauqua, while fruit raising and gardening is left almost entirely to the region along the southern shore of Lake Erie. This is a strip of land about four miles wide, and running back from the edge of the water to a range of hills that is the divide between the Saint Lawrence and the Mississippi basins. Here is found the great Chautauqua grape belt that produces two million dollars worth of Concord grapes annually. This is the home of the unfermented grape juice industry and over four million gallons of the "national drink" were manufactured in this section last year. Three railroads skirt the shore of the lake and along the railroads are found more than a dozen thriving towns. In five of these, at Farnham, Irving, Silver Creek, Fredonia and Forestville, are found canning factories. Surrounding these factory towns is naturally found the gardening section, where for 25 years, the farmers have grown vegetables for the canneries. Tomatoes seemed to be the principal crop, although other produce was grown in smaller quantities. There was very little chance to market produce except to the canneries, and both farmer and canner knew this, but the advantage was all with the canner. The farmers were practically compelled to contract, during the Spring, for all the produce they expected to grow that season. The contracts offered were very unsatisfactory to the grower in many ways. Payment for produce was not made until December first or even later. The canner agreed to furnish baskets and containers for all produce, but failed miserably, generally, with the result that tons of produce rotted in the field at a total loss to the grower. If the grower protested or kicked about the conditions the canner simply annulled the contract which left the farmer without any market for his product.

TROUBLE WITH CANNERIES.—The average American farmer will permit himself to be imposed on for a certain length of time, and then will turn and fight with a vengeance for his natural rights, and the Chautauqua County vegetable growers are no exception to the rule. In 1911 a very large acreage of tomatoes was contracted with the canneries. During tomato harvest that Autumn the canneries failed, as usual, to furnish the grower with enough baskets. And to this fact might be traced directly the beginning of the South Shore Growers' and Shippers' Association. One day in September when tomatoes were ripening by the ton and baskets were scarcer than discontent, two large tomato growers were discussing the situation. One said to the other: "Cook, we ought to have an association to handle this tomato deal with the canneries. We've got to do something pretty soon or quit the business." Other growers joined in the discussion, and the cooperative idea spread so rapidly that it resulted in a meeting being called in Silver Creek. Fifty large tomato growers were present and it was the unanimous opinion of those present that a farmers' association would be a good thing for the community. A second meeting was held, this time at Sheridan, and the outcome was the organization of the South Shore Growers' and Shippers' Association.

FORMATION OF THE ASSOCIATION.—The new association was incorporated on December 28, 1911, with a capital stock of 1,000 shares of $5 each. The office was in Silver Creek and the officers were: President, F. M. Cockburn; secretary and treasurer, H. K. Palmer, who was also manager. A board of five directors was also chosen. The only salaried office was the manager. The first certificate of stock was issued January 16, 1912. During the next 30 days 110 shares were issued. The stock money paid in was used to purchase the necessary office equipment, and the association immediately began business.

THE TOMATO QUESTION.—Tomatoes were the one important issue. The canners had been paying $7 and $8 per ton. When the new association started negotiations with the canneries it demanded a more satisfactory contract, better basket conditions and an increase to $9 per ton. It was claimed with good cause that the crop was not profitable at $7 and $8 a ton. It was claimed that it actually cost $55 to raise an acre of tomatoes that would produce an average crop of eleven tons. The land was worth $150 to $250 per acre and a net profit of less than $40 was not considered very satisfactory. The canners gave little thought to the new factor, and absolutely refused to do business with the association, regardless of the price per ton. Furthermore they consistently kept signing up tomatoes with private farmers who had not joined the association. Consequently, the manager began hunting elsewhere for a tomato market. It was found that there were many firms using an immense tonnage of tomatoes annually, but few of these concerns seemed willing to depend on an association unknown, and of only recent existence, for their supply of tomatoes. However, at the last moment, a large Pittsburg pickling and canning concern agreed to purchase 500 acres of tomatoes at $9 per ton. The news of this large contract spread rapidly, and caused the new association to be looked upon as a factor of no mean proportion by the canning interests. Meanwhile the secretary and treasurer, Mr. Palmer, had moved from the vicinity, and Mr. S. J. Cook, one of the first promoters of the association, was elected to the office and made sole manager. C. R. BERGER.

THE WAR AND COMMERCE.

MAKERS of white glass are in difficulty because of the scarcity of oxide of manganese, made in Germany. The price has gone from $28 to $210 per ton. One ton is required for every 20 of the glass. Because of the danger to shipping in the North Sea, there is getting to be a shortage of wood pulp from Sweden, which furnishes two-thirds of the imports into the United States. Wood pulp prices have doubled, unbleached now selling at 2½ cents and bleached 3¾. All paper except newsprint has advanced. The news print concerns make their own pulp here. The foreign pulp is used in wrapping paper of various kinds, and the best grade bleached, which comes mainly from Germany, in ledger, bond and other high quality writing paper.

Jute used in baling cotton has become so scarce that cotton may be put up in its own fiber this year. The jute comes from India and the Far East.

Germany's exports to Great Britain have amounted to about $400,000,000 per year. Some items during 1913 were: Timber, $230,000; clocks, $180,000; steel girders, $160,000; steel bars, $700,000; woolen rags, $130,000; silk manufactures, $600,000; paper, $620,000, leather, $600,000.

The following nations have decreed a moratorium, or suspension of debt collection by legal process, for periods of one to two months to prevent undue pressure on debtors who, because of the war, are unable to meet their obligations as would be possible normally: Great Britain, France, Norway, Russia, Bulgaria, Egypt, Italy, Sweden, Switzerland, Turkey, Brazil, Argentina, Ecuador.

The market on grains was less active during the week, the prices being so high as to check buying. Wheat declined from two to five cents. There are now ample shipping facilities to Europe, particularly from gulf ports, where boats are usually crowded with cotton at this season. Foreign buying of oats is very heavy at full last week's prices. Demand for flour has slackened owing to the high prices demanded by the mills.

Important exports from New York from August 1 to 20 were: Sugar, 27,234,539 pounds; wheat, 755,681 bushels; flour, 139,931 barrels; lard, 6,641,644 pounds; bacon, 4,422,500 pounds. The total value of all items was $6,193,632. Great Britain was the heaviest buyer, taking 26,371,234 pounds of sugar, 4,377,695 of lard, 457,348 bushels of wheat, 26,424 barrels of flour, 3,861,263 pounds of bacon. The Netherlands took 1,332,015 pounds of lard; Denmark, 148,700; and West Indies, 197,359.

Woman and the Home

From Day to Day

COURAGE.

Because I hold it sinful to despond,
And will not let the bitterness of life
Blind me with burning tears, but look beyond
Its tumult and its strife;

Because I lift my head above the mist
Where the sun shines and the broad breezes blow,
By every ray and every raindrop kissed
That God's love doth bestow;

Think you I find no bitterness at all,
No burden to be borne, like Christian's pack?
Think you there are no ready tears to fall
Because I keep them back?

Why should I hug life's ills with cold reserve,
To curse myself and all who love me? Nay!
A thousand times more good than I deserve,
God gives me every day.

And in each one of those rebellious tears
Kept bravely back, He makes a rainbow shine;
Grateful I take his slightest gift, no fears
Nor any doubts are mine.

Dark skies must clear, and when the clouds are past,
Our golden day redeems a weary year;
Patient I listen, sure that sweet at last
Will sound his voice of cheer.

Then vex me not with chiding. Let me be.
I must be glad and grateful to the end,
I grudge you not your cold and darkness—me
The powers of light befriend.

Celia Thaxter.

*

HUCKLEBERRY tarts are delicious. Line pattypans with good pie crust. Beat two eggs with 2½ tablespoonfuls of sugar, stir in enough ripe huckleberries to make the mixture stiff, and add a little nutmeg or other spice. Fill the patties with this mixture, and bake.

*

THERE is a little girl in Springfield, Massachusetts, says the Youth's Companion, who, like many of her sex, resents the imputation that the feminine mind is not so strong as the masculine. One day her mother remarked on the apparent lack of intelligence in a hen. "You can't teach a hen anything," she said. "They have done more harm to the garden than a drove of cattle would. You can teach a cat, a dog or a pig something, but a hen—never!"

"H'm!" exclaimed the child, indignantly. "I think they know just as much as the roosters."

*

RECENT newspaper dispatches state that owing to the anticipated shortage of flour in Holland, bakers are already making bread from a mixture of equal parts of wheat, cornmeal, and potato meal, to which is added a small quantity of albumen. It is said that this bread is of good color and flavor, though rather close in texture. We infer that the potato meal referred to is what we buy as potato flour, from which we make our most delicate cake. This potato flour is made in Sweden, and sponge cake made from it is, as one appreciative person declares, light enough to fly right off the plate. It would be a good thing for American farmers if we could have this potato flour made here, instead of importing it.

*

WE are getting so much war literature these days that when we read for recreation we like to get as far away from it as possible. However, among recent novels there are three that will give a vivid idea of the people and the countries now involved in Europe; they are "The Children of Alsace," by René Bazin, which gives modern conditions in Alsace from the French point of view; "The Iron Year," by Walter Bloem, a German novel of the Franco-Prussian War, and "Red Wrath," by John Oxenham, an English story of the same war. "The Last Shot," by Frederick Palmer, and "Midstream," by Will Levington Comfort, both books by American war correspondents, give painful pictures of real war. In hideous realism, however, they are all exceeded by a new English book called "War," by W. Douglas Newton, which describes, in narrative form, the slaughter of scientific warfare, and the sufferings of a conquered people.

The Rural Patterns.

In ordering patterns always give number and size desired. Price of each pattern 10 cents.

7867, Girl's dress. Cut in sizes 6 to 12 years. Size 8 requires 2 yards of 36 or 44 inch material with ⅜ yard 27 inches wide for trimming and ⅝ yard for belt. 8208, Girl's long-waisted dress. Cut in sizes 4, 6 and 8 years. Size 6 requires 2 yards of 36 or 44 inch material for dress, with 1 yard 27 inches for trim-

ming and 1⅛ yards for bloomers. 7545, Middy costume for misses and small women. Cut in sizes 14, 16 and 18 years. Size 16 requires 5¾ yards of 36 or 44 inch material, with ⅝ yard 27 inches for collar and cuffs. 7478, Child's princesse slip or petticoat. Cut in sizes 2, 4 and 6 years. Size 4 requires 1½ yards of 36 or 44 inch material with 2 yards of embroidery; 2¼ yards of insertion and 1½ yards of edging. 7891, Child's dress. Cut in sizes 2, 4 and 6 years. Size 4 requires 2½ yards of 36 inch material.

8298, Ladies' surplus blouse. Cut in sizes 34 to 42 bust measure. Size 38 requires 1⅞ yards of 36 or 44 inch plain material. 8358, Basque with sash extensions. Cut in sizes 34 to 44 bust measure. Size 40 requires 3⅜ yards of 36 inch material with ⅜ yard 27 for collar and cuffs. 8145, Semi-princesse gown. Cut

in sizes 34 to 42 bust measure. Size 38 requires 4½ yards of 27 or 36 inch material. 8363, Two-piece skirt with tunic for misses and small women. Cut in sizes 16 and 18 years. Size 16 requires 2¼ yards of 27, 36 or 44 inch material for skirt with 2¼ yards 36 inch for tunic. 7877, Ladies' two-piece skirt. Cut in sizes 22 to 32 waist measure. Size 26 requires 2⅝ yards of 36 inch material.

No. 818. Design for embroidering an oval doyley twenty-three inches in length by sixteen inches in width. The scalloped edge is to be padded and buttonholed. The roses are to be worked in long and short stitch with the stamens of the flowers outlined and the centers of the

flowers in French knots. The leaves may be worked either solidly or in long and short stitch with the veins outlined and the buds and calyces are to be worked in solid embroidery. Stamped on pure white linen 18x24 inches, with mercerized floss to work, 35 cents.

Grapes Without Sugar.

WILL some of your correspondents tell me whether grapes can be canned without sugar? I have canned huckleberries and currants and had them keep perfectly, but have never tried grapes. I have quantities of them this year, but sugar is very high and my pocketbook is very thin. J. M. R.

Connecticut.

Most of us feel that our pocketbooks are thin when it comes to buying sugar this year, but a private letter from a little town in Holland received the end of August stated that the writer had to pay 25 cents a pound for salt, 50 cents a pound for sugar, and $1.50 a pound for butter. We have never canned grapes without sugar, and believe very careful sterilization would be necessary to avoid fermentation. No doubt some one who has experimented can give us her experience. The following method of canning grapes is quite economical of sugar, and gives good results, the flavor being very fresh: Stem the grapes carefully, without breaking the skin, and pack solid in jars. Make a syrup of one-half cup sugar and one cup water for each jar; if this does not flush it full, add more water. Lay tops on jars, without screwing down; set in large kettle, standing on rack or folded cloths, pour in hot water, until it is within three inches of the top of boiler, then bring to a boil, and let boil for one hour. Draw back and remove the jars, screw down tops, and when cool store in a dark cool place.

Drying Mushrooms.

CAN you advise me how to dry field mushrooms? MRS. M. C. C.

Mrs. Rorer gives the following instructions for drying mushrooms: Wipe and peel the mushrooms. Cover pie plates with white paper, lay the mushrooms on them, and put in a cool oven until dry. When quite dry and shriveled store in paper bags. We think it is wise to put the mushrooms on the warming shelf over the range, covered to keep off flies, until quite sure they are fully dry, as they are very succulent. They should be very fresh, and picked over carefully before drying, to avoid insects. Mushrooms are very largely dried in Europe both commercially and in domestic use.

APPLE SAUCE CAKE.—One cup of sugar, two cups of sifted flour, one-half cup of shortening, one teaspoon of cinnamon, one teaspoon of soda (strictly level), one-half teaspoon each of cloves and nutmeg, one cup of chopped and seeded raisins, sprinkled with flour, one cup of unsweetened, very sour apple sauce beaten smooth. Note that no liquid, baking powder or eggs are used. If the apples are not very acid, add to them one level teaspoon of cream of tartar. Sift together the dry ingredients except the soda. Cream the shortening, beat until light with the sugar, add the soda dissolved in one tablespoonful of warm (not boiling) water. Beat in the apple sauce, add the raisins, then the dry ingredients. May be baked in layers with an apple or raisin filling or bake in loaf and frost with a plain white frosting, or it may be served as a pudding with sweet sauce or whipped cream. MRS. E. M. S.

GOOD looks are not at our command; they are a gift of the gods; but good, straightforward manly appearance, and appearance without self-consciousness—which is the most disagreeable feature perhaps of all appearance—is within the command of every boy.—Lord Rosebery.

Tomato Relish.

I WOULD suggest that the recipe for tomato relish, page 1037, should also contain horseradish to make it keep without cooking. I enclose one which will keep in a crock, and which requires no cooking: One peck ripe tomatoes chop fine, skinned; add one-half cup salt and let stand over night. Drain out juices (which can be boiled down and added to soup); add three onions chopped, three green peppers and three roots of celery, use stalks also: two ounces white mustard seed, one ounce cinnamon, 1½ pints vinegar, grated horseradish, one cupful sugar to taste.

MRS. R. E.

Canning Corn.

I SHOULD like to tell the readers, some of whom, perhaps, have not tried this way, how I can my sweet corn. It always keeps well for me, and is nearly as good as new corn. To 10 cups of corn add one cup sugar and one-half cup salt. Do not add much water if any, and cook in a kettle till it is heated all through; let it bubble up, but keep it stirred so that it will not scorch on the bottom of the kettle. When thoroughly heated through, pack it in glass cans, with new rubbers, and seal, and it will keep the year round. It does not need freshening when you open a can, just add sufficient milk to cook, or rather to heat it up in and it is ready for the table, with the addition of a little cream and butter.

D. N.

Seen in New York Shops.

AMONG the new blouses for Autumn wear are some of white chiffon with colored coin spots; they have high lace collars wired at the back. Hand-painted chiffon with sheer lace, and hand-painted lace with chiffon cost from $6.50 up; they are not very striking, and are extremely perishable. A beautiful but simple blouse that costs $10 is white crepe meteor with long tight-fitting sleeves, Napoleon revers and a vest of fine lace. Another handsome model costing $8 is dark striped crepe de chine with a white collar and waistcoat, fastened with very large pearl buttons. These are all new French models, which are likely to be largely copied.

Some very attractive materials are new challis having a dark background with a pattern in tiny colored flowers, very similar to the patterns shown in flowered silks. They are all wool and 50 cents a yard.

Long transparent sleeves were a sudden variation in the basque dresses; some of the sleeves were of lace, others of net or chiffon. The lace sleeves are perfectly plain and tight-fitting; the net sleeves are sometimes tucked, or rather loose, and gathered into a cuff. Some of the basques have a dropped shoulder, the transparent sleeves seamed to this with a piping, while in other cases there is a large armhole, the transparent sleeve forming part of a guimpe which makes a vest in front. Some of these transparencies are so extremely diaphanous as to be rather startling. Then there are net over-blouses of the kimono shape, which are worn over plain waists, very often, it must be confessed, with a somewhat scrappy effect. These over-blouses are plain kimono shape, V-neck back and front, and loose elbow sleeves; those of white net are often edged with narrow black net pleatings. Their proper use is over a slip of silk or crepe de chine, but unfortunately a great many women seem to think they can freshen up any rather shabby waist with this net covering, and the effect is not happy.

Ribbon trimming is seen on many new gowns, some of the tunics being trimmed with five to seven bands of ribbon in graduated widths. Both satin and velvet ribbons are used. This is a revival of an old style which is always pretty.

Some pretty little rompers were of pink or blue chambray. They are made with a full-length closing down the back, and also open across the bottom edge, underneath, from one knee to the other. There is a wide belt and little patch pocket on one side, a round collar and cuffs of piqué, and a dog worked in colored cross-stitch on the left side. This makes a very pretty garment, as well as a serviceable one.

Corduroy and other velvety materials are likely to be very popular for Fall and Winter, both for gowns and suits. They are in rather dark shades as a rule, pheasant and prune being two fashionable corduroy colors, also a variety of grays. We have seen a number of beautiful costumes of mouse-colored velours or plush. Some of these have a velour Russian blouse edged with squirrel fur.

Cheese as a Meat Substitute.

WHILE meat is so high priced cheese may be used in many ways as a substitute. It is very nourishing, but many people find it rather hard of digestion. However, we usually find that when mixed with milk, bread, etc., and made into cooked dishes, it is more readily digested than when served uncooked.

French Rabbit.—Butter a baking dish and cover with broken bread. Over this sprinkle grated cheese, then another layer of broken bread and so on until the dish is full, having cheese on top. Pour over this one cup of cold milk into which has been beaten one egg, also two dessert spoons of hot water. Bake in a moderate oven.

Cheese Turbot.—Prepare a cream dressing of one pint of milk, one ounce of butter and one-half ounce of flour. Season with one saltspoonful of salt, two or three dashes of pepper and a pinch of mace. Into this dressing turn four ounces of grated cheese. Butter a pudding dish, then fill with alternate layers of this mixture and bread crumbs. Bake a golden brown. Serve hot.

Cheese Scallop.—Soak one cup of bread crumbs in fresh milk; beat into it three eggs, one tablespoonful butter and one-half pound of cheese. Strew the top with sifted bread crumbs, and bake in the oven a delicate brown.

Molded Macaroni and Cheese.—Cook three-fourths of a cup of macaroni, broken in small pieces, in rapidly boiling salted water half an hour. (Add a teaspoon of salt to a quart of water). Drain, then add a cup of milk and cook until the milk is absorbed; then stir into one cup of seasoned white sauce (use three tablespoons of flour in the making), add two tablespoons or more of grated cheese, and when cooled a little, a beaten egg. (Two are better). Turn into a buttered border mold sprinkled with bread crumbs and poach, standing in a pan of hot water, about twenty-five minutes. Turn from the mold and fill the center with stewed tomatoes.

Pepper and Cheese Custards.—Scald one cup of milk, add six tablespoons of grated cheese, and stir until the cheese is melted, then add two eggs slightly beaten and season with salt and paprika. Butter six individual molds generously and sprinkle with chopped red or green pepper, fill with custard, set in a pan of hot water and cook until firm.

Honey Drop Cookies.—Take one cup of sugar, one cup honey, one cup buttermilk, one-half cup sour cream and flour to thicken, with one teaspoon of soda. Drop by spoonfuls in cooky pan and bake in hot oven.

M. D. B.

SWISS CHARD.—Boil the leaves until tender, let drain, run through food chopper, put in kettle and cook for 10 minutes in any gravy. If chicken is the meat for the meal use chicken gravy, if pot roast use the gravy from the pot roast, or if roast lamb or mutton or pork use the gravy from any of them. We prefer this to spinach. We also can it for Winter use and we have greens as good as fresh greens any time during Winter.

K. A. C.

IRISH potato scones are very good; the secret of making them is to prepare them quickly, with very little handling, and have a good oven ready to receive them as soon as molded. Sift together two cupfuls of flour, half a teaspoonful of salt, and 1½ teaspoonful of baking powder. Then rub in lightly two tablespoonfuls of cold mashed potatoes and a teaspoonful of butter. Moisten to a soft dough with very cold milk, turn quickly out on the bread board, roll lightly to half an inch in thickness, cut into biscuits, and lay on a well-greased baking sheet or pan. Brush over with beaten egg, and bake in a quick oven for 15 minutes.

THE first lesson of life is to burn our own smoke, that is, not to inflict on outsiders our personal sorrows and petty morbidness, not to keep thinking of ourselves as exceptional cases.—James Russell Lowell.

This Skirt Only $2.98

11A73—This is the very new and very fashionable Russian Tunic Skirt—and a genuine bargain at the "NATIONAL'S" low price of $2.98. It is made of "NATIONAL" All Wool Worsted Serge, chemically tostod for quality, color and serviceability, and the workmanship is up to tho "NATIONAL'S" usual high standard. It displays a stylish girdle-top and is smooth-fitting around the waist and hips. Tho tunic hangs in graceful lines and overlaps a fashionable plaited section, which gives comfortable width to the lower edge. Percaline foundation under the tunic. Invisiblo side closing.

COLORS: black, tan, or navy blue; SIZES: 22 to 30 inches waist measure; 36 to 44 inches front length. This is a good example of "NATIONAL" money-saving bargains. It is well worth $4.00. Order it today.

Postpaid, **$2.98**

15A73

15A73—Boys' new style Norfolk Suit. Coat has yoke and plaits to waist-line, front and back alike. Twill lining. Full-cut knickers lined throughout. Live Stock and Dairy

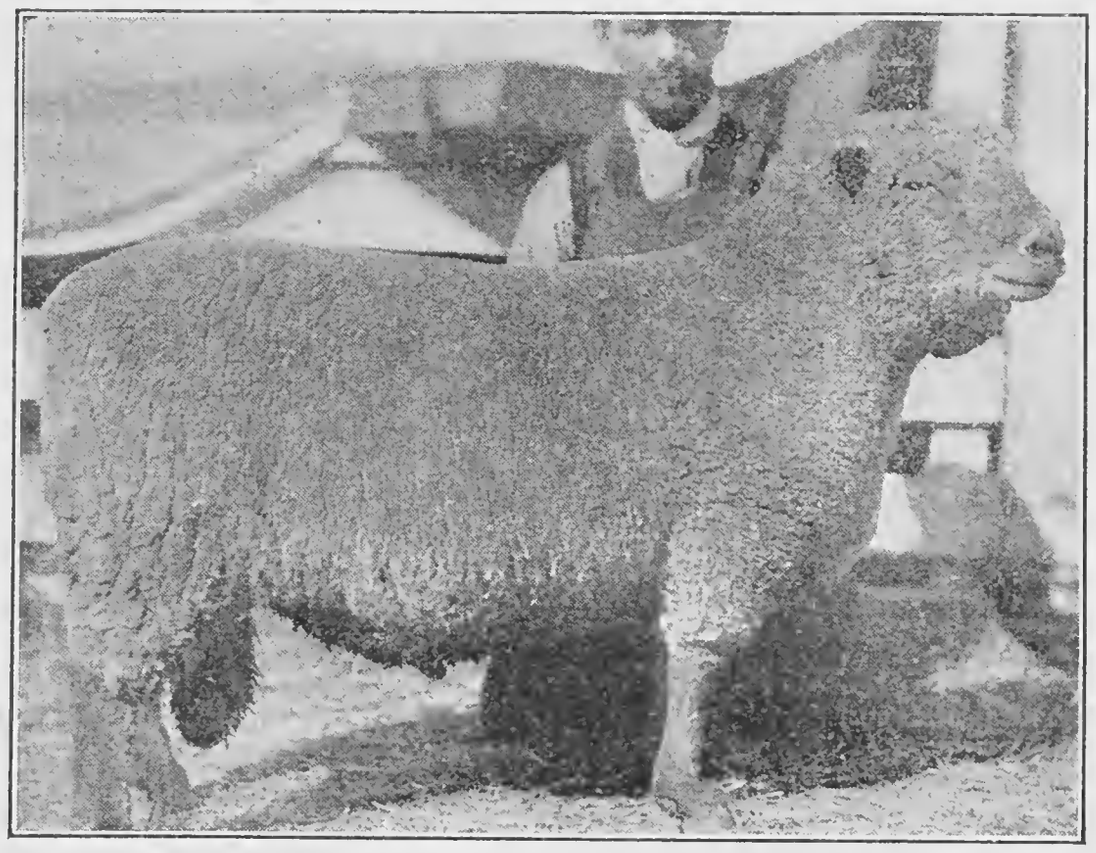
SOME BREEDING MYTHS EXPLODED.

IF memory serves us aright we have previously stated in these columns that there are no such diseases as "hollow-horn" or "wolf-in-the-tail" of cattle, and that the signs of the zodiac have no influence, good or bad, upon man and his mundane affairs. There are other myths, believed in by many farmers, which need "exploding" here.

Two of them are well brought to our attention by inquiries received by the writer. A New York State horseman writes: "Will you kindly inform me if any injury is likely to result from the use of an overhead check when driving a brood mare that is in foal? *Will the foal be marked?*" The other anxious inquirer writes that his English Shire stallion has a white face, which is highly objectionable to his patrons, and wants to know



A GOOD SPECIMEN OF SHROPSHIRE.

if we can tell him how to dye the white face black to prevent the colts from being marked with white faces. He adds that meanwhile he is careful to *blindfold the mares* mated with this horse so that they will not see his white face.

The writer of the first inquiry evidently believes that anything accidentally injuring or unnaturally affecting a mare in foal may have an injurious effect upon the offspring. The second man believes that foals unborn may be marked by things seen by the dam. Both of these beliefs are erroneous.

The tight over-check distorts the neck it tortures. Such a check strap is cruel, unnecessary and certainly detrimental to the mare; but the distorted "ewe neck," caused by the check, will not be reproduced in her foal. The foal may be injured to a certain degree, as regards nutrition and development, if constant wearing of the check impairs the appetite and thrift of the mare, so that she frets, weakens and loses spirit and flesh. The development and health of the fetus (unborn young), apart from the influences of heredity, are largely dependent upon the nourishment and health of the dam. Lack of feed, over-feeding, damaged feed, unsuitable feed, indigestion, constipation, or the reverse, and sickness or disease causing fever or undermining the strength, irritating the nerves and leading to emaciation may lead to the death and expulsion of the fetus (abortion), or malnutrition indicated by smallness and weakness or rickets of the offspring at birth. Distortion of the neck is an accidental condition; not hereditary. Accidental or induced distortions or mutilations are not hereditary, and are not transmitted to the offspring. For example, dishorning of cattle and docking of dogs do not induce hornless calves or curtailed dogs. This is equally true of docked Hackney horses and domesticated sheep. In the same way a sire is not hereditarily injured for breeding purposes by a fracture which causes distortion of a limb, or by an accident which causes lameness and wasting of the tissues of a foot, joint or muscle. These are acquired blemishes, and are not transmissible.

The man who keeps mares from seeing the white face of his Shire stallion believes in a very ancient myth. It was first suggested in the Biblical account of Jacob with his peeled rods and ring-straked, speckled and spotted sheep and goats (Gen. xxx:32-43). It is said to have been believed in by that old-time successful breeder of Aberdeen-Angus cattle, William McCombie of Tillyfour, Scotland, and that he therefore had all of his fences and farm buildings painted coal black so that his "bonnie black doddies" (mulleys) might not become off colored, or rather, might be influenced to remain black in color. The Shire stallion marks his progeny with white faces because that marking is a hereditary feature and characteristic of the breed, just as the exuberantly "feathered" (haired) legs of this noted draft breed are characteristic. One could no more prevent Shire foals from coming with white faces by enveloping the stallion's or mare's head in a gunny sack, or painting it red or blue, than he could prevent "feathered" legs by lopping off a limb or clipping the legs of a Shire mare or stallion. Offspring is not marked by what the sire or dam sees. There is no danger in that respect to a Jersey herd from pasturing "over the fence" from a Holstein herd.

At one time it was commonly believed that mating with a certain sire leaves a temporary or indelible impression upon the mind of the female or "taints" her womb so that subsequent offspring from a different sire will "favor" or be "marked for" the previous mate. We find that this myth still has many believers, so that a word on the subject will not be out of place in this article. The theory referred to is technically termed "telegony" and it has been perfectly disproved by prolonged, exhaustive and conclusive experiments made by Prof. J. Cossar Ewart of Scotland. He mated pony mares with zebra sires and obtained striped hybrid foals. The same mares were next mated with pony sires of their own breed and color. Every possible combination of breeding of this sort was tried, but not in a single instance did any foal from a pony sire and pony dam show the slightest trace, at birth or maturity, of the zebra sire previously used. This proves conclusively that when a mare has a mule foal to a jack and is subsequently bred to a horse the offspring from the latter mating is not in any way influenced or marked by the previous jack sire. No impression or "taint" remains with the female. The characters and markings of her offspring, by sires of her own breed, are wholly determined by heredity. This is true of all the animals from which we breed, therefore the man whose purebred Guernsey cow has had a calf to the service of a roaming scrub bull is injured only to the extent of the difference in market value of the scrub calf and the calf that would have resulted from mating with a purebred Guernsey bull. He cannot obtain "damages" for mythical injury to the future reproducing qualities of the purebred cow. Thousands of instances have been advanced by breeders in seeming disproof of these asser-

JUSTICE TO THE RAZORBACK.

THE razorback hog is generally personified as the essence of all that goes to make up the unregenerate scrub. His long snout, his bristly back and gaunt unlovely frame, have furnished theme for unbroken satire and ridicule. He appears doomed to go down in history as a synonym of intractability and general worthlessness. And yet when we look critically into the life of the razorback and the conditions under which he was required to live, we find many redeeming features and are driven to conclude that his personality was, after all, only a case of the adaptation of an animal to its environment. The razorback, like certain restless human characters flourished only on the frontiers of civilization. Originally found throughout the Ohio River Valley States, he has gradually retreated into the uncleared swampy bottoms and canebrakes of the Southwest. Here he can still be found, but in constantly diminishing numbers as his domains are contracted by ax and plow. The razorback was the natural logical product of his wild environments. The modern farmer with his sleek Berkshires and Poland Chinas, from whom all straight lines and angles have been eliminated, is prone to regard not only the razorzack, but the man who claimed his ownership with contempt as a case of scrub and a master who lacked the energy and thrift to improve his stock, but such a view would be quite unjust. The purebred hog of today would have been as glaring a misfit on the frontier as the razorback would be in a show pen at the International. The razorback was a veteran ranger of forest and swamp. He knew nothing of fat cornecribs, balanced rations and fine pens. His body was seasoned by exposure against Summer heat and Winter frost. His master, if he were laid claim to at all, was master only in a mildly nominal sense. In storm and drought and flood he was left to root out his own destiny. The reptiles and carnivora of the forest menaced our fearless Berserker, but he shunned none of them. One night around the fire grandfather talked.

"I have seen," said he, "the razorback in all stages of civilization, in dense canebrakes, as fierce and untamed as the savage peccaries of South America and also as scavengers on the outskirts of frontier hamlets. One day I saw on the back steps of a house a large cat lying comfortably asleep. A hungry razorback came sauntering along. The back gate was open as he came abreast of it and 10 feet away lay the cat. With a rush the hog seized the sleeping animal, planted its sharp hoof upon it and with crunching of bone tore its body asunder. A few seconds more and the cat had disappeared, leaving not even a scrap of fur behind it. Early one morning while breakfasting with a pioneer, the harsh grunting barks of a drove of razorbacks drew us from the table. Following the sound through the woods, we found the hogs collected around the upturned roots of a large tree where a sow had been sheltering her litter of pigs. On the top of the roots, six or eight feet from the ground, stood a wolf, treed while trying to carry off a pig and not daring to jump down into that mass of frothing jaws and clashing tushes. Suddenly with fierce grunts, an old sow was seen coming up with lightning speed. Comprehending the situation, without a pause she rushes at the roots and her momentum carried her high enough to seize the wolf by the foot. In a moment he was dragged down, covered with the raging drove, torn to shreds and eaten bodily up."

A note of alarm from a razorback was always sufficient to call to its assistance everyone of its tribe within hearing, and woe betake the intruder if there were no means of escape. Not only did the razorback flourish without care, but it did an invaluable service in ridding the forests and swamps of snakes, poisonous and otherwise. Hogs are immune to snake venom, and they regard the reptile as a tidbit. Therefore there was enmity between the razorback and snake.

"One day," continued grandfather, "our camp cook set out a pot of mush to cool. An inquisitive razorback came along and thrust his long snout into it. In some way the vessel became fastened to the hog's head and off it ran squealing with pain from the hot mush, while hard behind panted the cook intent on saving his precious kitchen utensil that he could not afford to lose." It requires indeed no epicure to distinguish the ham of a razorback from that of a well-cured Tamworth, but nevertheless as the frontiersman annually replenished his rude smokehouse with the flesh of the hardy porcine ranger of the forest, his keen appetite found a satisfying relish in its nutriment and a strength to subdue the wilderness and prepare the way for the advent of the aristocratic purebred of today.

Cape Girardeau Co., Mo.

Eastern Beef Making.

THE Troy Times prints a statement from George Hills, a farmer in Rensselaer Co., N. Y., who has been experimenting at beef making. We would like to know where Mr. Hills sells his live cattle?

"Many of my neighbors have gone in for dairying. Selling milk brings a weekly income, but I am afraid most of the money goes for feed and labor, and in this section, where competent farm help is scarce, dairying is not as attractive as it looks. Cows must be attended to twice a day every day in the year, and there is never any let-up in the work. Raising beef is not so confining. Raising beef requires no large amount of money. At the age of six months the calf is weaned and then turned out. The first Winter the calf is fed a small quantity of meal once a day and the second Winter double the quantity of meal. The calf eats roughage grass in Summer and hay and other coarse fodder in Winter. The dairy cow has to be constantly fed on grain, but the beef cattle needs no such expensive food.

"I find that raising beef is as profitable as anything the New York State farmer can go into. Certainly land in New York is not as high-priced as Western land, and that should be considered in counting the cost. Counting my own work, the interest on the money invested and the saving in hired help and in feed bills, I believe New York State farmers will find raising beef is a business proposition and a good one. My neighbor, 'Case' Cottrell, told me he is going in for beef."

"WHY do you get the pretty girls jobs first? Is that fair?" "Best for all concerned," declared the head of the school of stenography. "The pretty girl soon marries her employer, and then there's a permanent job for one of the plainer young ladies."—Kansas City Journal.

DAIRY CATTLE

Purebred Registered
HOLSTEIN CATTLE

Six years' study of dairy operations on over twenty farms in three different parts of Minnesota, showed Prof. Cooper of the state experiment station that dairying is most profitable in the "Holstein section" of the state.

In 1905, the average profit per cow was $10.10. In 1909, it was $38.45 per cow. Increase was due to improved herds, purebred registered Holsteins having been substituted for grades.

When dairying is put on a systematic basis, the Holstein cow comes to the front. For facts and figures

Day after Day, Year after Year,
PRODUCTION COUNTS
It is not what a cow can produce in 7, 14, or 30 days, even in a year that determines her value to the farmer. It is what she can do in a lifetime.
Brown Swiss Cows rank high in average production and are regular and persistent breeders and producers. Year in, year out, they make good records and raise good calves without any coaxing or pampering. If interested, we will send you an illustrated booklet.
The Brown Swiss Cattle Association
IRA INMAN, Secretary BELOIT, WISCONSIN

The Henyard.

THE MOLTING HEN.

I HAVE heard a good deal about throwing hens into a molt lately. Is it a wise thing to do, and how is it done? Does it have any tendency to weaken the hen, thereby lessening the number of eggs? M. C.
Portchester, N. Y.

The molting period is the most critical time in a hen's life, as this time she replaces all her feathers and practically makes over her entire system. This is a great drain on her vitality. The molting period normally comes after a season of productiveness. Two factors have to be considered with the molting hen, inheritance and management. Under natural conditions, early or late molting is an inherited trait. While the inherited tendency of a hen is to molt at about the same time each year, the environment and management can change the time of molting, such as forcing an early molt. At present I do not know of any means of retarding the molt. Forcing an early molt is usually done as follows: Gradually reduce the ration fed, so that at the end of 10 days the hen is getting only one-third of her regular ration. Keep her on this low ration for about a week or 10 days. For the next week, gradually increase the ration so that by the end of the week the hen will be getting all she will eat. The object of starving is to stop egg production, and loosen the old feathers; then the heavy feeding of a rich ration gives the hen sufficient nourishment to start new feathers, etc.

Let us now consider the normal or natural molt before taking up the advantages and disadvantages of forcing an early molt. A hen that naturally starts to molt early shows by so doing that she has not the high constitutional vigor that is absolutely necessary to make a high yearly egg production. Some hens will lay a few eggs in Summer during a partial molt, but it is very rare for a hen to lay during the general or complete molt. The earlier a hen starts to molt the longer it will take her to complete the molt, especially if the Summer is very hot.

Over-feeding of a rich forcing ration will very often cause a partial molt in hens; also if pullets are put on a too forcing ration, when they are first put into the laying house; it will, in many cases, cause a partial molt.

As many people prefer a hen that naturally starts to molt early, let us take a pullet that begins to lay in October, 1912, and starts molting in June or July, 1913. She has been laying eight or nine months. It takes the average Leghorn hen from 80 to 104 days to complete the natural molt, and then she does not start laying for some time after the molt is completed. It will be late in the month of September or October before she can be expected to resume laying. All experienced poultrymen know that Leghorn hens (yearlings or two years old), do not lay enough eggs during November and December to pay for food consumed and labor. So you see the early molting hen is carried at a loss for five or six months. An early molting hen should never be used as a breeder.

A hen that molts late shows that she has the high constitutional vigor necessary to make a high yearly egg production. A very late molting hen is in most cases a high producer. For example again: A pullet that starts laying October, 1912, and does not begin molting before the middle of September or October, 1913, has been laying 11 or 12 months. Hens starting to molt in September or October complete their molt in much less time. The cooler weather seems to shorten the molting period. The hen does not have to resist the Summer heat and grow new feathers at the same time. These late molting hens will in most cases complete their molt in December, some even earlier. In January there will be very little difference in egg production, either way, between the late and early molting hens. After January I have found the late molting hen always out-laid the early molting one. You see the late molting hens are carried a much shorter time at a loss, their period of productiveness is much longer, their yearly egg production is higher, and most important of all, the profit per hen is greater. For breeding use only late molting hens, and cockerels or cocks from late molting hens.

Forcing an early molt has many advocates; they claim that by forcing a naturally late molting hen into a general molt early, she will complete her molt early in the Fall and lay at the time eggs bring the highest price—November and December. It is true that a late molting hen that is forced to molt early will lay a very few more eggs during these months, but the net profits from the large number of eggs laid during the Summer, by the late molting hen, will be much greater than the profits, if any, from the few high-priced eggs laid by the forced molting hen. If a late molting hen is starved, and forced to molt early one year, the next year (if she is not forced to molt early) she will molt at her natural time.

Anything as drastic as forcing an early molt, and going against nature, must have some effect on the hen's vitality, for hens that are forced to molt lost more weight during the first part of the molt than hens that molt naturally. Also the forced molting hens lay fewer eggs during the year than the naturally late molting. From my experience the natural late molting Leghorn hen pays the largest net profits, and it does not pay to force an early molt with Leghorns.

EDWARD S. PARSONS.

THE MISSOURI EGG-LAYING CONTEST.

Mr. T. E. Quisenberry, director of the egg-laying contest at Mountain Grove, Mo., tells how Tom Barron undertook to select the poor layers in several of the contest pens:

"We looked up the records of each case and found that the hens which he claimed were of poor type and poor producers were among the poorest layers according to the records. In one case we had a White Orpington hen that had not laid an egg, and she was in a pen with 11 other hens. The hens were driven before him, and at first glance he picked out this hen; the hen was in good health and to the ordinary observer looked as good as any of the flock. He pointed out the good and bad layers in other flocks and the trapnest records verified his statements."

Mr. Quisenberry states that Mr. Barron did this "*without handling a single hen.*" The type of hen which Mr. Barron thinks indicates the best layers, is "a bird that stands high in front, the body sloping toward the rear. They usually have large combs and high tails, and a prominent large bright eye." Upon handling the birds he finds that the best layers have thin, straight, pelvic bones, wide apart, and that there is quite a distance between the pelvic bones and the rear point of the breast bone or keel. This indicates capacity, and lots of room for the egg organs. He likes the wedge shape, rather narrow in front but wide at the rear, and wide between the legs. Mr. Barron makes a strong point of having all the males bred from high producing hens, also of breeding from unrelated birds. His breeding pens contain two cockerels—own brothers—one of which is confined in ontside coop, and birds changed about every five days. Mr. Barron thinks the eggs are more fertile and the chicks stronger as the result of this five-day rest which the cockerel has.

As broodiness lowers the egg record Mr. Barron tried to eliminate this as much as possible, breeding preferably from those which never show broodiness. He thinks that the earliest laying pullets are likely to make the best layers. He thinks we could increase the egg production by feeding more wet mashes. A hen will eat more of a wet mash, and she has to be a big eater if she is to lay many eggs.

In the contest for the month of July a Missouri pen of White Leghorns wins the silver cup with a record of 239 eggs. (In the contest at Storrs the English pen laid 250 eggs.) All 10 of the highest pens for this month are White Leghorns. The 10 leading pens since the contest commenced are as follows:

	Eggs
White Leghorns, England	1,772
S. C. Red, Missouri	1,523
White Wyandottes, Pennsylvania	1,439
White Leghorns, Pennsylvania	1,427
White Wyandottes, England	1,356
Barred Rocks, Ohio	1,342
Barred Rocks, Illinois	1,341
White Rocks, Arkansas	1,338
Black Minorcas, Missouri	1,331
Black Minorcas, Missouri	1,317

This shows the English White Leghorns 249 eggs ahead of any other pen. The highest hens in this part of the contest are five of the English birds, with record of from 178 to 194 eggs; with three months yet to add to those figures. Mr. Quisenberry states that entries enough have been received for the next contest commencing November 1, practically to fill all the pens. Only a few are left to be filled. GEO. A. COSGROVE.

Pullets or Hens.

I READ in your book "The Business Hen," that one should not buy eggs for hatching without a guarantee from the seller that they were from old hens and not from pullets. I would like to ask where is the dividing line between pullets and old hens? Are eggs from pullets hatched May and June this year suitable for incubating next Spring? J. C. C.
Little Hocking, O.

The eggs from pullets in their first laying year would be considered "pullets' eggs"; pullets becoming hens after one year of age. The age of hens more than a year old are usually larger than those from pullets, and produce larger chicks; old hens have also demonstrated their longevity, as pullets have not. Aside from these reasons I can see no reason why the eggs from well developed and mature pullets should not be used for hatching and it is my practice to use them. April, May, and perhaps early June pullets can safely be used in breeding pens next year providing that their care and feeding has been such as to bring them well toward maturity and the individuals are of good size and abundant vigor. The use of immature pullets in the breeding pen could only result in deterioration in the flocks. I have some mid-May hatched pullets from which I expect to hatch every chick possible next Spring; these pullets are being cared for in such a way, however, as to fit them for their maternal duties when these are required of them. M. B. D.

Get the Facts About
No. 9 Empire
Open Hearth Steel Fence
Our book shows you why No. 9 Empire and Empire, Jr., made of Open Hearth Steel, great big wires, galvanized as a wire fence *should be* galvanized, outlast any soft Bessemer steel fence made. Illustrates big wires—the strong Empire knot that holds good as long as the fence. The rust proof, rot proof, hog tight fence. Write for book and get money saving fence facts.
BOND STEEL POST COMPANY
23 Maumee Street Adrian, Michigan

"Pittsburgh Perfect" Fences are now made of
GENUINE
DOUBLE GALVANIZED WIRE
IMPORTANT ANNOUNCEMENT!
THE LATEST and greatest of all improvements we have ever made on the original "Pittsburgh Perfect" Fencing, is our new and exclusive method of DOUBLE GALVANIZING FENCE WIRE, which *adds years of life to "Pittsburgh Perfect" Fences* over any fence you have been able to obtain before now.
This is *genuine double galvanizing*—the secret of which has been sought after for years by the Government Investigators, Metallurgists and Manufacturers the country over.
But mark this—our method of *double galvanizing* is possible only because of the high quality of the special-formula Open Hearth wire we use. It is of that perfectly *uniform texture* absolutely necessary to *absorb* the galvanizing metal, and the only wire that will take the proper heat treatment and can be *actually galvanized.*
By numerous scientific tests of many kinds we have *proved,* beyond question or doubt, that our fencing is now *twice as durable* as any fencing you have been able to obtain heretofore.
SOLD BY DEALERS EVERYWHERE UNDER THIS
UNCONDITIONAL GUARANTEE
Our Dealers are authorized to ABSOLUTELY GUARANTEE "PITTSBURGH PERFECT" FENCING to be in every respect exactly as we represent it. Back of this guarantee stands the Pittsburgh Steel Company, owning and operating the largest independent plants in the world manufacturing Fencing, Nails and Wire.
YOU CAN'T LOSE when you buy "Pittsburgh Perfect" Fence on the strength of this guarantee. Our new catalogue, just off the press, is full of fence information; you need it, whether you want to buy fence now, or will later on.

Carbolic Acid for Abortion.

I NOTICE on page 1039 the inquiry of E. H., Maryland, as to abortion, and such calls for help are frequent. Perhaps the experience of myself and neighbors may be useful to our brother dairymen. In Spring of 1897, most of my cattle were killed because of tuberculosis, and in filling up the stables again a cow was purchased from a herd where abortion had prevailed. She aborted, and the next season half the herd aborted, and there was plenty of trouble. My next neighbor's bull became infected, and the next year he also had a lot of trouble. He used no remedy at first, and I spent many dollars for advertised remedies, but our results were alike—the trouble continued.

A stranger moved to our town who told us of the carbolic acid treatment, which, he said, had been used with complete success in his brother's herd in New Hampshire. We gave it a trial, and were well satisfied with the results. Later, others used it, and we were conquering the disease, years before I ever read of this treatment. The usual formula for abortion is "Isolation, disinfection, veterinary," which things we have tried and found to be expensive, useless and entirely unnecessary.

Get carbolic acid in crystal form. Dissolve by putting the bottle in hot water, use 10 parts of water to one of the liquid acid, or about a pint of water to each ounce bottle of crystals. Shake well before using. Dose, small tablespoonful once a day to all cows carrying calf, also the bull. Continue two or three weeks; then skip same length of time, and so on till near calving time. I have claimed that no treatment of bull was necessary but it was insisted on by the one who first told me of the remedy. In my herd, no cow was bred till six months after aborting, and I had little trouble with farrow cows, though without any treatment, many cows fail to breed.

Dump the spoonful of medicine in a feed of meal of any kind. Just a little bran, if no grain is being fed, and though the smell of carbolic acid is to most people quite disagreeable, I never knew a cow to refuse it. In some herds it has been found necessary to treat all heifers carrying first calf, or abortions would now and then occur, even two or three years after all old cows were breeding regularly. This remedy will not stop the disease in a case far advanced, but so far as I know is a sure preventive if used in season. When a cow has once aborted ten chances to one she will fail to breed or abort again. With this treatment she will not abort again and in a majority of cases will breed regularly.

Vermont. D. A. KNEELAND.

Land Plaster for Heaves.

I FEEL it a duty to help one in trouble when I can, as I have been a practicing veterinarian for nearly 30 years and have had many remedies for horses, but I somewhere saw in some paper or magazine that a heaping tablespoonful of common land plaster put in the feed and well mixed with it each night for four or five nights, or till relieved and then omitted for a few nights, then repeated as necessary, would relieve horses so troubled. I have used it in a number of exceedingly bad cases with uniformly good results, making the animals quite comfortable and useful in their work. It is based, I believe, on the fact that asthma and heaves are due to indigestion and the plaster or gypsum acts as a disinfectant to the alimentary tract. It is so simple and cheap and so easily given, and there have been no restrictions or change in manner of feeding, which is an item. Of course the evening feed would have to be such that the plaster could be well mixed with it. I have seen very bad cases so relieved that they were scarcely perceptible even to an experienced eye. Tell F. T. S., on page 1038, to try it and report the results, or anyone else who has a horse so affected. VETERINARIAN.

R. N.-Y.—This comes from a friend who has treated horses for many years. Land plaster or gypsum or sulphate of lime is often used on the soil or in stables and manure piles. Plaster of Paris is the land plaster calcined or heated so as to remove its water. *Do not use plaster of Paris* for this remedy. When this is mixed with water it "sets" or forms a hard mass. Small quantities mixed with the feed would not cause much trouble unless the stomach or bowels contained hard substances like stones or nails. The plaster of Paris might collect on these and make trouble. Veterinarians sometimes find such "stones" in the stomach of horses. The use of land plaster or gypsum as advised above would not cause trouble. The doses should be given only long enough to make the horse comfortable and then discontinued until he shows trouble again.

Malt Sprouts for Pigs.

WOULD malt sprouts be good to feed Spring pigs, and how much? Would they be good to feed a brood sow before and after she has pigs? A. J. L.
Clyde, N. Y.

Malt sprouts are not particularly useful for feeding Spring pigs, since they are rather bulky, and not concentrated enough for pigs. Furthermore, they are not easily digested by the young pigs, and animals fed on this material would not evidence thrift or great vigor. A better mixture would be made up of 100 pounds of red dog flour and 100 pounds ground oats, to which ten pounds of digester tankage has been added. A very good ration for brood sows nursing pigs would be as follows: 100 pounds of ear corn, 15 pounds of wheat bran, 10 pounds of digester tankage, five pounds of oil meal, two pounds of bone meal. Just previous to farrowing I would suggest using the same ingredients, but fed to the animal in smaller quantities; that is by means of using additional water, or feeding a thin slop. The consistency of this mixture as fed to the sow nursing pigs three weeks old, should be about the thickness of good buttermilk. The addition of some Alfalfa leaves to the ration at farrowing time increases its bulk and has given good results.

The brood sow should be fed all that she would clean up with a relish, and our experience shows that they can be fed liberally after the pigs are three or four weeks old; up until this date and age of the pigs the amount should be governed by their appetites, and also keeping their digestive systems free from irregularities or disorders. F. C. MINKLER.

Maine Law on Straying Cattle.

I HAVE a neighbor whose cattle have run at large more or less for the last eight years, and particularly so for the last two years and have caused a great deal of trouble in our neighborhood. Is there any law for putting them in the pound? M. A. D.

The laws in Maine require every owner of live stock of any kind to keep them on his own land or under proper subjection. No one has a right to allow his animals to annoy or injure his neighbors, and every owner is liable for all damage done by said animals, either in an action for trespass or in a lien on the animals. I should judge that in this case the trouble comes from the animals being allowed to run at large rather than that they get out of the enclosure. That being the case, the aggrieved party has as good right to recompense as though they strayed from a pasture.

No man is obliged to enclose his fields, or to build road fences. The highways are for legitimate use and not for the pasturage of any live stock. If, perchance, a drove of cattle or other animals do damage to crops, the owners thereof would not be liable if it could be shown that they used due diligence in trying to restrain them, otherwise they would have to pay all damages, as they would if the animals had strayed. M. A. D. should see to it that his line fences are in good repair and that they conform to the State law relating to division fences, which is as follows:

"All fences four feet high and in good repair, consisting of rails, timber, boards, stone walls, iron or wire; and brooks, rivers, ponds, creeks, ditches and hedges,

Removing Garlic Flavor from Milk.

THE disagreeable flavor and odor left in milk when cows eat wild onion or garlic within four hours before milking, can be removed by blowing filtered and washed air through the milk for 30 to 60 minutes, according to the strength of the garlic flavor. This conclusion, which is published in U. S. Department of Agriculture Farmers' Bulletin 608, shortly to be issued, is the result of a series of experiments made by the Dairy Division on methods of removing the garlic flavor which greatly lessens the commercial value of milk and cream. To remove the garlic flavor successfully, however, the milk must be raised to a temperature of 145 deg. and a method devised to keep the milk from foaming when the air is blown through it. To do this, the investigators constructed a special apparatus. The temperature of the milk is very important, as air blown into cold milk does not remove the garlic flavor, and also has a tendency to churn the fat. This may make a thin layer of butterfat form on the surface of the milk when bottled. It was found that in raising the milk to 145 deg., which was the best temperature for the removal of the flavor, it was best to stir the milk by some mechanical means. The stirring, however, should not be too violent or it may churn the fat.

Purchase of Cow.

I BOUGHT a Guernsey cow in October from a man who distinctly told me she was in calf and wrote me that she was bred in July and due in April. I told him I did not care for the milk last Winter but did want it in the Spring, and he said that was just the cow for me and even made me an offer for the calf when born. With this understanding I bought the cow only to find later that she was not with calf at all. When I notified the seller of this he wrote he thought I must be mistaken, that he would not have sold her had he thought she was not with calf, but that as several months had passed he did not feel responsible, and that other cattle men assured him he was not responsible. I feel that the cow was not as represented, and that the seller should take her back and refund my money or make it right in some way. K. W. M.
Connecticut.

From the facts stated in your letter it would seem to be indi ated pretty clearly that the seller warranted the cow to be with calf, and that this was not merely an expression of his inion, and the breach of this warranty gave you the right to return the cow immediately on your discovery that it was not with calf. Inasmuch as you have held it from April until this late day you have probably waived the right to return the cow, but you still have an action for damages against the seller and should recover the difference in value between the cow if she had been with calf and as she is, without. M. D.

Millet Hay.

I HAVE been informed by farmers that if German millet is allowed to go into heads to make dried fodder for stock that it is not as good as when cut before heading. Is this true? S. H.
Pierce, Pa.

Millet hay made after the plant has formed its seed is all right for cattle, but should not be fed to horses. Such hay has a bad effect upon the horse, giving trouble with kidneys, and also trouble with the joints and legs. A number of cases are reported where horses fed on this hay have died. The fodder is all right for cows, but the wise plan will be not to feed millet hay to horses at all.

STIRRING WATER-COOLED MILK.—The Department of Agriculture has issued a note on this subject regarding their experiments in cooling milk. In experiments made with cans where the top of the milk was above the water level, it was found that the milk above that level remains from five to six degrees warmer than the portion below the level. Bacteria consequently will develop at a higher rate in the top of the milk, and when later the milk is mixed, the souring of the whole canful will be hastened both by reducing the temperature of the whole and also by the increased number of bacteria in the warmer portion. In the experiments all the cans were cooled by the same method. The milk in some of the cans was stirred every 15 minutes while that in others was not. The water in the cooling tank was 62.6 deg. Fahr. The milk that was stirred cooled from nearly 90 deg. to slightly above 60 deg. in three hours. The unstirred milk did not get down to a similar temperature for four hours and 15 minutes. Meanwhile, in the unstirred milk all the milk above the water level in the running water was five to six degrees warmer. The comparatively rapid decrease in temperature when the milk was thoroughly stirred at intervals of fifteen minutes demonstrates the advantage of agitating the milk while cooling.

Leaking Teats; Lame Calf.

FOR the benefit of C. E. S. of New Jersey, who asks for remedy for leaking teat, I use a quick blister just at the opening of teat, when dry is best. The healing contracts. Let entirely alone after blister is applied. We never used it while milking. We have tried collodion and alum water, no luck with either; the blister never fails us. 2. We have a bull calf six months old, stiff and lame in his joints; lies down quite a lot. I think he was overfed on oil meal when about three months old. What can we do for him? C. H.
New York.

1. We advised use of flexible collodion, alum solutions, etc., while a cow was giving milk and leaking from her teats. Blistering may be all right when a cow is dry, but it cannot be done when the cow is giving milk. In our experience, too, the leaking may not occur when a cow has her next calf. We have no objection, however, to use of a mild blister on a dry cow. 2. Physic the calf with castor oil; then give him 10 grains of salol twice daily and feed light, laxative feed. Let him have some exercise on grass. A. S. A.

WORKING OVER STALE BUTTER.

AS a storekeeper I take hutter in trade —some of it very poor in quality. Other storekeepers do the same, and it would be possihle to get hold of large quantities of this poor stuff. Would it pay to work this butter over and ship it after cleaning it up? S. B. J.

I doubt whether it is a practical proposition for the people who run small grocery stores in farming districts to rework country butter and get it in such shape that they could sell it for enough more when it came to market to pay them for the expense incurred. It would he necessary to have a combined churn and worker, which would call for a considerahle outlay at the start. The man who would do the work should also have a good understanding of hutter making. If the storekeeper himself has had no experience in this line of work, I question whether he would he able to improve the product very much. If one has the equipment and experience in hutter-making to warrant the undertaking, the general process would be as follows:

Fill the comhined churn and worker about half full of water at 55 or 60 degrees F., depending on the solidity and general character of the butter. Put the butter to be reworked into the churn and revolve the churn several times with the workers in gear so that the hutter may be well washed. Draw off the water and again fill the churn approximately half full of water. Repeat this process three or four times until any bad odors have been washed away. This washing will remove most of the salt from the butter and likewise a large amount of the color. In order to restore the salt content and color to the butter the rewashed hutter should be salted heavily enough so that the completed product will have at least 3 per cent. of salt. The butter should he salted rather heavily in order to ohscure any lingering traces of bad flavors. No more salt should he employed than will dissolve. The coloring should he thoroughly mixed with the salt before the latter is added. When the colored salt has been thoroughly distributed over the hutter the color also will he uniform throughout. A. A. BORLAND,

Professor of Dairy Husbandry.
Vermont College.

A Concrete Block Silo.

IN regard to my silo shown, at Fig. 484, it cost all told $430. In places where good gravel can be obtained easily this same silo can be made much less; two good men can make 100 blocks a day and the mold to make them in cost $15. My blocks are 8x15 and there are 1200 in my silo. The silo is girded with ⅝-inch steel rods, every three feet, laid inside the hlocks in a groove made on purpose. I have the best material I could get; clear pine doors. My silo is very heavily plastered inside with cement and a little lime, just enough to make it stick well. My silage came out perfectly clean up to the very wall. There is no douht that these silos are an ornament to any farm. We usually cut our corn when the lower leaves hecome dead. We cut and hind corn and as soon as wilted begin to fill silo hy cutting and hlowing it in with an ordinary corn hlower, keeping corn as it comes into silo slightly higher in center and tread down well around the sides. If you have good rich silage, the kind that makes the cows laugh, raise corn that ears heavily; it saves buying extra amount of grains and cows will actually shell out the milk to surprise you. With good sweet silage you can make milk just as cheap in Winter as in Summer, and get double the price for it.

Lewis Co., N. Y. WM. S. GOUTREMONT.

Live Stock on Grain Stubble.

TOM BARRON, the English poultryman, gave us all an idea of "intensive meat production" with his experience. On 20 acres Mr. Barron keeps 7,000 head of poultry and 10 cows and "has some hay to sell!" It is necessary to utilize "every grain and every bug" in order to reach such results. We do not, in this country, half begin to utilize our farm resources. For example, the stubble of grain fields. Such fields are usually left to grow up to clover and weeds, yet here is what English "Farm and Home" advises:

It is nowadays neither advisable nor convenient to send our pigs out as a herd for the purpose of saving the fallen corn under present conditions, for the energy wasted would probably be almost as costly as the food which was saved. There is, however, no reason why a large flock of turkeys should not be kept on a corn farm, and fed during the harvest month in the stuhhles, as, although the same principle applies, it does so in quite a minor degree. While the turkey is far less excitable and determined a feeder, not expending his energy so freely, he takes much longer to matnre, and therefore can be trusted to waste very little, and not to diminish his growth by this means. Although I hold the opinion that a wellhred turkey will pay as well as a sheep, I am conscious of the value of the flock on the stubbles, consuming, as they do, seed-hearing weeds, and, while finding food for themselves, maintaining the cleanly condition of the land. If we omit thistles, nettles, and docks, there are few weeds which the sheep will refuse, and as many species produce hundreds, and some thousands, of seeds on one plant, it is not difficult to appreciate the economy of the practice.

Live Stock on Fruit Farm.

"LIVE stock feeding in addition to our fruit growing keeps our force busy nearly the entire year,' says W. W. Farnsworth of Lucas County, Ohio. "We allow hogs to run with our steers, and the manure pays for lahor, and we make some profit. The profit lies in supplanting the steers with hogs. When we no longer can feed at a profit, we will use cover crops and commercial fertilizers. We generally feed about 60 steers, and intend to feed a larger number this year. Our ration is made up of silage, corn and cotton seed. We purchase most of our feed, and last year we bought considerahle clover hay. When clover hay is too high we feed straw and fodder and increase the cottonseed to balance the ration. It is our aim to pay original cost, pay interest, risk, feed and labor, and have the manure net. A year ago, owing to having less hogs we did not do that well, and the year previous we did hetter. We allow about two-thirds as many hogs run with the steers as there are steers. More hogs may he kept, where corn is fed in shock, than when ground. We give the hogs tankage and skim-milk, and we pay 10 and 15 cents the hundred for skim-milk. We sometimes raise pigs and at times huy our hogs, in any event, we like to have them weigh 75 or 80 pounds, when we put them with the steers. We try to secure 350 pounds gain on the steers in six months. Last year we bought a little early and paid 7½ cents, and sold for 8½ cents. In huying at times we visit the Chicago market, and sometimes of a local buyer, and we sell to a local buyer when our stock is ready to market. Our feeding is done in sheds and small yard, and haul to orchards and fields as fast as the manure accumulates. The profit largely lies in the hogs, for they get most of their feed from the droppings." W. J.

AILING ANIMALS.

Wart on Goat.

I HAVE a valuable Angora buck that has a bloody wart about one inch across on top of neck near horns. I have been using peroxide on it, which keeps it down hut does not cure it. There is no veterinary near me. Can you give me a cure I can use myself? C. E. D'G.

Notch, Mo.

Peroxide of hydrogen is practically useless in such cases. It would be best to cut the wart out and then stop the bleeding by application of a hot iron, or Monsel's solution or powder. If you do not care to operate paint the wart twice a week with dilute nitric acid, after smearing lard around the part. A. S. A.

Cat With Worms.

We have a cat that has worms; he is very thin. What remedy is advised?

Delaware. A. N. J.

Two or three grains of santonin may be given, according to size of cat, after starving the animal for 12 hours. Give a dose of castor oil three hours after administering santonin. Worm medicine for dogs and cats may be bought in any drug store, ready for use. A. S. A.

Navicular Disease.

COULD you tell me about navicular disease in horses? What is the cause of it, and can anything be done except unnerving? I had a horse unnerved for this trouble a month ago. He is free from lameness, but people tell me his foot will he dropping off before long. Will it come off if properly cared for, kept growing and free from disease or bruises? The horse is 18 years old, weighs 1,050, travels with high hackney action. If his foot comes off, will it grow again, and how long would it take before horse could he used again? R. A. D.

Massachusetts.

Any veterinarian capable of properly unnerving a horse for navicular disease should be trusted to give the information asked for in this letter. Sloughing of the foot is comparatively rare, following the "low" operation. In an 18-year-old horse it would necessitate destruction of the animal. If the operation was properly done, and you allowed the veterinarian to care for the horse sloughing will not be likely to occur. A. S. A.

Goitre.

I HAVE three goat kids, horn in May, one huck and two does. Ahout three weeks ago the buck had some hunches come on his throat—each side of the throat just hack of the jaws. He did not seem sick, ate and played as the rest, so I let it go, thinking he had caught cold perhaps and would soon be well again. Since then the bunches have grown, until now his neck seems thick all the way down. The bunches are separated and one is larger than the other. Now the other kids seem to have bunches starting on their necks. They do not act sick, and are fat and in good health otherwise. Can you tell me what is the trouble, and what I shall do to cure it? L. B. C.

New York.

The thyroid glands are enlarged, constituting "goitre," which indicates constitutional weakness, the tendency to which is hereditary. If the kids are well nourished and allowed to live a natural life, without pampering, they may outgrow the trouhle. To hasten recovery clip the hair from the swellings and paint them with tincture of iodine every other day until the skin becomes irritated; then stop the treatment until the skin recovers, when it may be repeated, if seen to be necessary. If the enlargement softens from formation of pus it will have to be opened. A. S. A.

Indigestion.

I HAVE a colt foaled June, 1911, which was in fine condition and apparently normal till ahout January or Fehruary, 1913, when the hair began to drop from the face and spots on the body. She also seemed to crave more food, but rather lost than gained in flesh. I treated for lice. She was turned out to pasture early, some distance from home, brought her hack in July; hair was gone from mane and tail, body looked about the same, hair off and small spots elsewhere. I consulted veterinarian of good reputation and he said skin disease, gave medicine and wash; hair started a little on tail. She was boarded out from December 1 till middle of May; general appearance improved; body quite well covered, mane about as good as her mother's (not long) but only the lower half of the tail has hairs, averaging perhaps five inches long. What do you advise? M. I. K.

New York.

Indigestion explains the entire trouble and still is present. Feed on whole oats and one-ninth part of wheat hran, along with dry hay. Do not feed grass. Give the drinking water hefore feeding. Work or exercise the horse every day. Once daily wash all hairless parts with plain cold water. Give half an ounce of Fowler's solution of arsenic night and morning. Gradually discontinue the medicine when the colt is in good condition, taking at least ten days to the work. A. S. A.

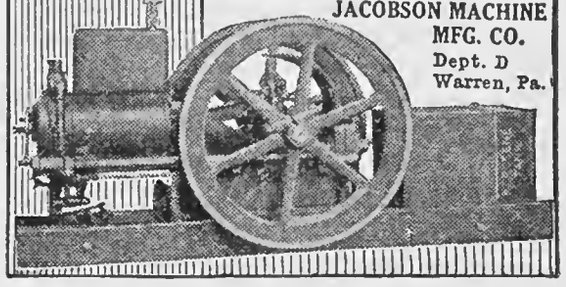
"THE woman threw herself into the river," read the teacher. "Her husband rushed to the bank. Now, tell me why her husband rushed to the bank?" "To get the insurance money," yelled the class.—Cincinnati Enquirer.

Jacobson Gasoline—Kerosene Engines

Send for Free Booklet

One of our newest engines operates on gasoline *or* kerosene. That's a big advantage. For every farm job—runs the pump, separator, sheller, feed grinder, wood saw, hay baler, washing machine, etc. Our portable engines are approved and labeled by the Underwriters. Easily moved to where work is—stand firm as a rock, without fastening. Easy and sure starting. We manufacture 1 to 60 H. P. Material and workmanship the best buyable. Write us today.

JACOBSON MACHINE MFG. CO. Dept. D Warren, Pa.



GRAIN and FERTILIZER DRILL

The YORK FORCE FEED DRILL combines lightness with strength. Most complete drill made. No complex gearing to get out of order. Boxes are close to ground. Fully Guaranteed

Easily regulates quantity of seed or fertilizer, and sows with regularity.

ROOFING—85 CENTS ROLL—108 Feet. Nails, Cement. RUBBER ROOFING CO., 5 Cortlandt St., New York

AMERICAN STEEL FENCE POST

Made by American Steel & Wire Company

High-class steel, heavily coated with zinc. Strong enough to hold up any wire fence and furnish all necessary resistance. End and corner posts so strong that they will maintain any wire fence made.

Cheaper than Wood and More Durable

Adapted to all conditions and absolutely satisfactory, no matter how heavy the fence nor how hard the usage after the fence is erected. Give better service than wood post, and you get the benefit of every post in the fence from year to year, while wood posts burn, rot and decay from the start. Have been in service since 1898, in every section of the United States, and the oldest posts now as good as when set. Adapted to all fences. Increases the life of a fence. A wire fence on wooden posts is like building a brick house on a wood foundation. For sale by dealers everywhere. Big picture catalog FREE.

Save $1 to $2.50 PER TON on Lime

Ground limestone at the quarry costs from $1 to $1.50 per ton. Freight and hauling makes it cost from $1.50 to $3 delivered on your farm. If you have lime rock available, it's like throwing away money to buy limestone at these prices! For, with a JEFFREY LIME-PULVER on your farm, after quarrying the rock, you can grind it for 50c per ton. You can save from $1 to $2.50 per ton. In a short time the machine has paid for itself. Your farm is free from rock—richer—more productive. You can grow the clover and alfalfa that before refused to thrive. You have lime in a form that's better than burnt lime.

Grinds 2 to 3 Tons Per Hour

The Jeffrey Lime-Pulver will take the big rocks—any size up to 4 inches thick and 11 inches long—and grind them to a powder at the rate of from 2 to 3 tons per hour. It's both a crusher and a pulverizer. No need to have two machines—one to crush and one to pulverize. The Lime-Pulver takes the big rocks and grinds them to a fineness that will go through your spreader without the slightest trouble—no clinkers to get in and break it up. You can grind the rock coarser if you desire. But fine grinding is of utmost importance.

Grinds Rock for Road Work, Corn Tobacco Stems, Bone, Etc.

The Lime-Pulver is a dual purpose machine. It will grind rock for road work—2 to 3 tons per hour. Grinds corn on the cob, tobacco stems and bone. Made in the famous Jeffrey shops, of materials almost wear-proof. Ball-bearing pulverizer—pulverizing hammers of Manganese steel. Mounted on wheels and as easily moved as a wagon. Sold on a money-back guarantee. If you have lime rock available and do not own a Lime-Pulver, you pay for it over and over again without ever really owning one, if you have lime rock, you can make big profits selling ground limestone to neighbors. Write today for full particulars, price and our free booklet on Lime.

The Jeffrey Lime-Pulver

The Henyard.

THE EGG-LAYING CONTEST.

THE forty-third week shows a big drop in egg production, the output for the week was 2,866, as against 3,065 the previous week—a drop of 199 eggs. Tom Barron's White Leghorns make the highest score, viz., 53. A. B. Brundage's S. C. Reds take second place, with a score of 52, and Francis F. Lincoln's White Leghorns are third, with a record of 50 for the week. W. C. Morgan's Buff Plymouth Rocks are fourth, scoring 48; two hens in this pen laid every day in the week. The average output of all the pens this week is a trifle less than 34½ eggs each. In the total score Francis F. Lincoln's White Leghorns are 16 eggs ahead of Barron's White Wyandottes, and it looks now as if the Connecticut pen would win, though Mr. Barron still thinks that Wyandottes may lay well enough in the last few weeks to more than even up the score. Storrs pen No. 42 has laid more than any other pen, their total being now 1,841; but they are not competing, being fed differently.

There are five experimental pens of White Leghorns from Storrs Agricultural Station, and it is worthy of note that pen No. 42, which has been fed sour milk ever since they were hatched, is now 327 eggs ahead of the best of its sister pens. If sour milk feeding is wholly responsible for this great gain, then it seems that dairying and poultry keeping ought to be combined. Below is the record for the week at Storrs:

	Week	Total

GEO. A. COSGROVE.

TRAINING FOR THE CONTEST.

SUPPLEMENTING my article on page 1041, let me say that the real meat or kernel came out of Barron's message to America when he told us how he has been in the habit of preparing his birds for a contest. It has long been known that in what is called the "pullet year" it is often possible to get a full 12 months of continuous work without any check from molting. In the case of non-sitters it is possible to get 12 months' work without interruption by either broodiness or molt. It is these birds that make the high records. He has been sharp enough to take advantage of this. He told us that he plans to have them all ready to lay their first egg just as soon as they reach the contest grounds.

If they seem inclined to lay before, he holds them back, as is quite possible to do by means of scanty rations, frequent removals to new quarters, etc. Then when they reach the full rations and permanent home of the contest grounds they get right to work and secure a full 12 months' work. He succeeded in doing it this year with his Wyandottes, but failed with his Leghorns.

Mr. Lincoln beat him at his own game with his Leghorns, and it looks now as though Barron cannot overcome the handicap which was placed on his Leghorns during the early days of the contest. Should Lincoln's Leghorns conclude to molt much before the close of the contest year, or Barron's Wyandottes get their second wind, we shall see a very exciting close of a very pretty contest.

When the Hope Farm man, with his scrubs, and the show bird man with his show bird type, take the same care in preparing a pen for the race which Mr. Barron and Mr. Lincoln have taken, we will find that there is not so much difference as now appears. I am frank to admit that heredity can be taken advantage of to some extent by the use of the trapnest, but it is not "the whole push" by any means. O. W. MAPES.

WYANDOTTES AS LAYERS.

I WRITE you in behalf of the White Wyandotte, which you have been hitting so hard of late. Naturally, we breeders should resent it a little. You say that that dumpling Wyandotte will not lay as many eggs as the longer-bodied birds do. Now we will take the six leading breeds in the contest, and see how they line up. First then we will average them up. First we will take the four pens of Wyandottes (not counting in Barron's) and the five leading breeds:

White Wyandottes, 4 pens	4,760
White Rocks, 4 pens	4,194
Barred Rocks	3,222
S. C. Reds, 4 pens	4,828
S. C. Leghorns, 4 pens	5,755

Out of 13 pens of S. C. Reds you find four pens to beat the dumplings, 68 eggs. Out of 33 pens of S. C. Leghorns you find four pens to beat the dumplings' 995 eggs. Now we will see what these different breeds average: W. Wyandottes, average per pen, 1,260 4-5; S. C. Leghorns, 1,127 23-33; S. C. Reds, 1,005 12-13; Barred Rocks, 1,055½; White Rocks, 969 3-7. You see the dumpling is not so far behind, and it stands a good chance of going farther ahead yet before the contest closes, so please don't hit the dumpling quite so hard yet awhile.

New Jersey. SIDNEY WEBSTER.

R. N.-Y.—But how do you know these pens are what we call "dumplings?" Most of these birds are "utility" Wyandottes and not "dumplings" at all. Some of the breeders seem to be trying to put us in the position of attacking the Wyandotte as a breed. Of course, they know better but it suits their purpose to try it. Our invariable answer is that words count for little—bring a pen of the "dumplings" right up to an egg-laying contest.

JULY RECORD AT EGG CONTEST.

THE laying record at Storrs, Conn., for the month of July, was 12,334 eggs. The largest number of eggs laid by any pen was 250, by Tom Barron's White Leghorns. The number laid by each individual in the pen is, 26-26-28-26-26-27-14-24-24-26, and three laid on the floor. P. G. Platt's White Leghorns are second with a total of 234 for the month. Pen number 42—the "sour milk" pen—is third with a score of 231; Charles Heigl's pen from Ohio are fourth, laying 228, and Geo. A. Cosgrove's pen is fifth with 227 to their credit for the month. Thos. W. Moore's pen laid 226, Chas. N. St. John's pen laid 222, Francis F. Lincoln's pen laid 221, Glenview Poultry Farm's pen laid 216, Marwood Poultry Farm 215, C. H. Savage's pen 211, N. W. Hendryx's pen 210, and four other pens laid 200 or over. All the above are White Leghorns; none of the other breeds reached 200. The greatest number laid by any other breed was 192, by Tom Barron's pen of White Wyandottes. H. W. Collingwood's "scrubs" laid 173, beating 49 out of the 82 pens. They laid more eggs in the month than any pen of Barred Rocks, or any pen of White P. Rocks, except one pen. They beat all the Buff Wyandottes, all the Buff Rocks, all the Rhode Island Reds, single or rose comb, except two pens, and they outlaid all the dunghills and mixed breeds; that is, during the month of July. In the grand totals they are exceeded by 59 pens.

GEO. A. COSGROVE.

Dune Alpin Heavy Laying S. C. White Leghorns
have won more firsts, specials and other awards in the last four years at New York, Boston, Hagerstown and Philadelphia than all our competitors combined.

PUBLISHER'S DESK

I sent Chas. Dodge, proprietor of the Wisconsin Gin-Seal Co. of Albany, Wis., 15,000 golden seal plants, for which he was to pay me $10 per thousand. He sent me $100 and refuses to pay the remaining $50. I sent him a few samples previously and wrote him that the majority of the plants would average between the middle size and two or three times as large as the smallest size, which was very small. He wrote me, "If the remainder of the roots you have are anywhere near like the samples, they will be entirely satisfactory." They surely did average better than I told him they would. I wrote him last Fall if he would send me $35 inside of 10 days, we would be even, but he would not, so he yet owes me $50. He wrote me this Spring that there were only about 10,000 stubs in all, and before that he said "The roots you send are sound enough, it appears, but are lacking in size badly." I have witnesses as to the quality and number of plants. If you can collect this or influence him to pay it I will greatly appreciate it.

Tennessee. C. D. R.

We took this claim up by correspondence with the Wisconsin Gin-Seal Co., and the firm contends that they only received 10,000 instead of 15,000 plants as claimed, and they were inferior quality besides. The subscriber claims to be in position to prove by disinterested witnesses his contentions as to the number and quality of the plants shipped, but a farmer in Tennessee cannot afford to go to Wisconsin to bring suit on account of $50 worth of plants. The loss of time and expense in doing so would perhaps amount to more than the value of the whole shipment. Without regard to the merits of this particular controversy, the claim of inferior goods and shortage of quantity is worn threadbare by receivers of farm produce who are willing to take advantage of helpless shippers at a distance. Our records show that another feature of the business methods of this concern was referred to in this department about a year ago, and we submit the experience of this subscriber for the guidance of shippers generally.

Kindly permit me to join the Anti Fake Club. I hope that the membership (like the R. N.-Y. family) may extend across the continent. Long ago I cut my subscription to one of the leading New England farm papers on account of their dishonest advertisers. I have had occasion to deal with several advertisers in THE R. N.-Y. and got a square deal each and every time. You may count me an active member of the club, willing to perform my part in making this club a "terror" to the class of advertisers who are not giving a square deal. They are parasites, preying on their fellow humans. I consider it a duty to help guard the unsuspecting widow or orphan against these unscrupulous "hot air" dealers. J. L. F.

Vermont.

We can see a great promise in the activities of the Anti-Fake Club. Up to four or five years ago THE R. N.-Y. was practically the only influence sincerely working for the protection of the public against fake and fraudulent concerns. Only three years ago the arch faker of America had no difficulty in buying page after page for the advertising of his swindling schemes in the publications, which, then as now, were making some pretense at a censorship of their advertising columns. It is easy enough to be virtuous in the face of a small order; but when orders for five pages come in dull months the publishers who make pretenses cannot resist the temptation. Such incidents test principles and sincerity. While the general movement for honest advertising is comparatively recent, it is now active. Vigilance committees are at work all over the country and are working earnestly to make advertising dependable and reliable. These men realize that deception destroys the efficiency of advertising, and makes it less valuable than it otherwise would be to honest houses. But they have not yet attacked the real source of the evil. They secure the passage of new laws, and occasionally prosecute and convict an offender, but the publisher who makes the fraud possible goes without so much as a reprimand. But the publisher is the key to the situation. If he honestly strives to exclude schemers from his columns, in three months the writing of deceptive advertising would be a lost art. This is the opportunity for our club. We will go straight to the fountain head. We will ask the publishers politely but firmly to exclude the advertisements that are found to be deceptive. If they comply, well and good. If they refuse, we will notify them that we want their publications no longer and we will refuse to accept them into our homes. When a publisher persists we may go to the extent of telling honest advertisers what our experience and our positions are in respect to such publications. We would have the co-operation of many of them. If the readers of THE R. N.-Y. alone, who are now probably 800,000 people all told, should follow this policy, they would rid the agricultural and literary publications of objectionable advertising in six months. We do not expect such a spontaneous demonstration; but we do expect practical results.

February 25 I found this advertisement in N. Y. American. I sent the $10 and about the last of May received a letter saying that no oil had been found so far, although a well had been drilled, but that they were looking at oil fields in Oklahoma. In June I got a letter and yellow slip for my name and address, stating that I was to have an interest in the Oklahoma fields. In July I got a letter asking me to buy shares in Oklahoma oil fields at 50 cents a share. (Later they will be $1). Is this a fraud or not?

New York. M. B.

The advertisement enclosed is a very clever appeal for $10 for investment in an oil scheme by Phebus & McCoy, Inc., Denver, Colo. It is about as alluring a piece of sucker bait as we have seen in some time. The advertisement paints all the prospects for becoming rich through the small investment and then cleverly explains that oil isn't always struck and the investor's money may go in a "hole in the ground." This apparent frankness is well intended to throw the prospective victim off his guard and it serves another purpose of giving the Government officials no grounds for prosecution on an alleged fraudulent use of the mails. Those who send promoters money on a pure gamble of this kind have no good cause to complain when they lose their money. The root of the evil is the publishers who accept advertising designed to extract money from inexperienced people.

I just bought from the U. S. Pheasantry, at Poughkeepsie, N. Y., 16 pheasant eggs, for which I paid $7; 14 of the eggs "rattle," the contents being loose, and the air space sometimes on the small end, sometimes on the side, as the eggs are turned about. The other two eggs seem to show birds when held up against the light. I wrote to the U. S. Pheasantry and am told they will do nothing about it, as the eggs are all right. I think the eggs are an unsuccessful hatch taken from some hen of their own. I have not put them under a hen, and have witnesses to prove that they were received in this condition. Will you let me know what you think of such eggs? Do good eggs ever rattle? MRS. M. G. D.

New Jersey.

We have never seen fresh eggs that "rattle" in the way this subscriber describes. Our subscriber for some years back may remember that this is not the first complaint that has appeared in these columns with regard to the U. S. Pheasantry of Poughkeepsie, N. Y., the proprietor of which is Mr. F. J. Sudow. We have given Mr. Sudow an opportunity to make adjustment with this subscriber, but he refuses to do so. The loss of Mrs. M. G. D. may be the means of saving some other subscribers from a similar experience.

I have never received payment for a case of eggs sent to B. Friedlander, 187 Duane Street, New York. Express company shows delivery. Can you collect?

New York. C. O. O.

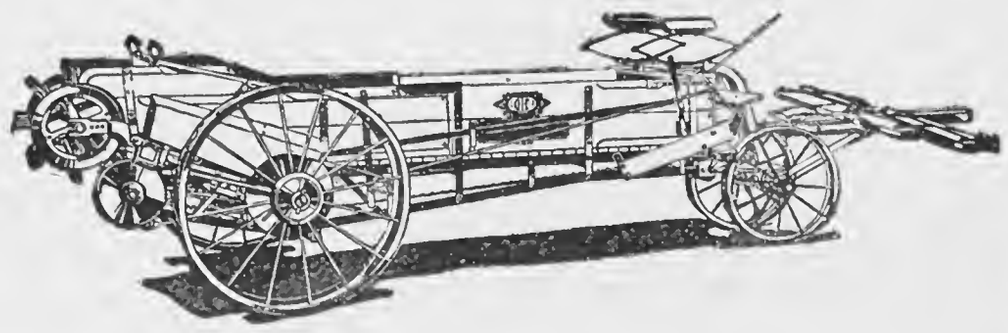
We could not induce Mr. Friedlander to send remittance and our attorney was also unsuccessful. Mr. Friedlander seems to be manager of a store at 1231 Stebbins Avenue at the present time, but he makes no effort to adjust this bill.

Can you give me any information about the Nassau Sales Company, 150 Nassau Street, New York? I received a circular of their solder. I sent for a sample. It came and was fine. I sent for one dozen, which came. I sold out and sent for a larger quantity first part of May, sending them a money order. I have never heard anything from them; have written three times and get no reply. See if you can trace them up as you do all frauds, and get my money back. My next order would have been for a gross, and I would have been robbed of $7.20 had they waited a little longer. J. C. F.

Louisiana.

Our advice is that they have moved and present address is unknown. Unless you have satisfactory reference or rating for foreign concerns, it is best to have goods sent C. O. D.

International Harvester Manure Spreaders



YOU cannot point to one detail in International Harvester spreaders that will not do its work well in actual field and yard service. Every part is strong and durable, built for long life and good, even spreading.

Among the features that will interest you are these: Simple protected beater driving mechanism, all of steel; load carried on rear axle, insuring traction; reversible gear and worm; low, easily loaded box, with ample clearance underneath; end gate, preventing clogging of beater while driving to the field, etc.

All styles are in the I H C spreader line, high and low, endless and reverse apron, and various sizes for small and large farms. Our catalogues will tell you more. Write for them and let us tell you also where you may see I H C manure spreaders.

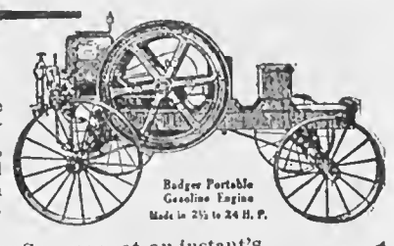
For Threshing and Ensilage Cutting

The "Badger" gasoline engine is the best power plant for the big jobs, like threshing and ensilage cutting. Reliability, plenty of power, steadiness and readiness, required for these big jobs, typify the "Badger." Made of the best materials; speed and parts made adjustable; the engine develops more speed than rated at less cost of fuel. Runs by gas, gasoline or kerosene. Consumes no fuel which is not turned into power.



Badger

The "Badger" is always ready to run—Winter or Summer—at an instant's notice. Every part guaranteed for five years unconditionally.

Products, Prices and Trade.

Wholesale Prices at New York,
Week Ending Sept. 4, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914.	1913.
April	$1.40	$1.50
May	1.50	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.10 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.61 and $1.51 for B and C. Hotels and restaurants using two to three cans per day are paying five to 5¼ cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

There have been no material price changes during the week, but the market is dull and weak, there being few sales at the top figures. Packing stock is comparatively scarce, with a fair demand for grades worth 21 to 22 cents.

Creamery, extra, lb	31	@	32
Good to Choice	26	@	30
Lower Grades	20	@	25
State Dairy, best	29	@	30
Common to Good	18	@	25
Factory	19	@	25
Packing Stock	19	@	22

Elgin, Ill., butter market 30½ cents.
Philadelphia, western creamery, 32 cents.

CHEESE.

The local market is dull and one-fourth to one-half cent lower. Reports from interior markets are rather more favorable, which may check further declines here.

Whole Milk, fresh, specials	16¼	@	16½
Average fancy	16	@	00
Prime	15¼	@	15¾
Under grades	11	@	15
Dalsies	16½	@	16¾
Skims, specials	13	@	14
Good to choice	11½	@	12½
Poor to fair	7	@	11

EGGS.

Qualities running choice to fancy are very scarce, and prices are one to two cents higher on these grades. Medium qualities are selling slowly at previous prices or lower.

White, choice to fancy, large	35	@	37
Common to good	25	@	32
Mixed colors, best	30	@	32
Common to good	22	@	25
Western fresh, white	25	@	30
Lower grades	18	@	20
Storage, best	26	@	27
Lower grades	19	@	24

FRESH FRUITS.

The apple market is still overloaded with windfalls and inferior Fall varieties. Choice McIntosh and Transparent sell up to $3 per barrel. Pears in rather heavy supply, except choice Bartlett. Peaches in great surplus, practically nothing going above $1.50 per crate. Grapes lower, good Moore's Early selling at 3½ to four cents per pound.

Apples—Alexander, bbl	1 50	@	3 00
Yellow Transparent	1 50	@	3 00
Duchess	1 50	@	2 75

White Kidney	6 75	@	7 00
Lima, California	8 00	@	8 15

VEGETABLES.

Potato prices remain as before, but the market has a stronger tone. Onions in considerable surplus, selling mainly at one cent per pound or lower. Peppers very low, except for red. Some extra fine Cauliflowers are arriving from up the State. Parts of Delaware County, about Margaretville, grow this crop to perfection very large, snow-white heads, protected with paper and packed so that they arrive undamaged. Flowers of this type have brought $4 per barrel, or four times the price of ordinary.

Potatoes—Jersey, bbl	1 50	@	1 85
Long Island, bbl	1 75	@	2 00
Sweet Potatoes, bbl	2 50	@	3 00

COMMERCIAL APPLES.

IN issue of August 15, under heading of "New York State Crops," you state: "apples for commercial purposes will be far below last year's crop, but the local crop will be made larger." Can you tell me just what this means? What is the government report on potatoes in the United States? A. K.
New York.

The intended meaning in N. Y. State apple report is that the proportion good enough for commercial use, will be much less than the entire crop, many of which will go to evaporators and vinegar factories or be sold at a low price locally. The apple branding law in effect in N. Y. State this year will probably lessen the amount of commercial apples, as many that would previously have been sold as good or unbranded will have to be labelled "unclassified," a term that will discount their value in market. The Government report puts potatoes at 79 per cent, one per cent. above last year and 4.1 per cent. below the 10-year average. W. W. H.

BUFFALO MARKETS.

I BOUGHT last week for 40 cents half a dozen ears of corn (eight cents), a head of lettuce (two cents), two muskmelons (10 cents), a quart of tomatoes (five cents), three cucumbers (five cents), a bunch of beets (five cents), and two quarts of string beans (five cents), though I had to pay $1 for a bushel of potatoes. Some of this produce is still cheaper now. The big rains have helped the potato crop, and the wholesale price is not above 90 cents. About the only leading crop that is higher than usual is peaches, which are above $2 a bushel wholesale for fancy, the few home-grown ones offering being of mostly low quality, wholesaling at 75 cents to $1 a third-bushel basket. Apples are going down, being very plenty and quoted at from 20 to 75 cents a bushel for poor to fancy. The quality is better than usual. Pears are becoming plenty at $1 a bushel for Clapp's Favorite and Flemish Beauty, and $1 to $1.50 for Bartletts. Plums are plenty at 10 to 18 cents for six-pound basket. Huckleberries retail for 12 cents a quart; elderberries, 75 cents a bushel. Cabbage is plenty at five cents for large heads. Eggplant is five cents for small and 10 cents for large. Celery continues to be plenty, ranging from 10 to 35 cents a dozen. Cucumbers are 25 to 40 cents a bushel; green peas, $1 per bag; shelled lima beans, 20 cents per quart; string beans, 40 to 90 cents per bushel; tomatoes, 40 cents per bushel. The melon crop is large, watermelons wholesaling at 15 to 35 cents, according to size, and muskmelons, home grown, at 25 to 30 cents per basket. The Western New York field bean crop promises to be very light, from drought, and prices are up to $4.25 for marrow and $3 for medium and pea. Onions are dull at 90 cents to $1.15 per bushel for home grown. Sweet potatoes are fine appearing and at about last season's prices, $1.50 per hamper to $4.50 per barrel. Butter is about four cents up from a month ago, but reported quiet, at 34 cents for extra, to 27 cents for fair crock butter. Retailers are not asking over 35 cents at the city markets. The cheese trade is steady at 15 to 18 cents, fair to extra. Eggs are also up to 33 cents for white fancy and 26 cents for Western candled. J. W. C.

TIOGA CO., N. Y., which in common with many other sections of the State has suffered from a series of droughts in the past few years that have made seedtime a hope but harvest a disappointment, has apparently entered upon a new era of abundance. Copious rains have fallen all Summer, and the hillsides of late August are as green as those of June. More rain has fallen in the third week of August than the entire month has averaged in the past. But little hay was stored without having been the recipient of at least a shower, though the crop was large and the quality of the best. Oat harvest is extremely difficult, and some will be spoiled before the most strenuous efforts can get it under shelter. Potatoes have not as yet been blighted though conditions for the fungus have been ideal; no rot is reported and the fields are a solid mass of green, many of them presenting the unusual appearance of full bloom. Buckwheat growth is rank and corn is the wonder of the natives. Moisture in excess and continued hot weather have furnished this semi-tropical plant with just the conditions it needed for its full development and many fields look as if they would have to be cut with an axe. Ordinary "State" corn is frequently seen with stalks over 15 feet in height and a forest-like density of foliage. Silos will not hold the corn intended for them this year and much will be fed dry. Pastures have remained lush all Summer and the hillside springs have not failed.
M. B. D.

Cattle 11; veal 11; hogs 10; butter 32½; eggs 25; wheat 80; oats 32; potatoes 1½ cent per pound; onions two cents per pound; tomatoes five cents per pound; beans 2½ cents per pound; cucumbers 30 cents per dozen; cabbage three cents per pound; rhubarb 1½ cents per pound. Strawberries four cents per quart box; raspberries, blackberries and Loganberries the same; peaches 50-60's, 45 cents per box; 80-90's, 30 cents. Gooseberries five cents per pound; currants six; cherries four cents. J. H. J.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—Job picking and packing apples on modern fruit farm. Address GEORGE DOWD, Madison, Conn.

HERDSMAN wanted; registered Jerseys; married man preferred; state experience, age, etc. CUPOLA FARM, West Claremont, N. H.

FARM PARTNER WANTED to work with owner on shares; New York State; married man preferred; particulars exchanged. OWNER, care Rural New-Yorker.

WANTED—Working manager or foreman on small farm, general farming, fruit a specialty; must be experienced; single preferred; state wages expected; answer Box K, care Rural New-Yorker.

WANTED—Married man, strictly temperate; understands poultry breeding and production of fancy eggs; market poultry; also take charge of piggery; wife to assist in housework; good cook, no children. Box 15, Stevensville, Sullivan Co.

WANTED—Boy or young man for barn work and help in creamery, modern equipment throughout, run small route, experience not necessary; ability to learn and willingness to work only required; also man for cow barn. Box 86, Elmhurst, Pa.

WANTED—Position as farm or estate superintendent; practical experience in farming, fruit growing, dairying, poultry, incubators, farm machinery and building construction; experienced carpenter, plumber, etc.; married; best references. N. K., care Rural New-Yorker.

FARM MANAGER—Married; must be able to raise truck, chickens and fruit, and be able to dispose of same at market prices; to a man of this standing I am willing to pay one-half of the profits. Farm is located at North Water Gap, Pa. Address all correspondence to F. A. MARON, 94 Chambers St., New York city.

A PRACTICAL HERDSMAN seeks position; am Scotch, married, 1 child, age 28 years; have been in this country several years and have held positions as herdsman and dairyman on some of the largest estates in the East; am well qualified and can give highest credentials. Address A. D. STEVENSON, Griffin Farm, Portchester, N. Y.

WANTED—Herdsman, unmarried, well recommended, for 200 cows; well experienced with feeding, breeding, accustomed to handle bulls; must be a sober, strong, energetic man, capable to handle twenty milkers and keep upright strict order; good wages, steady position. Send full particulars and references in your first letter. Address L. F., Care Rural New-Yorker.

FARMER WANTED—Exceptional chance; on shares or percentage of profits; married; small family; on 20-acre Jersey farm, 6-room house, near Philadelphia; berries; 1,000 peach trees, grapes and early garden truck; must furnish horses, harness and wagons; no barn; all else; give age, size and age of family; references, experience and all details in first letter or no attention will be given. JAMES R. GWILLIAM, Merchantville, N. J.

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

FOR SALE—Farmers' cement drain tile machine; nearly new. W. VANDERVEER, Port Ewen, N. Y.

FOR SALE—A 1½ horse power steam boiler, steam turbine bottle washer, wash trays, etc., for a bottling milk plant; also a Bowsher feed grinder. CHARLES H. EVANS, Gaylordsville, Conn.

250-ACRE stock and potato farm near Buffalo; $50 an acre. ALBERT D. JAMIESON, 844 Ellicott Square Building, Buffalo, N. Y.

WANT TO RENT, option purchase, truck, fruit, poultry farm; Pennsylvania preferred; desirable marketing facilities. GERALD STANLEY, South West Harbor, Maine.

FOR SALE—100 acres in Central Ohio; good grain or stock farm; would take live stock as part payment; registered preferred; for description write R. T. LAIRD, Marysville, O.

FOR SALE—85-acre farm near macadam road; five minutes' walk to trolley; good land; good buildings, good orchard; plenty water; price reasonable. H. FREDERICK, Brunswick, Maine.

FOR SALE—Dairy farm 170 acres; good buildings, good water; under good cultivation; keeps 40 head; four miles from village; three from two creameries. JAMES M. BONTON, Roxbury, Del. Co., N. Y.

FOR SALE—Ideal farm of one hundred acres; the land is deep, rich soil, capable of producing anything; good fourteen-room house; good barns; has been in family forty years; owner must sell. Address Box 165, Cazenovia, N. Y.

FOR SALE OR LEASE—Ten acres good land, story and half bungalow; new; heat and water, barn, chicken houses for seven hundred layers. Excellent neighbors, macadamized roads, mile and half to Freehold. ARCHER CROOKS, Freehold, N. J.

NOTICE—A fine farm of 160 acres in Ingham County, Michigan, 5 miles east of the City of Mason, will be sold at public sale on said premises by administrator, pursuant to order of Probate Court of said county Sept. 26th, A. D. 1914, 30 acres of fine timber. MERRITT HICKS, Administrator. Business address, Dansville, Mich.

FOR SALE—1,621 acres, farming, grazing and timber land in Allegheny Co., Md., 11 miles from Cumberland, on North Branch River, C. & O. Canal, and West Maryland R. R. runs through property; near churches and school. Will sell in one parcel or divide in sections. Liberal terms. R. M. W., care R. N.-Y.

NEW ENGLAND FARM FOR SALE—To Close Estate—Forty acres cultivated land; eight acres of pasturage and good apple orchard; high ground; good view; four miles from Atlantic Ocean, in the town of North Stonington, Conn. Modern thirteen-room house and small barn; good water; one and one-half miles from trolley, and near State Road. Address ALLYN L. BROWN, Admr., Norwich, Conn.

TO "RURAL NEW YORKER" READERS: EASTERN HOME BUILDERS AND BUILDING MATERIAL BUYERS Never Had a Better Chance Than GORDON-VAN TINE OFFER RIGHT NOW—Write

To Rural New Yorker Readers

I just returned from a ten days trip to the East. I find that the lumber and Millwork sold by Wholesalers and Lumber Yards down in that territory is pretty poor material compared to the Graded Up Highest Qualities we are shipping. Our eastern customers certainly ought to be pleased with the quality of lumber and Millwork they get from us.

All this leads me to believe that as we advertise more strongly in the east, particularly in New York state and Pennsylvania and bring home to the customer still more strongly, the fact that our lumber is surfaced and not rough, that it is even in width, and not uneven, that it is high grade, instead of knotty and crooked, that our plans are complete and easily followed, and that they are up-to-date and not ancient, we should greatly increase our eastern business.

I find that in sections of the East that I was in, the old costly methods of buying and building and selling lumber and all building materials is still in vogue with the lumber dealers.

I have come to this conclusion after talking to men in all lines of business from the saw mill, right through the planning mill, the local dealers, the farmer, and the carpenter.

Our lumber is all well surfaced, true to size, bright, new stock, uniformly better than that sold in the eastern states.

Instead of using various kinds of wood and mixed grades, we standardize our grades and use the very best soft short leaf yellow pine for all framing lumber, boards, etc. with high grade cypress and cedar products, where exposed to the weather.

Our shipping facilities are such that we can ship into all eastern states to great advantage and actually show a nice saving to eastern customers.

Our plan service is unexcelled and the average farmer in the East, if he realized it, would be only too glad to take advantage of the service which our architectural department offers both on stock house plans and on special plans for houses and outbuildings.

Yours truly,

Sales Manager.

GORDON-VAN TINE CO.

5000 BUILDING AND REMODELING BARGAINS SHIPPED ANYWHERE

EASTERN HOME BUILDERS, and Lumber, Millwork and Building Hardware *Buyers* should carefully investigate the satisfaction and savings *offered right now* by Gordon-Van Tine Company.

Save $200 to $500 or More

in your home or any building. Save $200 to $400 per car on lumber. Surfaced Lumber—not rough. Even widths—not uneven. Graded-up—not down. Highest Quality—not crooked or knotty. No "number 2" boards shipped as "number 1" grade. No carelessness. But most rigid expert inspection of every piece shipped from our mills direct to you.

Our plans are complete, correctly made. Latest exclusive designs shown in $10,000 Plan Book of "Quality" Homes. Easily followed specifications.

"Guaranteed Right" cost estimates furnished FREE. Prices Low and Quality always the Highest in the market. Delivered to you promptly under the hardest competition right where you live and sold to you under legal-binding guarantee. You are the final sole judge of quality and satisfaction always when you deal with Gordon-Van Tine Company. Write today.

PROOF: Special Fall Bargains Delivered at Once in Eastern Territory

Jap-a-Top Roofing

Beautiful—Durable. Surfaced with genuine Slate. 2 colors—Red and Grayish Green.

$2.25 Per Roll of 108 Square Feet

Price per sq. of **Jap-a-Top Shingles** 424 Shingles $4.75

Also Other Quality Roofing as low per roll of 108 sq. feet, 90c.

Wallboard Bargains

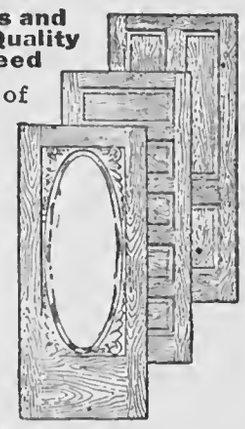
Wallboard is The Great Modern Substitute for Lath and Plaster. Also fine for partitions to finish off rooms, attics, etc. Comes in sheets ready for use. Goes on dry. Coldproof, vermin-proof, handsome, durable. **Beats Plaster. Costs Less.** Wallboard costs 50 per cent less to lay. Lasts as long as the building.

Quality Wallboard
1000 Square Feet, $22

See Special Wallboard offers in Grand FREE CATALOG.

Doors as Low as 77c

All Styles and Sizes — Quality Guaranteed



Hundreds of special designs, glazed and unglazed. Oak, White and Yellow Pine, Cypress, Fir, Oak Veneer, Solid Yellow Pine and Front Doors.

Shingles

Extra "Star A Star" 6 to 2 inches. Washington Red Cedar Shingles, price per thousand $3.10. Special prices on Bevel Siding or Clap Boards, Red Cedar Siding, White Pine Siding, etc.

Storm Sash and Doors

Make snug for winter NOW. All sizes, All styles. Also builder's hardware, hinges, knobs, locks, catches, buttons, etc. "A" Quality and Painted.

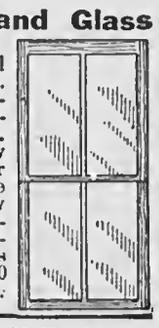
All White Pine STORM SASH as low as 72c. STORM DOORS as low as $1.43.

LUMBER In Car Lots

Save $100 to $300! Our special Latest Lumber List and FREE Book above offer choice to you of millions of feet of clear, dry, clean, seasoned lumber at Wholesale Prices. Dimension, heavy joists and Timber, Drop Siding, Beveled Siding, Ceiling, Partition, Wainscoting, Finishing Lumber, Laths, Shingles, Boards, Posts, Poles, Battens, etc. All lumber graded in accordance with rules of the Lumbermen's Association. All Millwork of High Quality Standards, established by the Northwestern Sash, Door and Blind Mfrs. Assn. Every stick guaranteed up to standard quality. Estimates furnished FREE on guaranteed costs to you. BARGAINS in Moulding and Finish. Many special designs. All latest new stock. See Big Reductions in 1914-1915 Grand Free Millwork Catalog, just out.

We ship promptly to anywhere you live by Fast Freight—Safe Delivery, Quality and Satisfaction Guaranteed or Money Back.

Windows and Glass



Check Rail windows, 74c up. Plain rail, glazed, 66 cup. Transoms, 40c each. 8 x 10 window glass, 3½c per light. Any size at equally low prices. Safe Delivery Guaranteed. Dealers charge 5 to 10 times our prices.

MARKETING THE TIMBER CROP.

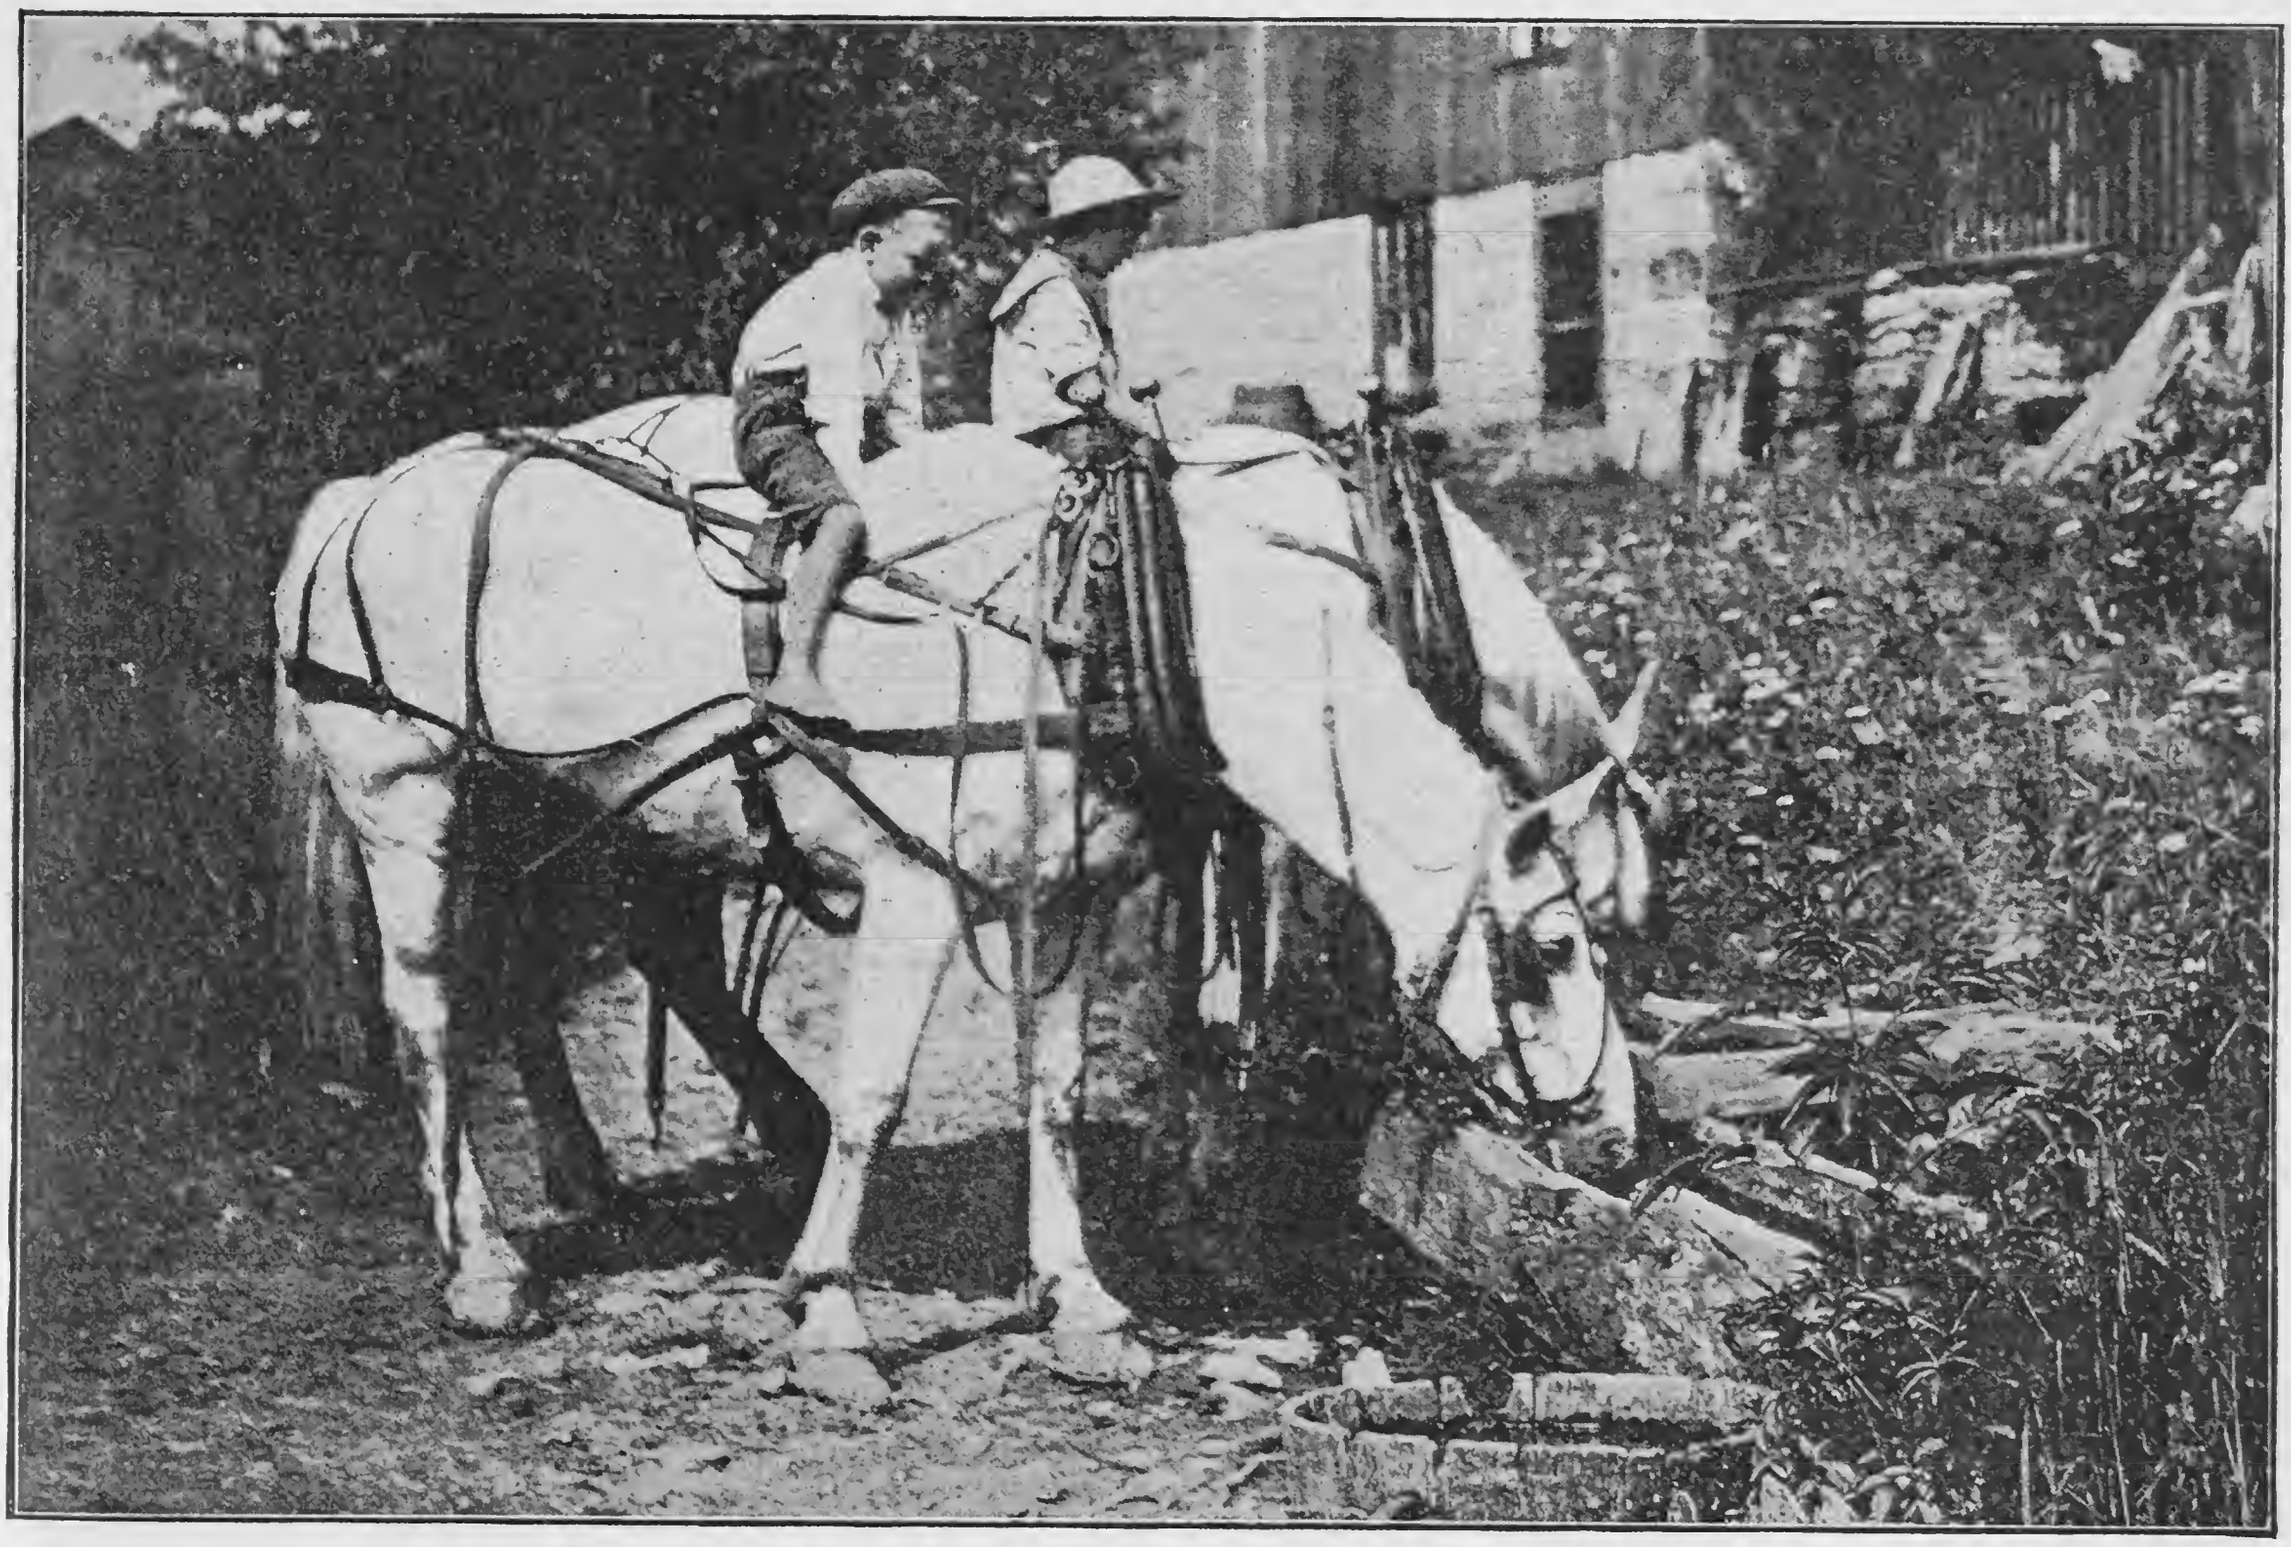
A Farmer's Actual Experience.

CONDITIONS INVOLVED.—I notice that the sale of timber is a matter that is interesting some of THE R. N.-Y. family. I have a little experience along this line; while I am by no means qualified to speak as an expert on this subject, still I discovered a few of the ins and outs of the business. When I purchased my farm it contained two small tracts of timber, one of which, containing about 15 acres, was an old sugar bush. This sugar bush consisted of old trees, tall and straight of trunk, which had reached their prime, and in many cases, had begun to deteriorate. I had no outfit for sugar-making, and furthermore, had not the capital available for its purchase. In view of the condition of the trees it did not seem advisable to go in debt for tools, and it was evident that the value of the woods for timber was not increasing. But marketing a crop of timber is an altogether different proposition from marketing most crops. To hear all the talk about the increasing scarcity of timber, and the necessity for its conservation, one would believe that timber buyers would be falling over each other to get a good tract. I did not find this to be the case.

GETTING AT TIMBER VALUE.—My first step was to put a price on my trees. I confess that I had a very meager idea as to the value of standing timber, nor do I know much about lumbering, and almost nothing in regard to the lumber trade. Plainly, I needed expert advice, so I wrote to the College of Forestry at Cornell for help. They advised me to sell the timber on the stump, rather than to try to market the lumber myself, saying that the condition of the hardwood lumber trade and the system of grading was such that an amateur was almost sure to be beaten. However, they of course could not give me an idea of the stumpage value without inspection, and that was at that time impracticable. I suppose it is good business to buy as cheaply as possible, and this rule seems to be worked to its utmost in the purchase of timber. The fact that most people, like myself, do not know how to estimate either the amount or the quality of timber makes it easy for the buyer to make a purchase at a figure little short of a gift.

LUMBERMAN'S ADVICE.—Not being able to get practical advice from the College of Forestry, the only course left was to get some experienced lumberman or timber dealer *who did not want to buy my timber*. Now it happened that in our town was a man who had had considerable experience in buying woodland and marketing the finished product, but who had retired from active business. I asked his advice, and he said he would be very glad to look over my timber. So a day was appointed and we went over the ground as thoroughly as possible in half a day. He estimated the timber at 250,000 feet, mostly maple, with some beech, elm, basswood and Black cherry. The value lay, he said, between $1,500 and $2,000. He advised me strongly against trying to market the product myself. "They will beat you on scoring," was the way he put the same advice the college had given me. "Moreover," he said, "it needed an expert to superintend the job, from cutting the trees to sawing the lumber."

THE HOME MARKET.—Then I began writing to lumber dealers, far and near. Not all of them even replied, but most of them wanted the particulars *and the price*. Then they faded away. I kept it up, however, and at last got a man to look at the timber. He was favorably impressed with the better part of the maple, but his factory was so situated that the logs must be hauled on two railroads, and the freight would have cost more than the timber. He wanted stuff for veneering, and therefore could not use sawed lumber, which would make freight and handling charges higher. He wanted me to set a price on the choice of 300 trees, but that would leave me a lot of unsalable culls, and I let the matter drop. For several months nothing more was done. I had exhausted the list of purchasers, and had to quit. Then I found I had committed a fault which I believe is too common with us farmers. I had overlooked the home market. I had cut some



HAPPY DAYS! GIVING THE TEAM A DRINK. FIG. 490.

logs for home use, and while drawing them on the logway at our home mill the owner asked me if I had any more like that to sell. I immediately set forth the facts of the case, and he said he would be up to see me in a few days. At about the same time I ran across another timber buyer, and soon had the two making a careful examination of the woods, though not at the same time, for I did not want the two parties to go in partnership on the deal. The best offer either would make was $1600, and after some bickering I concluded I could do no better and closed the deal with the local mill owners. The terms were $500 cash and the balance in two months, with two years in which to remove the timber. It is well to have all the agreement in the written contract, then there is no chance for contention. Also specify the right of way, so that the lumberman cannot drive all over your farm. The sawing timber was removed this last Winter, and it has turned out of rather poorer quality than expected, so that while the buyers will make a good profit, yet they could scarcely have paid more and come out with a profit. And my friend's estimate of the quantity of timber has proved just about correct, though none of the prospective buyers would admit it first.

POINTS FOR CONSIDERATION.—There are a great many factors to be taken into consideration in determining the value of a piece of timber. Freight rates are of great importance in this matter, also the distance from the railroad. A few years ago a survey was made across the corner of my timber lot, and if the railroad had taken this route it would have added several hundred dollars to the value of the timber. However, the road took a different route. Then the cost of cutting, hauling and sawing timber is considerable, under the most favorable conditions, and with unfavorable conditions such as rough hilly land for lumbering, bad roads and bad weather, the expense is still further increased. Probably the people who bought my timber handled it much cheaper than I could have done. They were experienced lumbermen, with several big teams and all the necessary paraphernalia, which I should have had to buy, and which would have been useless to me after the job was done. The lowest estimate I could get on cutting was $1.25 per thousand, but they got it done for one dollar. Probably the man who took the job lost money on it, or at least failed to make anything, but that was his lookout. If I had tried to hire teams to draw logs it would have cost $4 per thousand. The lumbermen were wiser than I should have been, and paid one dollar per trip, loading the logs themselves and providing help to unload. A man could make four or five trips daily, and as it was all the way down grade and good sleighing, they drew very large loads. The record load was 2,100 feet, a large elm tree. However, it was not a profitable trip, as the sleighs were broken by the load. The lumbermen saw to it that the drifts were kept shoveled out and the thin spots covered with snow, so that as large loads as possible could be drawn. They also provided a team to double up some small grades in the woods at some of the skidways. If I had put in a mill on my own premises it would have meant considerable capital tied up before the lumber would be ready for sale, besides taking a lot of my time until the timber could all be sold, and I find it hard enough to keep my farm work up without a lumber yard to look after.

THE BUYER'S RISK.—Lawyers have a Latin expression which freely translated means that the buyer must take the risk. This may be law, but in practice this does not always apply. The timber buyer goes over a tract of timber quite carefully, counting and measuring the trees and noting their condition. They say a tree is no better than it looks. A smooth nice shell may cover rotten wood, but a tree that is knotty, crooked and full of holes has nothing of value inside unless it be 'coons or honey. So the buyer discounts his total enough to make up for the hypocrite trees. Thus the buyer gives himself the benefit of the doubt. If the trees are not as good as they look he is safe. If they are better, he wins. Of course a man sometimes loses money in buying timber, but it is generally because he is an amateur. In conclusion, I would advise the man who is unfamiliar with lumbering and the lumber business to let it alone. If you sell your timber on the stump you can put the money in your pocket, or wherever you like, and go on about your business. If you market it yourself you have a lot to learn. This of course applies to considerable quantities. If you can cut it a little at a time until you get into the business the thing is different. But at any rate, go carefully. If you make a blunder in marketing a crop of potatoes you perhaps may do better next year, but having disposed of your timber it will be many years before you have another crop.

New York. CHESTER L. MILLS.

WHEN TO SPREAD MANURE.

I HAVE several carloads of horse and cow manure, and would like to keep my man busy hauling it out, but do not know just where to put it so it will produce the best results. Would it be advisable to use the manure spreader and put it on top of old meadow, then plow it under this Fall, or would you plow and spread it on after plowing? Part of the land to be plowed is of a gravelly formation, the remainder is sandy, no gravel at all. Do you think once over enough to go with the manure spreader? In this section most farmers spread manure by hand, and their fields look as though they put it on thicker than my spreader does.

Sheffield, Pa. C. W. E.

If your land is reasonably level, so that the water does not run over it in a flood, we should put out the manure at once, or at any time when convenient, and spread it over the whole meadow to be plowed under next Spring. On the whole we think this is a better plan than to plow in the Fall when corn is to be planted on this sod. This plan is followed largely through central New Jersey as a part of the rotation known as chemicals and clover. In this rotation all the farm manure is spread upon the sod, usually in late Summer or during the Fall. In the Spring this sod which was manured in this way is plowed under for corn planting. Experience shows that the manure spread at this time and left on top of the sod through the Winter does not lose its plant food, while it does give an increased Fall growth of grass to be plowed under in Spring. This matter of applying manure whenever convenient, or holding it under cover in the barn, in order to be hauled out in the Spring, is very largely a matter of convenience and farm management. On level grass land there will be very little loss if the manure is hauled out day by day, or whenever the teams would otherwise be idle. In the Spring the work usually crowds too much, for a dozen jobs ought to be done at once. Our own plan is to leave the manure on top of the ground on the grass, and put it under just before corn planting time. It is probable that once over with your manure reader, if the feeding attachment is left wide open, will be enough. Where the manure is spread by hand it is not as fine as when it comes from the spreader, and the larger chunks may make it appear that more manure is going on, but this is not the case with the finer manure from the spreader and probably you are putting on enough when you go once over with a good machine.

SHALL WE USE POTASH?

THE farmer who thinks, may learn a good deal by the possible potash pinch. For one thing, I am perfectly sure that most tobacco land which has been liberally dressed with potash year after year will yield good crops for two years or more with no potash added. I know of two of our best growers who dropped potash out of their formulas entirely for at least three years, and had as good quality of leaf as ever. Why should not the same thing hold with other crops? If potash has been used in a niggardly way for years, of course to cut it off entirely will cut down the crops. But if it has been used liberally I do not believe that cutting it out one year will make nearly as much difference as the vagaries of our seasons make.

If potash prices soar I shall put none on my orchard, for there is where I think it will be least necessary to use it every year. The tree roots I have spread wide by broadcasting all my fertilizer, and they have got six or seven months in which to feed. If prices increase by one-half I will not use potash *anywhere except* on potatoes, and I will use at least 75 pounds of actual potash per acre on them if I undertake to grow them. But what I should ordinarily spend in potash at normal rates I will spend in acid phosphate and basic phosphate, and I think a man who trims his potash but puts on all the more phosphates will think seriously of revising his formulas in that way, even when potash resumes its normal price.

Many even of our experienced market gardeners would be agreeably surprised at the result of using 500 pounds of lime and 300 extra pounds of acid phosphate on cabbage and turnips next year. I fully believe the teaching that we need to use more phosphates than we are using. I also am sure that on such soils as we have in this State the use of raw phosphate rock is much less profitable than the use of acid phosphate, fine bone or basic phosphate. Applications of slaked lime in Winter or very early Spring will help to make the soil potash more soluble, to be sure. I believe in liming rationally at any time, but I doubt the wisdom of a specially heavy dressing of it to *squeeze out* potash.

I see no present prospect of a potash substitute. The street urchin wrote in his Sunday-school teacher's autograph book, "Keep cool, 't won't last. Nothin' does." Let's keep cool. Seed time and harvest are going right on. Emperors cannot stop them. Neither can a temporary shortage of potash cut the yield much where the land has been properly fed in past years. What we don't spend for potash let us spend for phosphates and perhaps nitrogen.

Conn. Exp. Station. E. H. JENKINS.

THE GOVERNMENT CROP SERVICE.

How Statistics Are Gathered.

We have had a number of letters from persons who say that they do not know how the Government obtains its figures showing the reported conditions of crops. How are these figures developed and what is the basis for figuring? Some of our correspondents tell us that they did not know that there was any reporter in their township or county, and therefore they want to find out how these figures are made up. Following these requests we have obtained a report from the Bureau of Statistics at the United States Department of Agriculture, and this interesting statement follows.

TWO STATES DISCUSSED.—I will review the basis of information for the States of New York and Pennsylvania. This Bureau has in New York 1,187, and in Pennsylvania 955 township correspondents who report to it monthly upon printed schedules of inquiry, furnished them for that purpose, concerning crop conditions in their respective communities. It has also a county correspondent in each county of both States who responds monthly to the same inquiries. The county correspondent is assisted in making his estimates by several aids who report to him from different parts of the county.

AGENCIES EMPLOYED.—A State Agent is employed in each State who maintains an independent list of selected correspondents, numbering about 300 in New York, and about 200 in Pennsylvania, who report direct to him and upon whose reports, supplemented by his own observations and personal inquiry, he bases a monthly report to the Bureau for the State as a whole. A traveling field agent also makes similar reports basing his estimates partly upon reports from a smaller list of aids, many of whom have knowledge of conditions over considerable portions of the State, and partly upon the results of his own personal observations and inquiries gained through careful travel throughout his territory each month. These agents' territories include from one to four States, usually two, and they report separately for each State. Reports from these four sources of information are identical as to the questions asked, and include all of the general questions regarding acreage, condition and yield of farm crops; numbers, condition and values of farm animals.

SPECIAL CORRESPONDENTS.—Supplementing these sources of information, the Bureau maintains special lists of correspondents to whom inquiries are addressed regarding special crops. For instance, in making its general acreage and yield estimates it has the additional reports of about 700 representative farmers not included on its usual list for the State of New York, and about 450 in Pennsylvania. For acreage and yield of wheat it has reports from a list of 150 mills and elevators in New York, and about 250 in Pennsylvania. Its live stock reports are supplemented by estimates from about 200 special live stock correspondents, including veterinarians and live stock dealers in New York, and about half that number in Pennsylvania.

ACREAGE ESTIMATES.—The basis of the Bureau's estimates of acreage are found in the Census enumerations. This Bureau accepts the figures established by the Census for the census year, and by applying to this its estimated percentage of increase or decrease based upon reports of its correspondents and the investigations of its special agents, estimates the approximate change in acreage from year to year. By applying to this estimated acreage its estimate of yield per acre, it determines the estimated total production for the State. Similar methods are followed in arriving at the numbers and values of farm animals. By observing the relation of average conditions from month to month to average yields for a series of years, it computes and publishes a monthly forecast of probable final production provided growing conditions for the remainder of the season conform to average.

VALUE OF REPORTS.—The value of these reports to the community at large, and to farmers in particular, is that they furnish a crop estimate based upon the opinion of those in immediate touch with and best informed on the subject, supplemented and checked by the investigations of trained traveling agents. Without this report, the producer, the consumer, the manufacturer, the railroad manager, and business men generally, all of whom are vitally affected by the harvest, would be compelled to depend largely upon crop estimates issued by private interests. Information of crop prospects and outturn is imperative and such information will always be forthcoming though not always dependable. The value of the government report resides not alone in its substantial accuracy and dependability, but largely also upon the fact that it is a government report carrying thereby the assurance that it is prepared without bias. That this information, assembled with so much care and thoroughness, may be received with confidence by all concerned and thus render a maximum of benefit, the handling of the data received at Washington is surrounded by every safeguard to prevent any wrong interpretation of the figures or unfair use of the valuable information.

PREPARING ESTIMATES.—The estimates are prepared by a board composed of several trained statisticians attached to the headquarters of the crop reporting service at Washington, with the assistance of two crop experts from among the traveling field agents who are ordered to Washington each month for service on this board. The custom has recently been inaugurated of calling to the assistance of the Board from month to month census experts or specialists from the technical Bureaus of the Agricultural Department, who may possess special knowledge of the important subjects of inquiry for the particular month. For instance, in January, in connection with the live stock report, the Board included the Chief of the Division of Animal Husbandry of this Department; for the March report, in connection with the estimates of grain reserves, it had the assistance of the Cerealist of the Department. The information upon which the Board acts is not assembled until the morning of the report. Before the reports from the different sources are examined, the doors to the Bureau are locked, the telephones disconnected, and all other means of intercourse with the outside suspended until the report has been prepared and given to the press. The report is made public at a time announced beforehand, in order that all desiring the information may receive it at the same moment.

LEON M. ESTABROOK.
Chief of Bureau.

THE FIGHT WITH QUACK GRASS.

How to Battle With the Pest.

PART II.

HOW PLANT GROWTH TAKES PLACE.—The principles of plant growth that should be known in this case are: The purpose of the plant food stored in the nnderground stem is to mature the seed of the plant, and second, that the plant cannot make any more food for itself unless it can get some green surface above the ground. The sole aim of plant life is to reproduce itself. The wild flower does not grow with beautiful petals to dazzle man but rather to attract some insect which may pollenize it and thus help in maturing the seeds. The plant food stored in the quack grass stem is for the purpose of multiplying the plant through mature seeds. Now, as long as the plant cannot get any green parts above ground, no more plant food can be made and all that the plant has to nse is that which has been previously stored in the root. There are very few plants which can make their food in the absence of green leaves and sunlight. The chlorophyll or green portion of the leaf is simply a mill in which carbon dioxide from the air and water from the soil is united and starch is formed. In the case of the quack grass, this starch is conducted down the above-ground stem and stored in the underground stem. If the mill is destroyed, there is no starch to conduct.

BRINGING ROOTS TO SURFACE.—The aim of Summer fallowing is to bring the roots of the weed to the surface and to kill them by the sun's rays and exposure to the winds and also, to keep the plant from getting any green portions above ground. This makes the plant continually draw upon the supply of plant food which is stored below the ground. When this is exhausted, there is nothing more for the plant but to die. After death the roots decay and go to make humns. The tools to use after the plow in keeping the quack grass down are the spring-tooth harrow and the barley fork. Do not use the disk harrow. It cuts the roots up fine, and we have seen before why one of these pieces of roots having a bud on it will grow again. The spring-tooth harrow serves two purposes, it rakes the roots out where they can be gathered up in piles with a barley fork, and it keeps the green parts from developing above ground.

POLE ATTACHMENT FOR SPRAYING A MELON FIELD. FIG. 491.

COMPLETING THE WORK.—The remainder of this season and next season will surely eradicate the quack grass in W. M. J.'s orchard, that is, between the rows of trees. He should go over the orchard carefully every little while, and hoe the quack grass out that is around the trees. I. J. MATHEWS.

ENTERING THE EGG CONTEST.

CAN you tell me why some of the poultry keepers—particularly those who claim most for their stock as layers—do not enter one of the egg-laying contests? J. K. L.

"He is of age—ask him!" We can think of no better way of finding out. THE R. N.-Y. is not a mind reader and we find that some knowledge of mind-reading is necessary in order to obtain some kinds of information. Various reasons have been given us. 1. The cost. At Storrs, entrance fees for 10 birds are $20. We think that if a man is to continue in the poultry business and claim to sell pedigreed utility stock, $2 per hen is a small price to pay for a certified record. 2. Hens do not have suitable care. Many breeders claim that the success of their hens is due to the personal care which can only be given them at home. That is probably true, but the buyers cannot take this personal care along with the hen. We think the average buyer wants to know what the hen can do out in a fair contest with other hens. When a man buys a motor car he judges it by its work out on the regular streets and roads, not on some private track where the conditions are ideal. Very likely if we were to get at the real reason we should find that a good many hen men, like other characters of history, "fear to put it to the test." It is very much safer to rely upon private claims or upon some particular "system" for praising the stock. Suppose some man who for years has claimed superiority for his stock were to select 10 hens and enter them in a contest. If they made a good record all his claims would be officially corroborated and it would be impossible for him to obtain a higher endorsement. On the other hand suppose the 10 hens flattened out and made but a poor record. There might be a dozen fair reasons for it, yet the record would stick like a leech to the large stories which the hen man had been telling! We think the time is coming when these egg-laying contests will play as large a part in the reputation and sale of utility poultry as the official milk and butter tests now do in the sale of cattle.

THE STOREKEEPER'S SIDE.

IT is our desire to give all sides of a public question a fair hearing. Since parcel post was started there have been many letters about the middleman and the country store-keeper, most of them arguing that the latter is not needed. It is fair to give the store-keeper's side as we do in the following letter. This will end the discussion, as all the arguments have now been presented.

THE FARMER'S DISADVANTAGES.—May I have the space to present my version of C's reply, page 987, to my letter on page 830. It is not my wish to start an argument, but I do desire to make very plain the facts, and as anyone without prejudice can readily see if he will but stop to reason, before making wild assertions about a business he has not even had a rudimentary experience in. The trouble with the farmer is he has had to fight his own battles with droughts, floods, cyclones, fire, with every conceivable kind of plant and animal disease, tree agents, and gold-brick men. At the end of the season he hauled to market (often many miles over impassable roads), what he was able to salvage of his year's endeavors and received what the buyer chose to offer, in fact, the 35-cent dollar. After paying interest, taxes, insurance, hired help, doctor bills and "forty-eleven" other bills, he applied what was left (provided there was any) on the merchant's bill for goods he had purchased at the merchant's own price. Many generations of this sort of existence without the broadening influence that has come with plenty of good reading, rural delivery, telephone, good roads, etc., has produced a race that, as a class, is resourceful and independent, but also predjudiced and pemrious, bordering on narrow-mindedness. I know, for I am one of them, hence they were ripe when the mail-order houses opened up their campaign and had no compunction in kicking the merchant's foot off their neck, notwithstanding they owed him for value received, and every dollar they sent away was gone for keeps. Eventually the storekeeper must curtail his stock in proportion, thus making a poorer selection of goods, from which to choose his immediate, daily necessities and injuring the community generally. What would any town be with the much-abused store obliterated?

THE STORE-KEEPER AND CATALOGUES.—C suggests we keep catalogues from which nine out of 10 would be glad to avail themselves, paying us a small profit. I have been doing this for some time, and in order to encourage people to use this method have sold at the smallest profit consistent, but the thorn in this fine theory is that only about one in 30 will avail themselves of the opportunity. Approximately one in one thousand will pay with order; about one out of 10 will "come across" when they get the goods. Therefore, may I ask how we can be expected to cope with the city establishment that has your money before they ship your goods? Mind you, the bulk of your order comes direct from factory, not from their stock, so they are out nothing for cartage, freight, interest on investment or insurance, besides, their volume of business enables them to buy as jobbers while we must buy of jobbers.

CASH BUYING.—There are a few merchants so situated they have a monopoly on their line, and can demand spot cash, but the average have just so many customers, and the limits of territory are such he can draw no more. It is imperative he retain these customers in order to keep business moving. It is inevitable he take some chances; for instance, an honest, industrious fellow purchases or works a farm. You give him credit against the sale of his produce. Through no fault of his crops fail or prices are low, barn burns or there is sickness in the family. You are compelled to carry him another year or lose his trade for all future time. Or on the other hand, a wealthy farmer will run up a large account, and then become indifferent as to payment, while if you are persistent with your statements he will get sore and trade elsewhere. I presume this is what our brother terms a no-good business system. Will he give a remedy?

POOR CREDITS.—Practically every one can tell us how to run a store, but mighty few have the courage of their convictions to put their theory into practice. It is not just the dead beat that adds the tax, for we can usually protect ourselves against them, but also the worthy, but unfortunate, and those who are able to pay but don't; also the uncertainty and long intervals of farm returns, and the fact customers will not observe the same consideration in meeting the store obligations that they will of a bank. It is unfair to compare the country mercantile with the banking business. Contrary to C's assertion, the suckers *do* eat their way through the supposedly impregnable banking system to the tune of many millions yearly. We all know of some who have lost their life savings, and of banks that blew up because their collateral was no good. Cassie Chadwick "put over a few" on the big fellows. If the country merchants ever organize and form an ironclad cash-on-the-spot system, an awful wail will go up from the consumers (rich and poor alike) and clerks will be a luxury. It is utter nonsense to intimate that the country retail merchant can ever sell on an equal footing with the city house, not while he is compelled to take his pay in poor butter and dirty eggs at top-notch prices. You will always have to pay something for service and the accommodation.

WHAT EXPERIENCE SHOWS.—To sum it up, there can be no mutual improvement in the present unsatisfactory mode of barter, till the fortunes and the indifference of the consumer undergo a drastic change, for we use as good a system, buy to as good advantage and sell as cheaply as our customers will allow. Nearly all up-to-date storekeepers allow a 5 per cent. discount for cash sales, either in money or trade slips. Personally we give a money discount, which is the most satisfactory. That should be sufficient inducement to pay cash even though one must borrow it. It is ridiculous to assert "a cash customer should not help pay for interest on investment and bookkeeping." He must also pay for rent, heating, lighting, clerks, insurance, depreciation, etc. If the people will take a broad view of the situation they will see that when everything is taken into consideration, such as convenient mode of paying, etc., they are getting just as good value for their money in the long run as when they send to the city. R. C. WOOD.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Pole Attachment for Spraying.

THE picture shown at Fig. 491, page 1123, was taken in a melon field in South Jersey, and shows an attachment for spraying the vines when the melons have reached fair size. It is often necessary to spray quite late in the season in order to save the crop either from disease or plant lice. In such cases there is frequently more harm than good done by driving through with a heavy sprayer with a narrow attachment at the side, as the horses and the wheels of the sprayer break down the vines and crush the fruit. To avoid this trouble some of the South Jersey growers use such a device as is shown in the picture. Here as we see the sprayer is driven through the field, and a good hose attached, with a pole fastened so that a wide stretch may be covered by the nozzle, and thus the sprayer can be driven on some central track through the field without great injury to the vine, while the long hose and the pole may be used, if need be, on either side, or around the sprayer, so as to cover a wide space at each stand of the machine. Certainly when we think of the old days when crude work was done by hand pumping, we realize what great progress has been made during recent years in doctoring our crops.

Burning Bones.

IN a recent issue of the *Country Gentleman* some reader asks about handling bones for fertilizer. He is told to burn them and the following statement is thrown in.

"They are then brittle and easy to crush fine. Burning destroys the organic matter of bones, which includes some nitrogen, but since this nitrogen in raw bones is not available, its loss is not important. The phosphorus is unchanged, being calcium phosphate both before and after burning. Its availability is probably about half that of acid phosphate, if the phosphoric acid of each is compared pound for pound."

What do you think of this advice? It is contrary to my experience and study.

J. L.

We showed this to our expert manufacturing chemist and he said:

"Great Scott! Such bones contain about three per cent. of nitrogen worth at least $3 per unit! Yet this man would have the farmer throw all that away."

Not only does burning drive off the nitrogen, but the phosphoric acid in bone ash is less available than in ground bone. In raw ground bone about one-third of the phosphoric acid is available while in bone ash the proportion is but little over 10 per cent. The softer bones can be buried beside trees or vines with profit. Packing the bones in barrels or boxes between layers of wood ashes—the whole thing to be kept moist with stable liquids, will soften most bones in about three months so they can be crushed with a spade or sledge. Burning is resorted to in some cases, but it is a wasteful plan and should not be advised without reserve.

Prices for Grimm Alfalfa Seed.

I NOTE, on page 1054, your comment on Grimm Alfalfa, and the statement that this seed can probably be bought this year at from 25 to 75 cents per pound. I try to keep in close touch with anything pertaining to Alfalfa, and have just returned from a trip through the West looking the matter up. I assure you that you can probably buy seed that will be called Grimm at 25 cents, some of it may be Grimm and most of it may not. I question at this writing whether any pure seed of this variety will be sold even at wholesale this year as low as 25 cents, 50 cents would be more like it, and I happen to know that one of the largest and most reliable growers recently priced around a carload to the government at 60 cents wholesale. I venture the statement that there will probably be between four and 10 times as much Grimm sold this year as was produced, and I would be extremely suspicious of any lot that was offered for anywhere around 25 cents. I make this suggestion to you merely because I know your feeling for honesty and fair play, and feared that somebody might misunderstand your statement and bite on some of the very low-priced seed which will unquestionably be offered. CHAS. B. WING.

Ohio.

R. N.-Y.—The statement which we printed came from the Department of Agriculture. There can be no doubt about the folly of biting at the bait of low prices for seeds.

Vetch or Crimson Clover With Rye.

I HAVE a five-acre field of oat stubble that I am plowing for rye, to be cut for hay next Spring and then plowed for silage corn. I have been thinking of sowing a mixture of one peck Winter vetch to eight pecks rye. Would this be enough vetch, and would the returns justify the expense of more seed at $6 per bushel? Would Crimson clover have any value as a substitute for vetch? I have been offered air-slaked lime at the kiln at half price. This had been accumulating for some length of time. Would this be a profitable investment? W. P. B.

Quarryville, Pa.

We consider it too late to sow Winter vetch in your latitude after the 10th of September. In our own latitude we should want to sow the vetch by the middle of August in order to obtain its best yield. It is much the same with Crimson clover. Either crop seeded so late will not be likely to appear in the Spring, especially if the Winter is an open one with the ground unprotected by snow. Of the two we should expect rather better results the first year of seeding from the Crimson clover at this late date. Vetch does not usually start well on the first trial without inoculation. With a long Fall, open and fairly moist, there would be a large Fall growth of the clover, which will more than pay the cost of labor and seed. In our own case this year with a late seeding in the corn, we have left out vetch and clover and used equal parts of Cow-horn turnips and Dwarf Essex rape with the rye. Farmers must remember that if they expect to get the most out of their cover crop, they must sow it early. Rye is about the only crop which will stand a late seeding. If the lime you speak of is reasonably fine so that it can be spread fairly well, it ought to make a good bargain at half price.

Cover Crops in Garden.

IN the matter of cover crops, you recommend clover, rye and turnips. The small area of my garden precludes the use of a plow and I am wondering if in spading operations a growth of rye or turnips could be conveniently turned under. Would it not be better in a small garden to confine cover crops to lower growing material like clover, and if so, is there anything that could be sown with or in substitution of clover? E. A. B.

New York.

This is a good suggestion. A large plow is required to put a full rye crop under. We have known cases where the rye was cut with a scythe, wilted on the ground, and then spaded under. Barley or oats can be seeded in place of the rye. These grains will make a good Fall growth, but will be killed during the Winter and the mat which they leave on the ground can be spaded under in Spring. The main consideration is to have some rank-growing crop on the soil during the Fall. Hairy vetch would be the best substitute for clover if it is spaded early in Spring—before it gets too large.

Killed the Peach Trees.

IN the Spring I wrote you and also the Connecticut Experiment Station about a remedy for peach tree borers. The station suggested the use of arsenate of lead, painting the trees around the ground line with it. We did this and, of course, that was all right, but a week later we put a handful of nitrate of soda around trees and hoed it in. A week after applying nitrate I saw a good many trees dying, and couldn't find the trouble, so called up the Experiment Station and asked them to send a man up to look at them. They examined them and said that the chemical action of the nitrate on the arsenate of lead had drawn the true arsenate out and burned the tree. As we have lost fully 40 per cent. of trees we call it a dear lesson, and have put this on file: Never use arsenate of lead in or near nitrate on a peach or apple tree. R. B. OWEN.

Connecticut.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

EXTRA GOOD PEAR TREES AT A FAIR PRICE

Men who have visited my nursery say that the Pear trees are the "finest ever." The trunks are big and clean. I've kept a cultivator going all summer and the trees and roots show the results. You will go a long ways before you find such trees. I have all the best sorts — Duchess, Bartlett, Anjou, Keiffer, Seckel, and others — ready to ship at the right time.

4 to 5 feet . . . $25 per hundred
5 feet and over . . 30 per hundred

Tell me when you expect to plant — fall or spring — and let me reserve some of these trees. A copy of *Fraser's Tree Book* will be sent free if you ask for it.

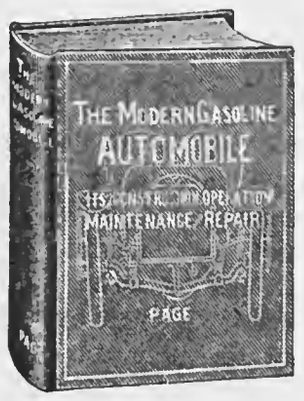
MODERN GASOLINE AUTOMOBILE.
Its construction, operation, maintenance and repairs. By Victor W. Page. 6 x 9. Cl. 693 pp. Over 400 ills.



It gives up-to-date information on the construction, care and operation of the gasoline automobile, including breakdowns, and troubles of every description, with their proper remedy. The book is clearly and concisely written, and tells just what to do and how to do it under all circumstances. Every illustration in the book has been specially drawn by the author, and shows details of every part of the machine.

This book will be sent to any address prepaid for

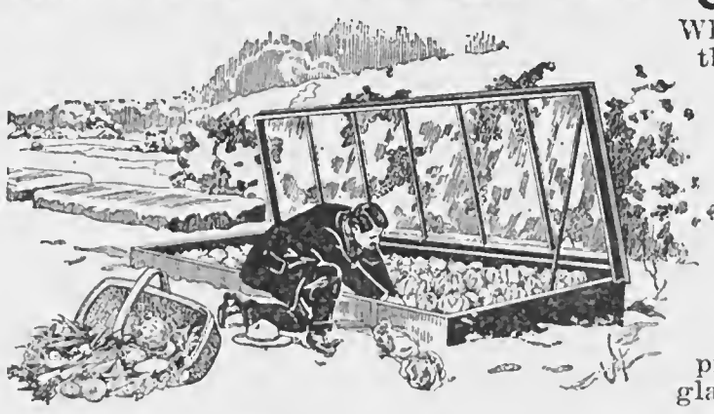
Continue Your Gardening All Winter



Why be satisfied with only the few months of summer harvest from your garden when you can enjoy "seeing things grow" throughout the cold and dreary winter months? Lutton's Miniature Glass Gardens provide the means. You'll find a great deal of pleasure and a full measure of profit in gardening under glass.

To meet the popular demand, we manufacture a special sash and frame 8 ft. 4 in. long and just wide enough to put in a three foot space on the south side of the house. A child can ventilate the frame with ease.

Price complete, ready to put together. Freight prepaid anywhere in U. S. Double glazed $1.00 extra. **$10.50**

Prompt shipment guaranteed. Planting instructions sent with each frame. We manufacture regular 2, 3 and 4 sash frames, single and double glazed. Our catalog also illustrates our new portable greenhouse. Write for it today.

WHAT TO DO WITH YOUNG CLOVER.

ONE of our readers says he has a new seeding of clover this year, which has made quite a heavy growth. He wants to know what he can do with it to get the most out of it. Should he clip it and leave the clippings on the ground for a mulch, let it alone just as it is, or turn in the stock for a pasture? This man is located in Tioga Co., New York. Will you give your own practice in handling the clover crop?

If feed is as high and pasturage as short up in Tioga County as it is here in Orange, I would lose no time in converting it into milk. You do not say whether this clover is in bloom or not. If in bloom, I would take a mowing machine, and after the dew has disappeared, mow enough every other day for four feeds, rake up and draw in after two in the afternoon. I find my cattle relish Alfalfa and clover much more after the sun wilts it, and it also makes the idea of cutting every other day more practical. Give one-half ration the first feeding, and if the supply is plentiful, all they will eat up clean twice a day thereafter. Not later than September 10 cut all that remains, and cure in cocks in the field, using as wanted, and taken to the barn when dry should any remain at that period.

Assuming it will not mature to the point of blooming, but has made a luxuriant growth, turn the cows in one-half hour the first day, an hour the second and all day thereafter, until they have hogged it off to a length of two inches above the ground. This will leave some stubble for protection through the Winter. In soiling with Alfalfa and clover I am between cuttings, confronted with intervals when some other entertainment must be provided. I have prepared a piece of ground with a convenient barway leading into the road, which will be sown with rye this Fall; one part with a full seeding, the remainder lightly, which in the Spring will be sown to oats and peas.

When the rye is cut a coat of manuring will be applied, and a heavy earing variety of sweet corn will be planted on the ground. It is not profitable to buy feed to make milk in the Summer time. A variety of soiling crops to eke out the supply of clover and Alfalfa will keep down the feed bill. It is a very pleasant feeling on a hot day in a dry time to know one's cattle have access to water, and a good liberal feed of green fodder awaiting them in the barn. GEO. E. HOWELL.

New York.

WESTERN NEW YORK HORTICULTURAL HAPPENINGS.

SCALE DISAPPEARING.—Evidently in this section the scale, after having wiped out many apple and pear orchards, and seriously damaged thousands of apple, pear and other trees in orchards still standing as such, has received a sudden check, and some of the once infested trees are gradually recovering, and show only slight infestation now. This I report about trees that have not been sprayed at all, or at least not regularly or thoroughly. I am not in the situation, however, to tell for a certainty what is the real cause, whether atmospheric (Winter's cold, etc.) or the newly discovered parasite. I first noted the gradual disappearance of the dreaded pest last year. The San José scale may have been of untold benefit to the fruit-growing industry as a business; but we would not mourn over its disappearance as a serious factor in fruit production. Insects come, and insects go. This is shown in several other instances.

THE BLACK SQUASH BUG.—A dozen or 15 years ago the black squash bug was present every season in large numbers, and compelled us to watch the pumpkin, squash and similar vines persistently, and hunt up the ill-smelling depredator every few days. In the Fall the late broods would often by hundreds of young bugs cover the vines and fruits, and I have often sprayed the vines, after the fruits were gathered, with kerosene, covered them with a little straw and set fire to it, thus destroying the young bugs with the vines. Then came an unusually severe Winter, and not a bug was seen for years. Even now I only find an occasional one in Winter quarters, in some crack or crevice, or hidden under some rubbish, and we have not suffered any loss or inconvenience from this pest for years.

POTATO AND FLEA BEETLE.—That "insects come and insects go" is also shown in the practical disappearance of the potato beetle this season, and of the negligible number of flea beetles that we found on all our garden crops and potatoes this year. The cause of the potato bug's non-appearance must be climatic or atmospheric. I have seen none of the natural insect enemies of the potato beetle in unusual numbers this year; in fact, there were but few. The potato beetles simply failed to show up. I have patches of potatoes in my grounds here and there, some planted earlier and some later, but in some of these patches not a single potato beetle could be found, and in only one or two a few of the less vigorous plants were attacked by the usually so numerous beetles and somewhat injured. All these patches were close to or even on the identical spots were potatoes had been grown last year, when potato bugs were more plentiful. I did not have to use any poison this year.

THE UNEVEN BARTLETT CROP.—The Bartlett pear has the reputation of being self-sterile. In this county this pear is often found in solid blocks, or planted singly far away from other pear trees. Yet in most years every tree seems to bear a full crop. The present is one of the years when we have a partial failure. Some trees have no fruit at all; others have a few, and still others bear a full crop. In previous seasons of partial Bartlett failure I have observed that the Bartlett trees standing not far from other pear varieties, such as Duchesse (Angouleme), Clapp's Favorite, Seckel, Sheldon, etc., were the ones that had the most and best pears, while the lone trees, and the trees standing outside of the influence of the other varieties, were mostly wholly barren, or had only few and crippled, lop-sided specimens. As a rule, this is true again this year; but occasionally we come across a lone tree, or trees, standing at considerable distance from other varieties, which are well set with fruit. Some of such happenings are not so easily explained. However, if I were to set a new orchard of Bartlett pears, I would feel a good deal safer, even, in this blessed Bartlett pear section, if a few Duchesse, Seckel, Clapp, Anjou, Sheldon, etc., were set intermixed with the Bartletts.

WATER IN THE GARDEN.—A little water used in the garden may often be the turning point of failure to success. On July 31 I sowed two little patches of Silverskin and other onions for green or bunching onions (for early Spring). The ground was rather dry, as it frequently is at that time of the year. In one of these patches water was applied from the village water works, by means of ¾-inch hose and a good lawn sprinkler, for nearly a day, under a pressure of about 60 pounds, and the sprinkling device moved every two hours or so. This gave the upper two or three inches of the soil a fairly good wetting. A rod or two at one end of the patch was left without watering. The plants came up promptly in a little over a week's time, except on the end not reached by the sprinkler. Rains came at about this time, making the ground plenty wet enough. But it has taken nearly three weeks' time for the young onion plants at the end, as also in the other patch that had no water (being too far from the supply) to break ground and show enough to admit the use of the wheel hoe. In the meantime, in this patch, the weeds have taken such a start that it is uphill work to get them out of the rows, and we may even be forced to give up the job if weather should continue wet. People living in the suburbs of cities and villages, who have a little garden, and a ready supply of water under pressure of thirty or more pounds from a near tap, have an opportunity for garden making which few of them fully appreciate. It is water that makes the garden grow, of course, with due applications of plant foods. But with irrigation it is often possible to grow on a quarter acre what an acre would not produce without it. Plan to make full use of the water when you have the chance!

T. GREINER.

Galvanized or Painted Roofing

Made of high grade open hearth metal. All galvanized Roofing and Siding have an extra heavy tight coating of galvanize. Write today for free sample and mill price list No. 204. Send size of building, length of ridge, length of rafters and we will furnish free complete estimate of cost--without obligation on your part to buy--then make comparison and see the big saving. Also makers of galvanized shingles for houses.

30 Year Guaranteed Galvanized Roofing

Made of selected best grade No. 24 gauge open hearth metal with DOUBLE COATING of GALVANIZE and PURE TIN. Write today for price list No. 60. When you buy from us you buy from the manufacturer.

Established 1877

THE SYKES METAL LATH & ROOFING CO.
516 Walnut Street, Niles, Ohio

DIRECT FROM MILL AT MILL PRICES

FIX THAT LEAKY ROOF NOW!!

Don't let the rain drip in and spoil everything.

Conkey's LEAK-FIX PUTTY

seals every crack and cranny in any kind of roof on any kind of building. Always pliable. Gives and takes with the weather. Stops leaks for good. Special offer 10-lb. Can $1.00, order today. We pay expressage. G. E. CONKEY CO.

103 Conkey Bldg., • Cleveland, O.

COMPLETE WATER TOWER OUTFIT ONLY $49

500 Gallon Cypress Tank and 20 foot Steel Tower, as shown in cut. Other sizes equally cheap.

Tank guaranteed for five years. Same outfit on credit at slightly higher price. Complete Water Works equipment. Better get our catalogue today, and our New Way Selling Plan No. 25 free.

THE BALTIMORE CO., Baltimore, Md.

$1250 will buy this superb car

The high quality, low cost car of the year—light weight—accessible—extremely flexible—and with the exclusive "Bate two-unit, three point Suspension Construction."

Read These Remarkable Features:

- Chrome Vanadium Steel Construction
- Long Stroke, High-Speed L-Head Motor
- Three-point Motor Suspension
- Full Floating Rear Axle
- Two-unit—Three-point Construction
- Vacuum Gasoline Feed
- Silent Electric Starter
- Electric Lights
- Silent Chain Drive Shaft to Generator and Distributor
- Positive Helical Gear Drive to Cam Shaft
- Water Pump on Fan Shaft
- Dimming Search Lights — Non-Glare System
- Electric Horn
- Speedometer
- Gasoline Gauge
- Mitchell Power Tire Pump
- One-Man Top
- Integral Rain Vision Two-Piece Windshield
- Quick-Action Side Curtains
- Crowned Fenders
- Portable Exploring Lamp
- Demountable Rims
- Extra Tire Carrier in Rear
- License Brackets

This is the new Mitchell 1915 Light Four. A snappy — smart — long rakish car—Crown fenders—new sloping Cowl and curved hood — flush doors with disappearing hinges.

A car that looks like $2000 worth for $1250.

There's more Chrome Vanadium Steel the lightest and the toughest metal known used in the construction of this car than in any other of like size and Power.

Light Weight But Safety First

That's one reason why it is such a light car.

Then Steel Stampings and drop forgings instead of heavy metal castings have been used wherever possible.

Will underweigh cars of similar size and power from 400 to 1000 pounds. And yet it's a rough country car — and absolutely safe — it will keep the road.

Bate Two-Unit Construction

The most efficient Construction in the world for Creating Power and for turning Power into mileage.

The Three-point Suspension Construction anticipates the twists, jars and bumps of rough country going — saves the car—saves repairs — reduces Upkeep Costs and keeps the tire and gasoline bill to a minimum. And because of the simplicity of the design every part is *accessible*—

The Personal Touch

See this car for yourself — ask our dealer to demonstrate it for you — drive it yourself — feel the thrill of the wheel get the Personal Touch.

Then remember the features you see —the advantage you experience are *there to stay*—

Write for literature and demonstration information. Address Dept. 121

The Mitchell Line for 1915

EVENTS OF THE WEEK.

DOMESTIC.—Flames swept through two buildings of the Lister Agricultural Chemical Company on the Passaic River at Newark, N. J., Sept. 2, entailing a loss estimated at $100,000.

The Women's Coöperating Farming Community, near Morristown, N. J., received a blow, Sept. 3, when its promoter, Edward Hart of 106 West Seventy-ninth Street, New York, was arraigned in the Yorkville police court on a charge of getting money under false pretences. The complaint was made by Miss Mary Keelan of 164 West Ninety-eighth Street and her sister Elizabeth, who said in July of last year they gave Hart $750 for three acres of land on which they were to raise mushrooms. He told them, they said, that he had purchased 1,000 acres from Dr. Duncan Dobie of Morristown and would sell the land in lots of three and six acres to New York women who wanted to get back to country life. After paying their money and not being able to get a deed for the land, they said, they learned that Hart did not own the land.

Newark, N. J., opened its municipal fish markets, Sept. 3, under the auspices of Mayor Jacob Haussling in an effort to force down the price to consumers. They did a rushing business. Markets were established in three of the most populous districts of the city and were manned by city employes. Porgies, weakfish, lafayette, fluke, flounder and small bluefish were all at the flat rate of six cents a pound. The markets will be open every Thursday and Friday.

A decrease of more than $7,000,000 in the duties collected in the New York district for the month of August, as compared with the same month last year, is shown in figures now available at the Custom House. While the war has cut heavily into the revenues, the new tariff also has had much to do with the reduction. The effect of the war is shown clearly, however, in a comparison of the revenues of July and August of this year, the decrease in August having been approximately $3,000,000. The severe cut is shown in tangible form by a comparison of the withdrawals from warehouses. The duties collected from this source in July were $4,516,630. In August they jumped to $6,077,429. The New York district includes the custom houses at Albany, Newark and Perth Amboy. The decrease in customs receipts for the eight months ended August 31 is approximately $10,000,000. The big decrease in August, however, indicates that the war has played havoc with our revenues, far more than the new tariff, which, of course, is also responsible for a part of the decrease.

The first ship to carry a cargo through the Panama Canal, the Nebraskan, of the American-Hawaiian Line, laden with California fruit and wines, came into port at New York, Sept. 8, and was welcomed by Acting Mayor McAneny and other city officials as California's officially designated pioneer ship of the new transisthmian trade. The voyage was made in 27 days.

The United States government has taken charge of the radio station at Tuckerton, N. J., and messages will be received from all belligerent and neutral stations.

More than 450 men were thrown out of employment at Paterson, N. J., Sept. 8, when fire destroyed the plant of the East Jersey Pipe Company, entailing a loss of between $250,000 and $300,000.

September 10 Dr. M. S. Borden of New York and three other persons were killed near Palermo, N. J., when their automobile was struck by a freight train at a railway crossing, a fifth person being badly hurt. The car was traveling at high speed when hit. Two months ago Dr. Borden, when running his car in Greater New York ran down and killed a mounted policeman.

Orders received, Sept. 9, by General Pershing, commanding American troops on the American border at El Paso, Tex., to lift the embargo on arms to Mexico will, in the opinion of army men, mean the withdrawal from the border of the United States patrol. The lifting of the embargo is regarded as a victory for Villa.

Two expeditions have gone in search of the missing thirty men of the Karluk, Stefansson's vessel, which was wrecked in the Arctic Ocean on September 4, 1913. The United States revenue cutter Bear has started from Nome on her second attempt to reach Wrangel Island, where the sailors are believed to be marooned. The second boat, the Corwin, has been chartered for the trip by Jafet Lindenberg, the founder of Nome, and a personal friend of Stefansson. This is the last rush before the Winter ice closes in. The Mary Sadio left Herschel Island on August 11 for Banks Land to establish depots for Stefansson, should he succeed in landing there from his floating island of ice.

The United States Steel Corporation, through the Steel Produce Company, its export subsidiary, applied, Sept. 9, to have 10 vessels flying the British flag transferred to American registry. At the same time the United Fruit Company took the first step for the transfer of 25 of its ships from various flags by applying for incorporation papers for each ship at Albany.

THE EUROPEAN WAR.—Paris was declared in a state of siege September 3; the Bank of France had then sent specie and securities to Bordeaux. Rheims was then occupied by the Germans. An enormous battle, extending over a line of 150 miles, was in progress Sept. 5-11. Sept. 8 the Allies began to drive the Germans back, and Sept. 11 they had retreated about 37 miles, the Allies taking a strong offensive movement. It was then believed Paris was out of danger. .....It was asserted Sept. 9 that Emperor William had sent a dispatch to President Wilson in which he protests against the participation of the Belgian people in the war, and expresses deep regret at the destruction of interesting places in that country. He makes a strong protest against the alleged use by the French of dumdum bullets. The belief is held in Washington that this is merely an opening wedge for an effort on the part of the Germans to bring about peace. The British Foreign Office has already stated that it will not consider any peace terms that do not include full indemnity for all injury suffered by Belgium.....September 8 Ghent surrendered to the Germans, to avoid bombardment. It was then reported that the Germans had destroyed the ancient city of Dinant. At Termonde the Belgians inflicted a loss of 5,000 upon the Germans. It is said that indemnities to the total of $140,560,000 have already been demanded by the Germans from the towns and districts they have occupied in Belgium. The demands are as follows: Brussels, $40,000,000; Liege, $10,000,000; Louvain, $20,000; Province of Brabant, $90,000,000; Lille, $140,000; Amiens, $200,000; Roubaix and Turcoing, $200,000. A number of less important towns have also been fined various small sums.....The Austrian defeat at Lemberg, which ended a three days' battle was followed by the flight of three army corps, with enormous loss of men and equipments. September 7 the Russians took possession of the Province of Galicia and Russian victories were reported at several points.....September 4 Premier Asquith announced that between 250,000 and 300,000 men had responded to Lord Kitchener's call for recruits.....September 5 a convention between France, Russia and England was signed at London, by which it was agreed that no one of these powers should agree to peace with Germany unless all three agreed to it. Later Japan united in this agreement.....The British cruiser Pathfinder was blown up by a torpedo off the coast of Scotland September 4, with a loss of 248.....September 4 the Wilson line steamer Runo, from Hull, for Russian ports with passengers, struck a mine in the North Sea; 26 passengers were lost, but more than 300 were rescued by British fishermen.....Vessels arriving at Manila bring reports indicating that Philippine waters are being constantly patrolled by British, French, Russian and Japanese warships to intercept German merchantmen. The Hampshire is west of Luzon, a Russian cruiser with seven destroyers is patrolling to the north, while the French armored cruisers Kleber and Dupleix are to the southward, and the Japanese warships are off San Barnardino. .....Sept. 8 the British battleship Glory arrived at Halifax, N. S., convoying the Spanish steamer Montserrat, which was seized on the high seas with 150 German reservists on board. The Montserrat had sailed from New York two days before.....Since the war began 16 English fishing vessels from Grimsby have been sunk in the North Sea. Many trawlers are now engaged in collecting floating mines, for which the Admiralty pays them about $10 apiece. .....Accompanying the 30,000 soldiers from British India now in France are a number of Indian potentates; the Maharajah of Mysore has contributed to British war funds 50 laks of rupees. The Dalai Lama of Tibet has offered 1,000 soldiers.....Sept. 9 the Holland-America liner Noordam, from New York with German reservists and a general cargo for Germany, was captured by a British vessel and taken to Queenstown..... Great Britain is preparing to receive 60,000 homeless Belgians, chiefly women and children but also men unfit for military service. Special boats are being sent to Ostend for them, and 52 towns and cities are ready to receive them. Many of these people, who are entirely destitute, will be taken into the homes of charitable people.

WASHINGTON.—The first definite results of the Federal Government's crusade against alleged conspiracies to manipulate food prices came Sept. 4, when 31 persons, including well-known provision and commission merchants of Washington, were indicted by the Grand Jury on a charge of unlawfully engaging in a combination in restraint of trade in violation of the Sherman anti-trust law. It is charged that they had daily meetings at which the prices which they paid for farm products were fixed and that they obtained a monopoly of the local market in foodstuffs, which permitted the members of the alleged conspiracy to fix arbitrary and excessive prices.

President Wilson submitted a plan, Sept. 7, for a three years truce to all parties in the Colorado mining strike. This action by the President will again necessitate a decision by the Rockefeller interests as to whether or not they will make concessions in the vital principles involved in the strike. The President points out that there are important public interests involved in the existing controversy aside from those of the two contending parties. The plan he submits was evolved by two representatives of the Government who have studied the issues in the strike for several months with a view to finding a solution. The plan contemplates establishment of a truce for three years, during which the State mining and labor laws shall be enforced, and the restoration to employment of all striking miners who have not been found guilty of violation of the laws. Intimidation of non-union or union men is to be prohibited and wage scales are to be posted at each mine. A grievance committee is to be chosen by the employees of each mine, which shall be entrusted with treating with the employer when trouble arises. A commission of three, to be appointed by the President, is to be the appeal body to which grievances that cannot be otherwise settled are to be taken.

The Merchant Marine Committee reported to the House, Sept. 8, the administration bill for the creation of a government controlled corporation to purchase or build ships to enter the foreign shipping trade while traffic is demoralized because of the European War. The report puts at rest fears that the neutrality of this country may be violated by a government operated steamship line, and assurance is given that the proposed shipping board to control the project, with the advice of the President and State Department, will avoid international pitfalls.

An outline of the new taxation was given September 8, this is to provide for falling revenues due in part to the European War. It contemplates increased rates on beer, wine and spirits, and a probable tax on Pullman tickets, gasoline, playing cards and cigarettes.

CROP REPORTS.

Sept. 1. Conditions here are good. It has been a fat year, and good prospects are ahead. The hay crop is 150% or better, both in yield and quality. Some of my neighbors with stump meadows actually ceased making hay because they lacked barn storage. Oats are poor, but are grown mainly as a nurse crop, and the new seedings are fine. Other grains are fair. Corn is about 80 to 85%, but is slow maturing. Pastures have been good all Summer, and cattle have done well and are in good condition. Farmers will carry over more stock than ever before with better feed for them. Prices are good, the best grade Jerseys being quoted $90 to $110, with good ones at $65 to $85. Beef prices control the rest.
Irma, Wis. G. G. C.

Sept. 4.—Wheat, $1.08; oats, 43; corn, 80; rye, 80; barley, 70; clover seed, $9.25; Timothy seed, $2; steers, 8; cows, 4 to 6; calves, 9 to 10; hogs, 8½; lambs, 5 to 7; sheep, 3 to 4; a little more for extra good stuff. Hay, Timothy, $12; mixed, $11; clover, $10; straw, no demand. Potatoes, 75 to 90c.; spring chicken, 14; eggs, 21; butter, 22 to 30 and none to be had. I never saw country butter so scarce; pasture is good, but both country stores and those in the city are selling creamery butter. H. H.
New Haven, Ind.

Sept. 3. Prevailing prices which a farmer could obtain on following commodities at this point are as follows: Wheat 90; oats 40; shelled corn 68; ear corn 65; barley 52; hogs $8.60; fat cattle nine cents. Butter, country made, 25; creamery 30; eggs 18; grapes four cents pound; tomatoes $1 bushel; potatoes 75; wild hay $8.50; Alfalfa hay $11. In addition to above we have regular gardeners who canvass the town daily, selling cabbage, melons, carrots, etc., but our supply in that line is very limited, and prices fluctuate. W. A.
Tekamah, Nebr.

The principal crops grown in Kern County are fruit, grain, hay and Alfalfa. The prices this year are away below cost of raising it, and at the price there is no sale for it. A neighbor of mine was offered $8 per ton for fine wheat hay, $4 per ton for Alfalfa, on the car. Out of that there would be $2 for baling, $1 for hauling and 25 cents for siding charges. Good cows sell at $80 to $125. Horses are cheaper than they were on account of so many autos in use. Chickens, old and young, any size, 16 cents live weight. Creamery butter 30; ranch butter 20; eggs 20 to the farmer at the store.
Bakersfield, Cal. G. A. H.

Sept. 1. Peaches are a total failure in Monroe County, N. Y. One grower congratulates himself on having 400 baskets where he should have had from 4,000 to 6,000 in an ordinary year. Apples are heavy crop; Bartlett pears about 20% of a crop, and other kinds about 75% of a crop. Grapes will be a heavy crop. The Rochester market consumes nearly all grown in the county, and the anticipated price is two to 2½ cents the pound. Tomatoes are selling for 20 cents the basket, apples from 25 to 50 cents the bushel, melons from 75 cents to $1 the dozen, and potatoes about 80 cents the bushel. Corn is good but a little late. Oats were good but damaged by weather. It was the poorest time in the history of the county to care for the crop. Wheat is a good crop, hay fair, and the farmers are holding it for higher prices, with indications of the prices reaching $15 or $16 a ton. Last year the best was sold for $11. W. J.

"Do you always acknowledge it when you know you are wrong?" "No; only when other people know it."—Boston Transcript.

Studebaker

The Report Is True—Here Are The Prices

UNDOUBTEDLY—along with the whole country—you have been amazed at the prices for the new Studebaker car—$985 for a big, roomy touring car and $1385 for a Studebaker "Six."

These would be extraordinary prices for just a "good" car.

What, then, can be said of these prices for a Studebaker car?

What, then, can be said of these prices when they carry with them the Studebaker name, the Studebaker reputation, the Studebaker character, the Studebaker guarantee—and Studebaker Quality?

It is too little to say they are extraordinary.

We believe these prices with Studebaker Quality are unprecedented.

Our fathers and grandfathers know the name Studebaker. For sixty-two years it has meant American vehicles, honestly, sturdily made. For sixty-two years farm and city homes have known Studebaker as the name for dollar-for-dollar value.

These sixty-two years Studebaker has grown enormously—in reputation, in production, in prosperity.

Today Studebaker means—in city and country—the acme of elegance as well as the acme of money-worth.

Today we give Studebaker owners and Studebaker buyers the benefit of sixty-five years of Studebaker growth.

That growth has made possible Studebaker Quality at Studebaker prices—and has made them possible for these reasons:

First, there is the huge volume of Studebaker production.

During the last eighteen months 55,000 Studebaker cars have been manufactured and sold.

This is the largest number of cars of one make, selling at or above the Studebaker price, ever produced in the same period by any manufacturer.

Second, Studebaker cars are manufactured cars—manufactured in the Studebaker plants.

Studebaker motors, springs, bodies, tops, drop forgings are made in Studebaker plants.

Special formulae for Studebaker steels are worked out and the steels are tested and analyzed in Studebaker laboratories, probably the largest and most completely equipped in the motor car industry.

Studebaker gears, axle-shafts, front axles, all vital parts are manufactured and hea treated in Studebaker plants.

Studebaker, we believe, manufactures a larger proportion of motor car parts than does any other motor car producer in this country.

The completeness of Studebaker manufacture of Studebaker cars means better, stronger, longer wearing materials—consequently Studebaker Quality.

But in addition, it means the saving of the parts-maker's profit, the waste and extravagance of the "assembled" or semi-manufactured car.

And that, in turn, means the economies that make possible Studebaker prices.

The volume of Studebaker production and the completeness of Studebaker manufacture mean the Quality and the Profit that go back into the Studebaker car you buy.

The Studebaker has the double distinction—Unique in Quality and Unique in Price.

The Studebaker Car of 1915 is an impressive example of what square-dealing, good building and right-thinking among the American people can do in sixty-five years.

Today the American people in town and country "Buy it Because It's a Studebaker."

The Studebaker Corporation of America
105 Piquette Ave., Detroit, Mich.

Specifications

The New SIX—5-Passenger and 7-Passenger

Electric Starter, Electric Lights.
Two body styles: Five-Passenger and Seven-Passenger Touring.
Wheelbase—121 inches.
Long-Stroke (5-inch), Small-Bore (3½-inch) Motor; Six Cylinders, en Bloc.
Special Dimming Headlights.
Smokeless, Non-Leaking Lubrication System.
New Exhaust-Silencing Muffler.
Annular Piston Rings.
Cellular Radiator.
Crowned Fenders.
15 x 2½ in. brakes.
34 x 4-in. Goodrich Tires on Q. D. Demonntable Rims; Safety Tread on Rear.
Extra Rim and Locking Tire Carrier.
Roomier Front and Rear Compartments.
Continuous Aluminum Footboard.
One-Man Type Top.
Built-in Rain and Clear Vision Ventilating Windshield, Attaching Rigidly to Top.
Scientific Anti-Rumble Gasoline Tank in Cowl.
Magnetic, Non-Leaking Gasoline Gauge, the only One Approved by Insurance Underwriters.
Full Floating Rear Axle, Shaft Locking into Taper at Hub. Timken Bearings.
Full Equipment of 13 Timken Roller Bearings.
Irreversible Steering Gear.
Inter-Locking Ignition and Lighting Switches.
20 Operations in Painting Bodies.

The New FOUR Roadster and Touring Car

Electric Starter, Electric Lights.
Two Body Styles: Five-Passenger Touring; Three-Passenger Roadster.
Wheelbase—108 inches.
Long-Stroke (5-inch), Small Bore (3½-inch) Motor; Four Cylinders, en Bloc, Exhaust Manifold Cast Separate.
Smokeless, Non-Leaking Lubrication System.
Special Dimming Headlights.
Pressed Steel Push-Rods.
Annular Piston Rings.
Tubular Radiator with Auxiliary Water Tank.
Crowned Fenders.
12 x 2½-in. Brakes.
Hot-Jacketed Schebler Carburetor Bolted to Cylinders.
Magnetic, Non-Leaking Gasoline Gauge, the Only One Approved by Insurance Underwriters.
Generous Footroom in Both Compartments.
33 x 4-in. Goodrich Tires on Q. D. Demountable Rims; Safety Tread on Rear.
One-Man Type Top.
Built-in Rain and Clear Vision Ventilating Windshield, Attaching Rigidly to Top.
Full Floating Rear Axle, Shaft Locking into Taper at Hub. Timken Bearings.
Full Equipment of 13 Timken Roller Bearings.
Irreversible Steering Gear.
Flush Dash Equipment.
Extra Rim and Locking Tire Carrier.
20 Operations in Painting Bodies.

NEW YORK STATE FAIR NOTES.

MACHINERY.—The gasoline engine, the motor truck, the litter carrier, the manure spreader, the milking machine, the riding plow and the tractor attracted the business farmer at the fair at Syracuse this year. The farmer is becoming a mechanic, and his appreciation of machinery in lightening his tasks would have astonished the mechanician of a score years ago. Farm machinery is as keenly an interesting feature of the fair as the horse race and the live stock. The exhibits evidence what farmers are buying. The silo men declare there were one-third more inquiries for silos than last year. The prospects were more interested than heretofore, and the indications point to the sale of one-third more silos the coming year than heretofore in the State. The tractor for a score years was considered at home in the West. One tractor representative declared fruit men are more deeply interested in the machine for orchard tilling, farmers in this power for hauling, road men for grading, and the side hill orchards of New York and New England will apply the tractor to their farm work on nearly 40 per cent. increase in number of machines in use. Farmers are turning attention to the use of concrete on the farm. The old back-breaking method of mixing cement with hoe, and pouring in water from a pail and shoveling the mixture in a bucket is yielding to the concrete mixer. The machines are inexpensive, compared with efficiency, and several were shown which could be operated by hand or the small horsepower engine and cost about $35.

"Now is the age of gasoline," a farmer remarked as he observed a display in which there were a half dozen engines in operation. "There will be more engines sold in the East than heretofore," remarked a representative. "In the dairy sections we are placing the large horsepower engine, 10, 12 and even larger for silo filling. Many farmers are buying smaller engines for pumping and household work." "We are adding the magneto to our engine and the low price of gasoline and fuel has quickened the demand for power plants." The patent right promoter has disappeared from the fairs and is no longer offering a new "fence idea." The wire men are telling the New York farmers the secret of fencing. The farmers are not buying barbed wire as they did a dozen years ago. The farmer who is seeking good fencing finds No. 9 wire is the fencing which is most profitable, the increased life is a sensible investment, and the critical buyers are asking for fencing with stay wires spaced six inches apart. The fence men will sell nearly double the fencing in New York State the coming year. We must provide more sanitary milk and do it profitably, dairymen agree, and the milking machine is a means of sanitary milk production. Four different milking machines were exhibited at the State Fair.

POULTRY EXHIBITS.—The grandeur of display and the comfortable quarters in which the poultry is located are the features of the poultry exhibit at the State Fair, in the opinion of one of the visitors and exhibitors. The practical as well as show stock is the kind that were exhibited at the fair. Exhibitors not only from New York State, but from Canada and as far west as Kansas battled for prizes. The Rhode Island Reds were more numerous than heretofore. This is an evidence of their popularity as a serviceable fowl. Leghorns have been popular at the New York State Fair, and they have maintained their stand in spite of other birds bidding for popular favor on the basis of efficiency. The varieties, even including the more rare Silver Duckling Leghorn were shown, and all in good numbers. The Anconas and the Campines deserved recommendation. There are not as many Barred Rocks exhibited as previously. This was probably due to the lack of the get-together spirit among the breeders. Special inducements were offered the Minoreas, and the breeders responded by sending remarkable fowls. The popularity of the Anconas and Campines as egg machines was evidenced by the numerous exhibits. These birds not only are the kind which will satisfy the egg producer but the fancy breeder. The array of the Campines was declared the best outside of any great city show. The presence of the Sicilian Buttercups evidenced their being a practical and efficient bird. Turkeys were shy this year, the only breed shown being White Hollands. The special prizes on Indian Runner ducks stimulated very lively competition among breeders in New York and surrounding States. Among the geese Toulouse and Embden, and a large number of Africans were shown. Even the migratory wild goose had been made to feel at home, and evidenced pride in the attention given him. A multitude of bantams which came from far west Kansas, were at home among their many competitors, and although some attempt showing efficiency in bantams, yet the number of exhibits show interest of fanciers in the small fowl, as show and pet bird. "The Minorcas have nothing over the Leghorns in size of egg," remarked one poultryman as he leaned over the railing, and inspected the eggs shown. The egg exhibit was one of the interesting little features of the show.

VEGETABLE AND FRUIT EXHIBITS.

IN view of activity of the Vegetable Growers' Association during the past Winter, in which it was decided to bring to the attention of the Fair Association the need of improvement in existing conditions, Henry Greffrath, a large commercial grower, was appointed superintendent, and the premium list was doubled. The prizes, particularly in onions, potatoes, tomatoes, and other vegetables, were secured by commercial growers rather than fanciers. The Grange and the county exhibits had fallen off in the past two years. This is due to the effort required to collect material for these exhibits. It was suggested that men should be hired to collect these county exhibits, they should be paid, and should visit orchards with the view to selecting fruit for exhibition purposes. Others proposed that the Granges should hold preliminary fairs and from the winning exhibits, the county exhibits should be selected for the State Fair. In fruit, prizes were offered to packs, and it was suggested that much of the fruit shown would be in boxes and baskets and barrels, and the plate displays would be left to the Granges. In the volume of the exhibits, owing to the peach shortage, the peaches shown were less than previous years. There are more apples being shown than last year, and about the same number as two years before. The grape exhibits are the best shown in several years. Many prizes were awarded the Hudson Valley and Long Island grapes, because of their being well advanced in maturity compared with the western and the lake vineyards.

LEGAL FARM MATTERS

Private Water Supply.

HOW long can a lease be obtained in this State for putting a reservoir for water on a hill above the house, and could I supply my neighbors with the running water and fix our rates without the permission of some other official? Whose property would the pipe be that ran from the reservoir to my place if I paid for the installing of it in the beginning? D. M.

The right you desire in the spring would be more in the form of an easement than a lease, but if you wish to lease the right to get water from the spring, the term could be for any length of time you wish. The lease should also contain the provision for carrying the water over your neighbor's property. Unless you protected your right in the pipe by contract, it would revert to the owner of the property on which it was laid after your lease expired. You can supply your neighbors up to the number of 10 with the running water and fix your rates without the permission of any public official, but if it got over this number you probably would have to consult the Public Service Commission.

Payment of Taxes.

A PURCHASED a farm in New Hampshire for $800, paying one-half down and securing a mortgage for $400 from B, the first owner of the farm. A agrees to pay B $100 down each year at the rate of 6% on the $400. A claims that as long as the rate of interest is 6% he has no taxes to pay and that B is obliged to pay the taxes, but if the rate of interest were 5%, A would have to pay the taxes. D. M.

New Hampshire.

The rate of interest has nothing to do with the taxes. The taxes must be paid by the party who has the legal title to the land. If A has been given a deed and he has recorded it, he must pay the taxes, unless by contract A and B have decided otherwise.

Damages for Change of Grade of Railway.

OUR buildings are situated on the lower side of the highway and are so situated that we have quite a steep incline to drive up to get into the highway. Now the State authorities are building an improved highway which cause a fill in front of our driveway and house of some eight to 10 feet which makes it impossible to drive on to road or make a reasonable drive in the old place. We have had to move our road fence and drive along parallel with road for some distance before we can get on. It is quite a damage to us as a matter of convenience, and more so if we were to sell off farm. It is considered a very serious damage by the best men of this community; some have estimated the damage around $1,000. Are you of the opinion that I could get damage from the State? Is there any law protecting people in this respect? R. S. H.

New York.

Section 59 of the State Highway Law, which does not seem to have been amended lately, provides that in any town in which a town highway shall be repaired or graded from curb to curb by the authorities of the town the owner of the land adjacent to the State highway shall be entitled to recover from the town the damages resulting from any change of grade. This claim should be verified and presented to the town board within 60 days after such change of grade is effected. The town board may agree with the owner upon the amount of damages, but if no agreement is made within 30 days the property owner may apply to the Supreme Court.

Wait! Don't Buy Any Storm Buggy Until You've Read My Offer

D. T. Bohon

Don't waste your money paying double profit on high priced buggies. I save you $25 to $50—factory price—and send you my luxurious storm buggy on 30-day road test. Unlimited guarantee backed by $30,000 Bond.

I have saved thousands of dollars for farmers and will save you money. Get my new proposition now.

Bohon's Famous "Blue Grass" Storm Buggy, Built for Hard Knocks

All gear parts and braces Norway wrought iron and steel. Wheels are STRAIGHT GRAIN SECOND GROWTH HICKORY. Body and seat are air-dried yellow poplar. Water-proof roof. Warp-proof doors. Double strength glass in windows and doors. Easy riding; light running.

FREE Bohon's Foot Warmer Write for Details Today

Extra zero driving comfort. Costs you nothing. You don't even have to buy a buggy. Full particulars together with my big Buggy Bargain Book sent on request. The supply of free foot warmers is limited. Write at once.

TILE DRAINED LAND IS MORE PRODUCTIVE

Carries off surplus water. Increases the value of your land. Acres of swampy land reclaimed and made fertile by using JACKSON'S DRAIN TILE. We are producers of Albany Blue Slip Clay, Hollow Brick and Blocks. Dealers in Sewer Pipe, Flue Lining, Fire Brick and Chimney Tops. Send for catalog and prices. John H. Jackson Tile Co., Inc., 89 Third Ave., Albany, N. Y.

Drain Your Land In an Instant!

Do it cheaply, quickly and easily at half the cost of hand work. Turn those flooded fields and swampy places into dry, fertile land that will give you big crops. In a fraction of a second you can dig a perfect drainage ditch, smooth at sides and bottom. No experience necessary. Punch a row of holes, load, fire, and blast as much ditch as 20 men could dig in a day.

Atlas Farm Powder
THE SAFEST EXPLOSIVE
The Original Farm Powder

is made especially for farm use, and is sold by dealers near you. It is the cheapest farmhand you can hire for ditching, blasting stumps and boulders, and tree planting. Farmers everywhere use it to save time, money and labor.

By using Atlas Farm Powder to break up the subsoil, you can insure your crops against drouth and release rich stores of plant food that will give you increased harvests. Subsoil blasting pays big profits. It makes the land worth more.

Valuable Book, "BETTER FARMING," Free

Our new illustrated book, "Better Farming," shows how to increase the fertility of the soil, protect crops from drouth, make your land more valuable, and increase farm profits by using Atlas Farm Powder, the Safest Explosive. Mail the coupon and get it FREE.

VAN DEMAN'S FRUIT NOTES.

Dying Apple Trees.

WILL you tell me what ails my apple trees? They are old Bellflower trees; the leaves turn yellow and drop off and the limbs seem to be dead. I have sawed a lot of limbs out but more are going the same way. L. F.
Eastport, Me.

There might be one or more of many troubles affecting these apple trees. It may be old age and starvation. There may be canker on the branches or borers at the base of the trunks. It would be a mere guess to say what is the real cause of the trouble. The surest way to know is to look over the trees carefully for borers and canker and if there are any of the former there, dig them out at once. If there are diseased places on the branches, cut out sections and send to the experiment station at Orono for examination by the experts there. It will cost nothing but the mailing charges. There is far too little use made of these advantages that are afforded by the experiment stations.

Walnut Blight.

I HAVE charge of English walnut grove of 11 acres, 18 years old. It has borne a few nuts. Trees are affected with some kind of blight, leaves turning yellow and edges curling, and about this time of year dropping and leaving about one to two feet of dead wood. I would like some information in regard to treatment. Situated one-half mile from Lake Erie, gravel soil and very fertile, cultivated up to August 1. W. M. J.
North East, Pa.

Walnut blight is a disease similar to pear blight and has a distinct bacterial germ that is the cause. It is very prevalent in many of the walnut orchards of California and has done a great deal of damage, not only to the foliage and young wood, but to the nuts. There is great difficulty in stopping this disease. Spraying in the most thorough manner has proved about useless in the California orchards. Cutting out every sign of it as soon as seen is the way to fight the disease. It may be that it is not blight in this case, but the description is quite clear to me of the truth of its presence. I would send specimens to the State Experiment Station and to the U. S. Department of Agriculture for examination.

Fall Pruning of Peaches.

I HAVE a lot of peach trees planted in the Spring of 1912. They have made a fine growth this Summer, and are in a very thrifty condition. I have been advised to cut back this year's growth somewhat to encourage fruit buds. Would it be good practive, and would September be the proper time? J. K.
Detroit, Mich.

It is very likely that some cutting back of these peach trees would be a benefit to them but this should not be done until next Spring after all the severe freezing is over. To cut them back or prune them in any way this Fall would be wrong. It is too late to have any effect whatever in the formation of fruit buds, for they were set in the early part of the Summer, and are now all ready to develop next Spring into bloom. They are always on the new growth, and are usually very abundant on trees three years from time of planting. It will be well to cut back the branches that are very strong and show a tendency to make the trees too tall and spreading for convenient gathering of the fruit. Some of the branches may need to be taken out entirely to prevent too dense a growth. An evenly balanced and rather compact head open enough for good light on all parts of it is the ideal, in my opinion. Do not remove the small interior branches for they will bear good fruit. Don't prune to clean shanky main branches.

Barren Plum Trees.

I HAVE about 50 Burbank plum trees that do not bear. Most of them are in henyards. They are eight years old and have never borne a full crop. They are all handsome spreading trees, and I keep them sprayed and looking fine. They are loaded with masses of fruit buds every Winter, but drop off in the Spring. The other plums, such as Red June and Abundance, that are planted beside them, bear very heavily. Is there anything I can do to make them bear? I have never pruned them much. They grow so handsome they don't seem to need it.
Billerica, Mass. F. S. M.

It is not a common failing of the Burbank plum to be unproductive from failing to set its fruit or dropping it afterwards, except in cases where rot is very bad. The flowers are generally considered self-fertile. It is possible that the inquirer is mistaken in the trees that he has, and that they are some other variety than Burbank. It is quite easy to distingnish the trees of the Burbank plum from about all others that I know because of the peculiar spreading habit. The branches are very vigorous and grow horizontally to a considerable degree, making a tree of distinct shape. Most of the trees of the Japanese species are quite upright in habit and some of them are remarkably so. I know of nothing to advise for making these trees productive unless it is to top-graft them to some variety of the same class that is known to bear well in that region.

H. E. VAN DEMAN.

THE WAR AND SEEDS AND BULBS.

IT may seem strange at this time to learn that even one commodity is not going up on account of the existing chaos in Europe, but on the contrary has taken a big drop in price, about 25%.

Holland produces a large share of the Winter flowering bulbs, tulips, hyacinths, Narcissi, etc., and the crop is now harvested and ready for export. The warring countries of Europe are looked to by Holland to consume two-thirds at least of the annual output, and this market is now closed. United States takes one-sixth and other countries one-sixth. Holland must now look to us and the other neutral countries to care for the two-thirds now in her warerooms. The effect of this was shown last week in a florist trade paper where prices on all such bulbs were quoted from 25% to 50% below ordinary rates—if deliveries can be made, which remains to be seen. Florists hope the bulbs will come through all right, as it will work something of a hardship on them not to have this staple flowering article for Winter sales, as potted, blooming bulbs are one of the good sources of income to them in the Winter and Spring months.

Seed harvests of European countries either ripe or nearly so. Most of the great seed producing countries are those now at war, Germany being one of the greatest, what is known as the Quedlinburg and Erfurt districts producing almost unbelievable quantities of seed annually. Only women, children and men above 45 years are left to harvest, sort, pack and ship this crop, and when ready it is doubtful if it can be gotten out of the country.

The United States is said to produce about $1,500,000 of the annual consumption of some $18,000,000 worth of seed, the balance coming from abroad, and some $15,000,000 from the countries now closed to commerce. If the war should continue four months and over, the seed proposition for farmer and gardener would assume a very serious aspect, not only on account of price, but extreme scarcity. Some of the kinds coming from Europe in large amounts are beet, carrot, cucumber, cabbage, cauliflower, chard, mangel and flower seeds, with practically everything else in more or less large amounts.
Michigan. P. L. W.

Howard E. Coffin's Crowning Six

The new HUDSON Six-40 holds first place today because Howard E. Coffin designed it.

He is final authority on motor car engineering. For many years he has led the most important advances. Most men today will concede his supremacy.

This car is his masterpiece. He has worked for four years on it, with 47 other HUDSON engineers. And this latest Six-40 is their final conception of the ideal new-day Six.

The Typical Car

The HUDSON Six-40 is simply the climax of an almost universal trend. It shows the goal which the ablest designers are aiming at today.

HUDSON Six-40 $1,550 This Year f.o.b. Detroit

Most cars are being built lighter. But the HUDSON Six-40 is the first car of similar passenger and road capacity to reach 2,890 pounds.

All seek lower operative cost. —by a new-type motor—we have accomplished economy before unknown. In body beauty we have simply excelled along the lines in vogue. So also in equipment, comfort and convenience. We have added unique attractions.

And HUDSON efficiency has distanced others in the trend toward lower prices. This $1,550 is a record price on a quality car of this size.

The End of Excess

This HUDSON Six-40 marks the end of over-tax—of excess in weight, in price or operative cost. Such excess means crudity. It means wrong materials, or lack of skill, or low efficiency. Such things have no place in modern engineering.

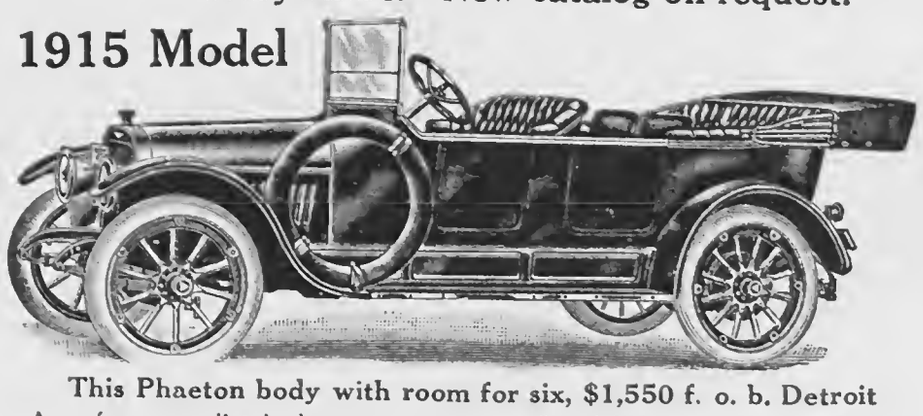
Men have come to Sixes to get continuous power. Now they are coming to lightness, to fuel economy, to artistic lines and perfect equipment. And they are demanding lower prices.

In the HUDSON Six-40 these requirements are met as in no other car of today. They are met in a car built by Howard E. Coffin, which means the last word in a quality car.

Those are the reasons why you should see this car. Its perfections will amaze you. No car in this class, in the history of motoring, has ever met such a welcome.

Hudson dealers and service stations are everywhere. New catalog on request.

1915 Model



This Phaeton body with room for six, $1,550 f. o. b. Detroit

A perfect streamline body.
Disappearing tonneau seats.
Invisible hinges—hand-buffed leather upholstery.
Gasoline tank in dash. Tires carried ahead of front door.
"One-Man" top with quick-adjusting curtains attached.
Dimming searchlights.
Simplified starting, lighting and ignition system.
Wiring in metal conduits.
Locked ignition and lights.
New speedometer drive.
Automatic spark advance.
New-method carburetion.
Five styles of body.

(200)

Hudson Motor Car Company, 8235 Jefferson Ave., Detroit, Mich.

Hope Farm Notes

AT the New York State Fair you meet all sorts of people—most of them with a message. This message is a condensed report of what life has taught them during the past year. If you question them a little you will obtain a clear statement of the best thought of agricultural New York. I talked with many farmers this year, and what follows may be accepted as a fair statement of what they are considering.

ALFALFA.—All along the limestone soils in Central New York Alfalfa is working out farm miracles. Wherever its culture becomes general all crops improve, land values rise, incomes increase and prosperity mellows the farmer and makes his life happier and better. It looks as if Holstein cattle follow the Alfalfa. Some of the sections where this crop does well have become famous for the production of black and white cattle. A few years ago when I said that an acre of Alfalfa in central New York was like a free ticket at a mill for four tons of wheat bran some people called it a wild statement. History has proved it true—and more.

SELLING HAY.—Most of the arguments for growing Alfalfa are based on the plan of feeding the crop to dairy cows at home. There is another side to this. Our old friend Hamlet Worker of Onondaga County sells the hay. Mr. Worker was formerly in the dairy business, but sold his cows. He has 35 acres or more of Alfalfa which this year will give four to five tons of hay per acre. This will average $16 or more per ton. Perhaps two months of labor are required to handle the crops. In that country a field well started in Alfalfa will last eight years or more—perhaps 25 cuttings. Mr. Worker has tried lime and phosphate on the Alfalfa, but could not see any improvement where they were used. The strong soil of that section grows more and more productive as the result of growing Alfalfa and plowing under its sod.

OTHER CONSIDERATION.—It was the universal comment that Alfalfa growing increased all crops and enlarged business. One man said that 12 years ago he had one mower, one horse rake, and pitched all the hay by hand. Now as a result of Alfalfa growing he has three mowers, several rakes, hay loaders, hay slings and a gasoline engine to lift the hay into the barn. With this improved machinery a boy could do the work of at least two strong men working with the old-time tools. There were men from certain sections of the State who had tried Alfalfa and failed. It might do fairly well one year, but then it faded away. The soil was not naturally adapted to it—being very shallow or wet, with a hardpan. The lime supply was too far away and freight rates too high. These and other reasons made Alfalfa too short-lived or too expensive. It is quite a problem with these men whether they shall try to overcome the natural soil difficulties or give up Alfalfa and try crops which are better suited to sour soils. Certainly the man on an Alfalfa soil has a great advantage.

MOTOR TRUCKS.—Farmers are studying the transportation question as never before. Grant Hitchings, the apple man with the mulched orchards, tells me he has about 25,000 bushels this year. I went out to the Hitchings orchard years ago when the crop was less than 1,000 bushels and all the experts laughed at the plan. For years Mr. Hitchings hauled his fruit in a wagon over the hills to Syracuse—the load averaging perhaps 30 bushels. Now he has an auto truck which will take 105 bushels at a load and probably go in less than half the time the horses took. These horses are left at home for farm work. All over the State farmers are studying this transportation problem. Many of the larger farmers and fruit growers have auto trucks for road work, while in some cases several farmers combine and organize a trucking service.

AUTOMOBILES.—It is astonishing how many farmers own and drive their cars. I heard a conversation between two farmers—one middle-aged—the other older. The younger man said that 75 per cent. of the farmers in his section owned cars.

"Did they mortgage their farms?" asked the older man.

"No They are well-to-do farmers who have paid for their farms and have a surplus!"

"What good does the car do them?"

"Well, they see more of life! They have worked hard and deserve an easier time. They can take the women folks and get out around 50 miles from home and see old friends and make new ones Most of them did not buy these cars for business, but for social and mental benefit. Life looks better to them through the power of getting away from home—and back again quickly."

"They better save their money!"

"The money belongs to them and they figure that it is better for them to have some enjoyment out of it. Why should they not use their money for such a purpose instead of leaving it for their children to quarrel over? Most boys would be far better off if their parents used the fruits of their own labor to make their lives more enjoyable."

"Down our way when a man buys an auto he neglects his farm!"

"That is not so with us. As the farmer gets out more and sees how others are doing he studies new ways and new crops, and take more pride in keeping things up. Then he learns more about markets and prices and the value of things and he comes to be a better business man."

"But he may neglect his home!"

"I do not think so. One trouble with the telephone was that it was keeping people too much at home. When you can call up the neighbor and talk to them over the wire you do not feel so much inclined to go out to meetings where people gather. The same was true of rural mail delivery. People quit going to town, where they could talk to their friends and visit. The auto car comes to mix people up and get them together where they can learn what is going on."

GASOLINE ENGINES.—They are working in everywhere and doing all kinds of work. The little engines are used to some extent on potato diggers or manure spreaders to work the machinery so that the horses have only the weight of the implement to haul. Thousands of these little engines are going into the house to serve as "tireless hired girls," where they run the churn, the washing machine, cleaner and a dozen other things which formerly demanded the best or the worst of hand and back. Farmers also told about putting heating and water fixtures into their houses. More of this is being done than ever before. I am sure there never was a time before when thrifty farmers were doing more and spending their money more freely to make themselves comfortable and save the women folks.

OLD-TIME FARMER.—One of the Syracuse papers stated that the old-time, or real farmer, has disappeared. It could not find a man "chewing straw and with overalls tucked into his boots" and therefore claimed there were no longer any "farmers." The fact is you could not pick the farmers from the town people by any external evidence. To prove this, Frank Rupert, one of the fruit judges, approached a group of well-dressed men and asked each one if he was a farmer. They were all farmers, not one having any other business. They were dressed just like town business men, talked even more intelligently, carried themselves in a dignified way, and gave just as good a business impression. A dozen things may be said to have led up to this, but the thing most responsible for it is the fact that farmers are reading and thinking more than ever before. They have learned that a large proportion of the people *eat with their eyes*—that is, select the fruit or other food that "looks nice." They also find that the world is inclined to give men place in society by the way they look and act. This may not always be fair, but the farmers find it a fact, and as they mix up more and more with other people they learn how to pass with the best business people, and you cannot separate them. Who will say that this is not a desirable thing?

THE WAR.—People discuss it intelligently—that is they do not pretend to know just what it is about, but they have a clear idea of its effect upon this nation. It is a sobering effect, for these farmers fear that out of it may come a weakened faith in the real power of democracy. It may mean a demand for a U. S. standing army of half a million or more, with military drill for every man! The general fear is that so long as there are autocratic military governments in the world the peaceful nations are at their mercy. The man who goes about his peaceful business—no matter how large and strong he may be—would always be at a disadvantage beside his prizefighting neighbor who spent most of his time training to fight while his wife and the boys supported the family. That is what these intelligent farmers feel may be the comparison between the successful insolent military power and a peaceful democracy! In a business way our farmers, except for the fruit growers, are very optimistic over the future. They argue that six or eight million men in Europe are taken from food production or manufacturing. There is never a year's supply on hand—usually not over six months. If the war continues it seems clear to our farmers that America must be expected to feed and clothe the fighting nations. The farmers expect to get their share of what this demand means and they are preparing to get it through organization. This general feeling that the export trade will be adjusted so as to help the home demand makes farmers on the whole more hopeful for the future than I have known them in some years. It is a fact that what we call "good times" will depend as much upon spirit and hope as upon actual production and sale.

FRUIT AND VEGETABLES.—Evidently the production of these crops is growing like a snowball in New York State. As Rochester was once the flour city and is now the city of flowers, so in New York State, horticulture is now coming to the head. It is not generally known that several counties in Western New York are richer and more prosperous than any other fruit counties in this country or in Europe. There is even greater wealth in several sections where vegetables are grown. The Hudson Valley too is growing beautiful fruit. The Clintondale Grange of Ulster County won first prize for their fruit collection, and it certainly was a fine display. Then Long Island is coming as an apple section. Peter Elbert Nostrand, the man who put Long Island on the fruit map, was at the fair with a fine display. The grain farmers and the dairymen are doing great things, and they show well in the figures with Alfalfa to help them, but with each decade all suitable land within 150 miles of the Atlantic must go more and more into intensive culture of fruits and vegetables. There can be no escape from this. Eastern land must increase in value in proportion as it is suited to producing food. No man can afford to practice low-class methods on high-priced land. None but the wealthy can ever keep "boarders" in crops or animals. In fact the entire lesson from the State Fair this year is one of good cheer. A young man with a piece of land never had a better opportunity.

H. W. C.

EVERY year we have a good many questions from readers who ask about the culture of flax. It would seem as if many of our people are interested in this crop. For the benefit of these inquirers we will say that the North Dakota Experiment Station has issued a bulletin on "Flax Cropping and Harvesting Methods." This gives an excellent story of the way flax is grown in North Dakota, particularly with regard to methods of harvesting the crop and taking care of the seed. It is an excellent pamphlet, well illustrated, and gives just the information that so many of our people have called for.

Waterman's Ideal Fountain Pen

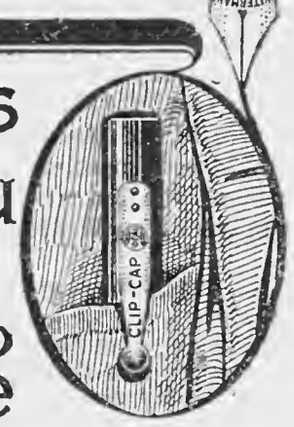
For any writing you have to do either out or indoors, Waterman's Ideal will make it easier. The smallest size will write about 20,000 words with one ink filling, and will always start to write the instant the pen touches the paper. The entire pen is strong and safe to carry. One Waterman's Ideal will last for many years. Saves not only time but money and makes better writing. There is also a Safety Type for women.

Every pen stamped Waterman's Ideal is guaranteed to give satisfaction. Gold points furnished to suit every hand. Prices $2.50 to $50.00. Illustrated booklet on request

Sold at the best stores in most all cities and towns.

L. E. Waterman Company
173 Broadway, New York

Always With You Ready to Use



Then you won't spend money pulling out the one that failed.

We make over 300 types of pumps—one for every purpose. Tell us what you need a pump for, and we will suggest the type that will serve you best. Write Mr. Gould, care of our Consultation Department. His advice is free. It may save you many dollars and days of wasted time.

GOULDS RELIABLE PUMPS

We specialize on pumps. Our big 70-acre factory turns out more pumps than any other concern in the country. And this multiplied output means greater efficiency and a lower cost to you. Before you buy any pump, look up the Goulds dealer in your town.

Write for Free Book

A little volume of pointers on "Water Supply for the Country Home," illustrated with pictures and diagrams. Tells how to have running water on the farm. Send for it. (27)

GARDEN NOTES FROM NORTHERN OHIO.

RADISHES AFTER BEETS AND CARROTS.—The following questions come to me from a gardener near Cleveland, Ohio:

"I have often read of radishes being a companion crop with beets and carrots. How would they be for a succession crop? Would they become affected with club-root if the beets and carrots were not?"

In answer I should say no, on general principles, but I have not had any experience with club-root, as I have bought very little manure, and having plenty of land have not been obliged to crop the same ground continuously. This inquiring gardener has the means of obtaining first hand information in unlimited quantity if he goes on to the Cleveland market. In the Akron market, which I attend, more than 100 gardeners may be found at 3 A. M., and they get together in small groups and hold very interesting experience meetings. There are a few who have short memories and forget the names of vegetables they market and the seedsman they bought from, as well as time of sowing, but as a rule gardeners answer questions freely and honestly and seem anxious to help their fellows.

THE IDLE HOTBED.—I presume there are 50,000 hotbeds owned by rural readers which have not been thought of from a business standpoint since about the middle of June. Some paid their way no doubt, but all are loafing at present, whether they paid or did not. Now is the time to get busy with these and the cold frames as well. Pull out the weeds, loosen up the soil, add a little rich compost well mixed in, and then spank down until the soil is compact. Mark off some rows six inches apart with the edge of a thin board, and sow with the earliest button forcing radish. Then mark off more rows four inches apart and sow to the Early Curled (Silesian lettuce of some catalogs). Do not sow very much of the radishes, as they do not thrive as well as lettuce under Autumn conditions. If the bed is a large one part of the lettuce sown may be of the Grand Rapids variety. As soon as large enough the lettuce should be thinned for eating, and if properly managed the Grand Rapids will continue until Christmas or later, according to the exposure and latitude. The sash should be put on at sowing and shaded until the plants are well started, when the glass may be taken off and left off until it is needed to keep up a growing temperature. In the latitude north of Philadelphia the sashes may be kept on after September 25 without injury, giving very free ventilation in warm sunny days.

L. B. PIERCE.

White Fly; Potting Hydrangea.

IS there anything that will control the small white fly in greenhouses? It is troublesome on plants, especially on Pelargoniums, Verbenas, tomatoes and eggplants. They are fairly covered with them. 2. What is the best time to repot Hydranges hortensis? J. M. L.
Long Island.

The most effective remedy for greenhouse white fly is fumigation with hydrocyanic acid gas. Some benefit is derived from spraying with whale-oil soap, 1½ ounce to one gallon of water. While hydrocyanic acid gas is a certain remedy for this pest, and also for mealy-bug and violet aphis, it should never be used except with all possible care and precaution. The gas is a deadly poison to man as well as to insects, and we have heard at least one report of the death of a florist who did not understand the deadly nature of the insecticide. The materials used are cyanide of potassium, sulphuric acid and water, in the proportion of one ounce 98 per cent. cyanide, two ounces commercial sulphuric acid and four ounces of water. Put the water in a good-sized crock, pour the acid in slowly, stirring the mixture. Never pour the water into the acid, or dangerous spattering, which may be fatal to eyesight, will result. Place the proper amount of cyanide in a paper bag and suspend the bag over the crock with a string so arranged that it may be lowered into the fluid from the door just as the operator goes out. The reason for this is the sudden and deadly flow of the gas; in the one greenhouse fatality reported the operator put the cyanide in the liquid and then started to walk to the door, but was overcome before he reached it. Of course all ventilators are closed. The exact amount of poison for a greenhouse must be ascertained by trial; much depends on the tightness of the house, while some plants are injuriously affected by the gas. It is advised by Prof. O'Kane to begin with one-fourth to one-half ounce of cyanide to 1,000 cubic feet. Keep the house closed for two hours, then open and air, and note results. If the plants are uninjured and the insects not all killed, a little stronger application may be used. Do the fumigation at night, when leaf surfaces are dry; airing may be done the same night, or early the next morning. Do not enter the house to open ventilators until open doors have liberated gas; enter cautiously, and never forget the dangerous nature of this fumigation. 2. Young plants of Hydrangea hortensis for Easter blooming, from cuttings taken in February and March, are repotted in eight-inch pots the end of September, kept shaded until established, then exposed to sun. Older plants, that have been kept dormant through the Winter, are repotted in Spring, the old growth being cut back to one or two pairs of buds.

Pruning Cane Fruits.

I HAVE just bought a suburban home where the former owner has set out blackberries, red raspberries, black raspberries and strawberries. When should I trim out the old canes; that is, those that had fruit on this year? The grass has become a sod in between the rows. Should I plow this up this Fall or wait till Spring? How may I start young black raspberry roots? In the blackberries, young shoots have come up all over and they are a solid mass. Should I cut out those in between the rows now or in the Spring? A. B.
McGraw, N. Y.

The old canes that have fruited this year should be removed as soon after fruiting as possible. This permits the young shoots to get the full benefit of air and sunshine, and stronger canes for next year's fruiting will be the result. I would plow the old sod that has come in between the rows of plants this Fall, after growth has stopped. The action of frost and weather this Winter will help to break it up and make it more workable next Spring. Any shoots left after plowing can be cut out this Winter. It would also be an advantage to cut out all weeds and sod in the row of plants. This can be done in late Fall or early Spring. If the material is available, a mulch of straw or strawy manure along the rows of plants, covering the space between the row and the cultivated area, will be quite an aid in holding moisture and keeping down weeds.

Black-cap raspberries are grown mostly from root-tips. When the cane reaches a certain stage in its growth it is bent over and covered with a little soil. If necessary a stone is put on it to hold it in place. In order to get the best plants there should be at least six weeks of growing weather after the tip of the cane is laid down. These rooted tips can be cut from the old cane next Spring and if desired they can be put in a nursery row in order to obtain additional size and vigor before being set out in the permanent plantation. Such plants are known as "transplants." TRUCKER, JR.

Preparing Catnip for Market.

WILL you tell me how to prepare catnip for the market? I have raised a large quantity and would like to know how to prepare it for sale. What part is used, is it just blossoms, or blossoms and leaves? Are any small stems allowed, and what are the size and weight of the package? F. A. H.
Pomfret, Vt.

Catnip and similar herbs for market purposes, are cut, when in full bloom, high enough above the soil to avoid most of the coarse, bare lower stems, and after partially curing in the swath, the drying is finished in an airy shed or loft in order to retain the natural green color as far as possible. When thoroughly dry, the herb is best pressed in bales of 100 to 200 pounds weigh. If in smaller quantity, it may be tightly pressed in burlap sacks or ventilated boxes. In packing throw out all coarse and bare stems, retaining only the leafy shoots and blooms. Dried herbs keep and travel best when tightly pressed, but with provision for ample ventilation. The prices received by growers for catnip usually range from three to five cents the pound. V.

These nails prove why your roofs should be of ARMCO Iron

Rust has eaten up the round steel nail. The wrought iron nail is still good, although three times as old.

The reason for the superiority of the wrought iron nail is that the iron in it is practically pure. It is impurities that hasten rust.

Apply this lesson of the nails to your roofing, and roof your buildings with Armco Iron.

ARMCO IRON Resists Rust

Armco Iron has been, and still is, widely known as American Ingot Iron. Armco Iron is purer, hence more rust-resisting than the iron in the nail or the iron in the good old-fashioned tin roofs that are still good after seventy years or more of rain, sun and snow.

Armco Galvanizing Protects

Armco Roofing has galvanizing that protects it much more than galvanizing can ordinary sheet metals.

American Ingot Iron, because of its purity, shows practically no dissolution when the zinc is applied. Therefore, the coating of zinc is purer than the galvanizing on ordinary iron and steel.

How to get Armco Iron

You can get Armco Iron products from your hardware store or your tinner. If you have difficulty in getting Armco Iron, write to us for names of manufacturers and dealers who handle it.

The trade mark ARMCO carries the assurance that iron bearing that mark is manufactured by The American Rolling Mill Co. with the skill, intelligence and fidelity associated with its products, and, hence, can be depended upon to possess in the highest degree the merit claimed for it. It has behind it the guarantee of that company concerning the purity of the iron and the accuracy and thoroughness with which each step in its manufacture has been conducted.

Valuable Books FREE

Get our Free book, *"Iron Roofs that Resist Rust."* Tells all about American Ingot Iron Roofing. There are a dozen styles or more—corrugated, flat sheet, roll, V-crimp, black sheet, shingles—single or in cluster, galvanized or terne plate, etc. When you have selected the roof you want, your dealer can get it for you. The Armco trade mark—as shown below—is stenciled on every sheet of American Ingot Iron roofing.

Armco Iron is used in stoves and ranges, furnaces and refrigerators, silos and water tanks, culverts, flumes, wire fences—wherever rust-resisting iron is needed. All these uses are told about in our book—*"A Journey to Armco Farm."* We will gladly send it free with our roofing booklet if you care for better, rust-resisting metal articles.

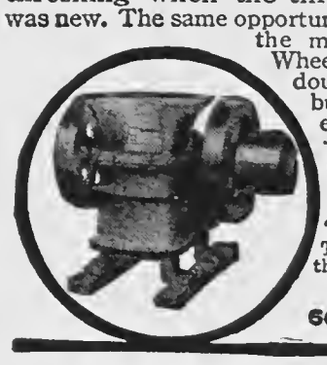
There's Money In Crushing Limestone For Others

A WHEELING LIME STONE CRUSHER "BUILT LIKE A BATTLESHIP" WILL MAKE IT FOR YOU

Get into the crushing business. Remember the fortunes that were made in threshing when the threshing machine was new. The same opportunity exists today for the man who owns a Wheeling Crusher. Lime doubles crops—costs but little, crushed with a Wheeling—cheapest and surest soil food.



Our No. 2 enables you to start small. Add capacity as you grow. Impossible with other crushers. Crushes any size—equally good for concrete, road work or liming. Your engine will run it. Built of steel—like a battleship—not cast iron. Light and EASY running. SIZES FOR EVERY CRUSHING CONDITION. GET FULL PARTICULARS.

Write for This Book

"Mixing Brains with Farming." *Free on Request.* Tells all about crushing profits and why a Wheeling, built by the pioneers in the business, does best work.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.01, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

IN all this talk about cover crops we have tried to make it clear that vetch and Crimson clover must be seeded early if we expect them to pay. Some of our readers north of New York are even now getting ready to seed these crops. They are too late. Our advice is to use rye alone at this late season. Rape and turnips may, even now, make a profitable growth before Winter, but the sure crop now is rye. We regret to see people try vetch and Crimson clover so late in the season and then condemn them for failure.

*

THERE is no question about the bad mix-up in many lots of potatoes supposed to be Irish Cobbler. This popular variety is often so badly adulterated that when the true Cobblers are ready to dig, there is a good proportion of late varieties left in the field unripe and unprofitable. Another variety badly mixed is Rural New-Yorker. This has been mixed with Green Mountain so that it is difficult to find the pure seed. Growers do not want to abandon these fine varieties, but they will be forced to do so unless some one can guarantee pure seed and live up to the guarantee.

*

THERE were 2,200 automobiles in one day on the State Fair grounds at Syracuse. This indicates New York farmers' prosperity, and that the machine is becoming a necessity in rural life. It was thought that the parking space would be sufficient to care for the machines, but on Grange day the overflow was sent to the infield at the race track. The larger part of these machines belonged to farmers who came distances ranging from few to many miles. These machines placed the State Fair grounds in the limits of a pleasant drive, whereas with the family horse and carriage even the trip to the railroad would have been more irksome. Every machine owner is also a booster for better New York roads.

*

AS we have stated already, the U. S. Pomologist at Washington will identify fruit varieties if samples are sent him. Growers in New Jersey may send fruit samples to the State Experiment Station, where they will be identified free of charge. Address Prof. M. A. Blake, New Brunswick, N. J. It is very important to have varieties properly named. Peach varieties in particular are badly mixed up. In one trial orchard, planted by the New Jersey Experiment Station, six so-called distinct varieties are all alike. Evidently these are "misfits"—six different labels fitted to the same kind of a tree! This work of identification is very important. It costs nothing but a little time.

*

OUR readers are making good use of their education in advertising. One of those concerns offering "humus" for sale, sent their confidential circulars to one of our people. This is part of what they got back:

Your favor to hand inclosing printed form letter and catalogue, offering us 35% discount on cash orders. Before taking up with same desire to know what is the analysis of your fertilizer, how much available plant food it contains, also as to the class of periodicals carrying your advertisements, as thus far they have not been brought to my attention in the farm papers we take.

Those people charge $20 for a ton of "humus"—probably dried swamp muck worth about $2.50 per ton. This farmer has a swamp on his farm, lime within easy reach and acres of rye to be plowed under. Think of offering an intelligent man with such an outfit, "humus" at $20 a ton and the chance to fake his neighbors by taking a commission of $7! But this farmer wants to be shown the class of publications which print such offers! That is getting to be the final acid test, for any paper that will print such advertisements is either a bluff, a stuff or a pure fake! Neither one is a safe adviser.

MOST farmers are poor speculators. Unless they are unusually keen or have some inside information they rarely make much money by holding their crops. It requires good judgment to know just when to sell. When a man buys a lot of goods he knows what they cost, and knowing how the selling price compares with that cost, he can use his judgment about selling. When a farmer produces the goods it is as necessary to know what they cost as it is when he buys them. Knowing that he can sell when price enables him to get this cost back with a fair profit. The trouble is that most of us have little idea what our crops cost per bushel or pound, and therefore we do not know whether the selling price gives us a profit or not. Thus the very first principle of good farm management is to know what our crops cost. We cannot always figure it out to a dollar, but we ought to know at least whether we can pay ourselves fair wages at the price offered for our produce.

*

WE shall be obliged to repeat the sermon on *"Take heed how ye hear!"* Now we have the following note:

"You have told several times how such crops as turnips and ragweed take potash out of the air. If this is so why worry about the German potash situation?" S. J. R.

We never said any such thing. There is no potash "in the air" and of course plants could not take it out. We have said that certain pod-bearing plants like clover, Alfalfa, peas and beans are able to take nitrogen from the air by means of tiny forms of life called bacteria which live upon their roots. We also believe that certain cultivated plants like turnips and rape and certain weeds like ragweed are able to take large amounts of potash *from the soil*. You have mixed up the *facts* about the legumes or pod bearers with the *belief* about the potash gatherers. All soils contain more or less potash, but it is the *available* supply which we depend on for feeding our crops. There might be enough potash in an acre to produce 500 crops, yet in such a crude or insoluble form that an ordinary cultivated crop could not use it. Now the plants we have mentioned, and others seem to have some power of utilizing forms of potash which other plants do not have. We are sure from our own experience that a crop of turnips or rape plowed into the ground add *available* potash to the crops which follow. They seem to do this by utilizing crude forms of potash and then as they decay giving this potash up to other plants which do not have the same power of using the unavailable forms in the soil. In much the same way we think such plants as buckwheat or the common smart-weed have power to use phosphoric acid in the soil and make it more available. We cannot yet expect to depend on such plants for our supplies of fertilizer, but they will all help, and at this time of potash scarcity they give an additional argument for cover crops. But do not think there is potash *in the air*, or that we ever advised going there for it.

*

AMONG other things this European war is starting a new boom in back-to-the-landing. Here is a typical letter from a young man who thinks of renting a farm for about $50 a month:—

It seems to me that on account of this war, farming is going to be very profitable in the next few years. If so, and this is where I want your opinion, I will make every effort to get the farm and run it myself. If wheat and corn continue high, with advances in all other lines which would naturally follow, I think I could make a good living on it and possibly make enough to make a payment toward buying the place.

This man now has a good position at a cash salary and is doing well. Like many others he seems to think that in some way this war is to make farming very prosperous. There will be a rush to buy or rent farms and put all available land into grain. We can offer little encouragement to such people. Farming is a business requiring experience and good judgment. You cannot rush out into the country, take any land and plant wheat, rye or corn and expect a great yield in the first crop. It will require several years to fit such land as you could rent so it will produce profitable yields of grain. The chances now are that prices for grain and meat will rule high for a year or two, or until the war is over and Europe can once more adjust its business. It will not be all profit, however, for there cannot be such an enormous destruction of life and property in one part of the world without having something of the loss felt in all other parts. We think the farmers who know their business and are wise enough to cultivate their present acres better rather than to rush new land into cultivation are surely coming to a time of prosperity. It is no time, however, for the city man to rush in without experience or capital and expect to make a fortune on a farm.

WE have seen letters from seedsmen who say that owing to the European War prices of Timothy seed have greatly advanced! The farmers who get such letters are not "hayseeds" by a good margin, and they want to know what the European War can have to do with Timothy seed. There has been no reply. Some of the war reasons for advancing prices are certainly the limit. They remind us of the storekeeper in Colorado years ago who charged 25 cents for an old-fashioned watch key. When asked why, his excuse was, "Freight rates are very high." The freight on a watch key is about as good an excuse as the European War for high-priced Timothy seed. We suggest the reading of verse 5, chapter 2, of the Second Epistle to Timothy:

"And, if a man also strive for mastery, yet is he not crowned except he strive lawfully!"

*

PRICES for Hairy vetch and Crimson clover seed have jumped since the European War started. In most cases prices have doubled, and at the present figures it is doubtful whether buying these seeds will pay. It is too late to sow them anyway except in the South. The Agricultural Department makes what we consider a good suggestion:

Under such conditions they point out that it will be better practice to sow rye this Fall and use the difference in price in adding nitrogen to the soil in the form of nitrate of soda or some other highly nitrogenous fertilizer. The rye will afford a Winter cover preventing washing and leaching, and can be plowed under in the Spring to add humus to the soil.

We have, for years, advocated the use of rye as a cover crop. It has slowly changed our own farm from a tough brick-like mass to a mellow soil. We think the above advice is good, and we urge farmers to follow it wherever cover crops will pay. No one will claim that rye fully takes the place of clover; some nitrogen must be added to give equal results, but at any rate our advice for the Fall is *sow rye on all the bare ground.*

*

YOUR editorial on page 994 exactly voices my opinion in regard to the trouble with agricultural college students as farm laborers. I have had students working for me here on the ranch, and have observed much of their work in other places, and their general attitude in the matter, and there is no doubt that the worst trouble with them is an exaggerated sense of their own importance. Many of them are city bred, without a particle of practical experience, but after a year or two at the college, imagine they are capable farm managers. You will do us splendid service by hammering away at our college authorities on this point. W. K. NEWELL.
Oregon.

We have received many letters like the above. Most of them are kindly and written in good spirit representing what we call *constructive* criticism. The writer worked out as a college boy years ago, and cannot therefore be accused of prejudice or of not knowing the subject from both ends. The trouble is that some of these college boys think they can substitute book or class-room learning for that farm instinct which can only come through practical labor. We do not blame them particularly. The trouble comes from their teachers, who often give them too large an idea of the value of book knowledge. It is true that most of our wisdom is carried in books, but let our teachers remember that it was put there and must be taken out again for useful application through the hands.

BREVITIES.

CO-OPERATION, like charity, should begin at home and make good growth.

"KILL the grade bull" is the warlike proclamation printed at the head of a dairyman's letter.

A BLOCK of commercial greenhouses recently pictured by the Florists' Review included 24 houses, each 60x500 feet. The cost of the range, complete, was estimated at $450,000.

SOME of the housewives argue that they will not put up preserves because the price of sugar is so high. But what about the low price of fruit? There never was a better time to make preserves.

THE European War has stopped the talk of feeding wheat to stock in place of corn or oats. The outlook now is for such prices for wheat as human food that the live stock will take what they can get.

CORN in some districts of the Colorado plains had a hard time in August, with a temperature of 108 degrees and no rain for a month. Winter wheat and all Spring grain was said to be the best ever known on the Great Plains.

THE leading French horticultural paper, the Revue Horticole, recently announced that it would cease publication for the present, as its whole staff, editors, correspondents, clerks and printers, had been called to the front.

SASKATOON in Saskatchewan, recently celebrated "hog day" in an effort to make stock growing popular. Western Canada, like the Gulf States, has been buying its pork products from the outside when it is abundantly able to raise them all at home.

IT seems that South Africa has never been troubled with the warbles or grubs which infest the backs of cattle. The insect is brought in on imported cattle, but it is thought that the reversal of the seasons—Summer in South Africa while Winter rages in the north—is unfavorable to the spread of the insect.

THE LAND BANK.

THE work of organizing the Land Bank of the State of New York is progressing most favorably; 30 associations with resources of $16,000,000 have signified their intention to become charter members. About $63,000 has been subscribed to the capital by these associations, and others are only waiting formal meetings to authorize their membership. Hon. Walter L. Durack has been assigned by the Agricultural Department to fill engagements with local associations which require definite information on the subject. He already has the following appointments:

Newburgh	September	21,	Monday
Kingston	"	22,	Tuesday
Troy	"	23,	Wednesday
Glens Falls	"	24,	Thursday
Utica	"	25,	Friday
Watertown	"	28,	Monday
Ogdensburg	"	29,	Tuesday
Syracuse	"	30,	Wednesday
Geneva	October	1,	Thursday
Rochester	"	2,	Friday
Batavia	"	5,	Monday
Albion	"	6,	Tuesday
Buffalo	"	7,	Wednesday
Dunkirk	"	8,	Thursday
Gowanda	"	9,	Friday
Salamanca	"	12,	Monday
Alfred	"	13,	Tuesday
Corning	"	14,	Wednesday
Elmira	"	15,	Thursday
Oneonta	"	16,	Friday
Port Jervis	"	17,	Saturday

The time would be just right for Granges and farm clubs and other farm organizations to get the benefit of Judge Durack's itinerary. If any of these organizations in the State would like to hold a meeting and hear Judge Durack, applications could be made at THE R. N.-Y. office or at the State Agricultural Department; and dates can be arranged. The expense of this organization work is being paid out of the appropriation secured by Governor Glynn during the last session of the Legislature for coöperation in the State. The Land Bank will soon be organized and we should have several farm associations as charter members. As yet we have only two. Farmers should make a point of attending the above meetings as individuals or in a body of their organizations. In other sections the farmers' organizations may arrange meetings of their own; and we shall be glad to coöperate in making the arrangements. If the people of the State fully appreciated the value of this system of realty credits, there would be an association in every neighborhood. This will come in the future, but the sooner the organizations are made the sooner we shall get the benefits; and the larger the number of associations, the greater will be the benefits. When all the people of the State who want mortgage credit are registered under this system, the bonds of the Land Bank will sell at as low a rate of interest as National bonds, and they will be as good an investment, and in some features better.

THE NEW OPEN MARKETS.

ENCOURAGING progress has been made in the development of New York's free markets for the sale of foods. Other sections of the city are now asking for markets similar to the four referred to last week. More farmers have brought in loads during the week, and it is expected that, as the markets become more widely known as a feature of the city's business, many other farmers will make arrangements to come, as they will be practically sure of selling out within a reasonable time.

Meats have been added to the products sold, prices running two to four cents under the regular butcher shops, and fish from New Jersey coast points will probably be offered soon. Fishermen promise to sell the standard sorts caught at this season for eight to 12 cents per pound, or one cent per pound less if not cleaned. A large fresh fish trade could be worked up at such prices, as the majority of buyers are unable to get anything but cold storage fish, which carries more or less risk of ptomaine poisoning.

The situation in the city is developing nicely for the handling of produce direct from farmers' coöperative associations of the State through the new Market Commission provided for in the Food and Market law of this year. The organization of this department has been necessarily delayed in order to give producers an opportunity to form their local associations and be in a position to take up aggressive work in the selling markets. Again this measure was put through in record time, and the opposition to the successful operation of it has been persistent and determined from some of the old influences of distribution, and some time was necessary to study the situation so as to frustrate the opposition and start the work on a plan that would promise permanent success. Governor Glynn is greatly interested in the success of this new department. It was his interest in the measure that secured its adoption by the last Legislature, and he is deeply concerned about its successful organization. The City of New York has now made a small beginning along this line of distributing farm food products direct from the farm to consumers with the least possible delay, and cost of handling. Efforts, however, so far have been confined to inducing local producers to bring their products to the markets in wagons. This is well enough as far as it goes, but such means can never fully supply the New York markets. Provision must be made to receive shipments by water and rail from distant points. This will only require terminal and cold storage facilities and opportunities of the farmers' coöperative associations will then be complete. Now that the Summer rush of farm work is over in the country, and the Summer vacation period is past in the city, these plans will be pushed vigorously. Governor Glynn, the State Agricultural Department and the State Coöperative Committee are all anxious for the organization of the work, and are devoting their best energies to its success. If the city does its part, as now seems likely, in providing facilities, the producer's 35-cent dollar will pass into history as far as the New York market is concerned. Farm food products will flow direct from the farms through these open markets to the tables of the city consumer, and the legitimate and economic cost of distribution will be the only cost of the service.

"WAR TAXES."

THE war in Europe will prevent heavy imports into this country, and thus reduce the revenue obtained from the tariff. It will be necessary to raise money for national expenses to meet this deficit, and President Wilson suggested a system of war taxes. At the outbreak of the Spanish War taxes of this kind were levied very largely in the form of stamp taxes. This proved unpopular and inconvenient, although it gave immediate revenues. The taxing power rests with Congress, and the party in power will be expected to devise a system of taxation and be made responsible for it. It was at first proposed to increase the revenues from the income tax. At present incomes under $4,000 a year are not taxed, and the first suggestion was to tax incomes of $2,000 per year for single men, and $3,000 per year for married men. The balance of the revenue was to be obtained very largely by increasing the tax on liquors. President Wilson, however, objected to the increase of this income tax, because it would fall hard upon the salaried class, and because such revenues would not be immediately available. The party is disposed to do what Mr. Wilson tells them, and it is now expected that the increased income tax will be given up, and larger revenue obtained from liquors by including whiskey and other spirits, while the balance will be levied on tickets for amusements, toilet articles, possibly soft drinks, and other articles of wide distribution which cannot be called necessities. It has also been proposed to levy a tax of 2% on the freight carried by railroads. The exact scheme has not yet been worked out, but it now seems definitely settled that neither the old stamp tax, nor the increased income tax will be levied.

THE WAR AND COMMERCE.

UNDER the amended shipping laws about 40 vessels will be registered under the American Flag during the coming week. These will be used mainly in South American trade, which merchants in this country are working actively to increase. Norway has several merchant ships that will be offered for sale to this country in case the plan for Governmental ownership is adopted.

Since last week wheat advanced to the highest point of the season, $1.29, but dropped three cents later. Buying of oats for war purposes has continued heavy, with price advances of one to two cents per bushel. Sales of flour have been smaller and prices on a generally lower basis.

Various plans are being worked out to save the cotton growers from the clutches of the speculators this year. Citizens in Memphis, Atlanta and some other sections are contributing to build warehouses where cotton can be stored until prices advance to somewhere near its normal value. The growers can store in these places and get money when necessary on warehouse receipts. Where this plan is used the patrons will have to make agreements to reduce the acreage of next year's planting.

All is uncertainty so far as European demand for our raw cotton is concerned. Some increased business in the Liverpool cotton market is noted, but Europe as a whole is too busy with other things to pay much attention to industry.

NEW YORK STATE NEWS.

UNIVERSITY CONVOCATION.—The State University convocation will be held in the auditorium of the State Education Building October 22-23. The program will include Prof. Geo. R. Palmer, of Harvard on "What is a Profession?" Herbert Quick, of Springfield, O., on "Rural Schools"; Mrs. E. M. Harriman is expected to lead in the discussion on this subject. Otis E. Hall, of Crawfordsville, Ind., will treat "Rural School Consolidation." "Educational Efficiency" will be the topic of Prof. C. W. Kent, of the University of Virginia. Brief addresses will be delivered by Gov. Glynn and Commissioner Finley.

STATE FAIR INCOME.—There was a marked decrease in gate receipts at the State Fair this year as compared with last. However, owing to the lessened expenses, the Fair Commission will be enabled to turn over to the State a considerable fund. The gate receipts were about $8,000 less than last year. In addition to making up the deficiency of $20,000 between the $50,000 to be paid out in premiums and the legislative appropriation of $30,000, it is probable that somewhere between $5,000 and $10,000 will be turned back to the State. The total attendance of the week was 161,082 as against 177,823 last year. The total gate receipts were $72,037.50 as against $80,550 last year.

COLUMBIA COUNTY FAIR.—The Columbia County Fair, at Chatham, was one of the most successful exhibitions in its recent history. Opening on Labor Day, the attendance was very large and the following day, being Governor's Day, drew a good crowd. The exhibits were excellent in nearly every class. This fair has a reputation of having the greatest poultry show of any county and this year there were more exhibitors and more birds. The fruit display was hardly up to the average, while in vegetables it exceeded past years.

SANITARY OFFICERS TO MEET.—The 14th annual conference of the sanitary officers of the State will be held at Saratoga Springs on September 15-17. It is expected that about 750 health officers will attend. The conference will be opened by State Commissioner of Health, Dr. Herman M. Biggs, who will introduce Gov. Glynn and he will take for his topic the "Health Department and the State." Among the other speakers on the program are Geo. Foster Peabody, Dr. Albert W. Ferris, Miss Julia C. Lathrop, of Washington, D. C., Dr. Leonard P. Ayres, of the Russell Sage Foundation, Dr. S. Josephine Baker, of the New York City Health Department, Prof. A. C. Abbott, of the University of Pennsylvania, Prof. Geo. C. Whipple, of Harvard, Dr. John W. Trask of the U. S. public health service, Washington, D. C. Prof. Henry N. Ogden, of Cornell on "Farm Sanitation," and Dr. S. A. Knopf, of New York on "Tuberculosis in Rural Communities." One afternoon will be devoted to the discussion of the new milk regulations of the public health council which go into effect Nov. 1. J. W. D.

A SUCCESSFUL FARMERS' CO-OPERATION.

The Way to Combine is to Get Together.

PART II.

SAVING IN FERTILIZERS.—Commercial fertilizer is used in large quantities by truck growers, and the association succeeded in purchasing about 200 tons for its members, at a great saving over local agent's prices. This was partly due to the fact that all fertilizer was paid for when unloaded at the cars. A commission of two per cent., for handling the fertilizer, was charged the grower but it was found at the end of the year that this was not enough to defray all expenses. So the board of directors voted to thereafter charge a commission of five per cent. on all fertilizer handled.

WORK WITH FRUITS.—Although tomatoes were the main cause of the organization, its energies were directed toward other products. When cherries, currants, etc., began to ripen the real worth of the association became apparent. The canneries were buying all cherries they needed at 4½ cents per pound, but Mr. Cook for the association, sold three cars at five cents per pound plus the cost of packages. The canneries paid 11 cents per quart for red raspberries, but the association sold several cars at an average price of 13 cents per quart. Tomatoes in 20-pound baskets were shipped as far south as New Orleans, and netted the growers $15 per ton. With these results the members became highly elated over the success of their organization, but their enthusiasm was dampened somewhat later when three cars of tomatoes shipped south resulted in a total loss. On all produce sold the Association charged a commission of five per cent., except on bulk tomatoes, on which the commission was two per cent. and it also endeavored as far as possible to mail checks to members within ten days after shipment.

EARNINGS OF THE ASSOCIATION.—At the end of 1912 it was found that 607 cars of produce had been disposed of, and a year's business had been done that amounted to $101,138.86. The report showed sales of three cars cherries, one car currants, 21 cars berries, 32 cars apples, 29 cars basket tomatoes, 45 cars mixed produce, 476 cars bulk tomatoes, of which 436 cars went to the one Pittsburg firm. The net earnings for 1912 were $2,403.24. The operating expenses, salaries of manager, stenographer, bookkeeper and day labor, and losses were $2,570.78. This showed a deficit of $167.54. However, at the first annual meeting in December, 1912, with 200 members present, it was unanimously voted to continue the association. On January first, 1913, the stock book showed that 284 shares of stock had been issued. At a directors' meeting in January, 1913, the president, secretary and treasurer and manager were re-elected.

A BRANCH ESTABLISHED.—In February Portland Grange voted to petition the association to establish a branch at Portland. This town is almost 30 miles west of Silver Creek and it was feared that the main office of the association would be too far distant to aid the farmers of Portland materially. But after a couple of meetings had been held more than 30 Portland farmers joined the association, and during 1913 these growers received all the benefits of the organization. During last year over 600 tons of fertilizer were purchased and distributed to the members at a saving, over local fertilizer agent's prices, of $5 or more per ton. This meant a saving of over $3,000 to the members on fertilizer alone in 1913, and a total of over $4,000 in the two years of 1912 and 1913. This amounted to practically $10 per member, or twice the amount each had paid for his share of stock in the association.

EFFECT ON CANNERIES.—Nine hundred acres of tomatoes were grown last year for canneries and preserving firms. Of this amount 700 acres were for the Pittsburg firm that had given the association its first contract for 500 acres. The price last year was increased to $9.18 per ton, which netted the grower $9 per ton after the association's commission of two per cent. was deducted. By this time the local canneries had begun to feel the effect of the growing organization and were compelled to pay $9 per ton for tomatoes, and in a couple of instances the canneries condescended to contract part of their supply from the association, mainly because they were compelled to, in order to secure all they wanted. During September and October last year the tomato business of the association was almost stupendous. The Pennsylvania Railroad ran entire trains of tomatoes to Pittsburg daily, and at times these trains were composed of from 25 to 35 cars, all of them being loaded by the association. To show the growth of the association I will give the report of the amount of business done in 1913 as follows:

MATERIALS PURCHASED FOR MEMBERS.

30 Cars fertilizer	$12,562.62
2 Cars sheep manure	797.95
2 Cars baskets	879.26
1 Car crates	298.80
2 Cars lime	410.50
Seed	718.36
Spraying materials	253.66
Paint	154.24
Tomato plants	5,961.44
Total	$22,036.83

PRODUCE SOLD.

8	Cars grapes
5	Cars cabbage
1	Car corn
7	Cars berries
6	Cars cherries
2	Mixed cars currants and cherries
4	Mixed cars carrots, beets and parsnips
24	Mixed cars currants, plums and gooseberries
47	Mixed cars pears, tomatoes, grapes and corn
47	Cars basket tomatoes
667	Cars bulk tomatoes
818	Cars, amounting to	$128,846.17
Total		$150,883.00

The profits for the year were $5,396.37. The operating expenses, salaries, losses, etc., were $4,522.95. This left a net profit of $873.42.

January first, 1914, the assets were	$3,211.85
The liabilities were	2,505.97
The surplus being	$705.88

There are now practically 500 members, which means that $2,500 of capital stock is paid in. With a surplus of over $700 a five-dollar share is actually worth about $6.30.

Woman and the Home

From Day to Day

THE LITTLE THINGS.

If you are sighing for a lofty work.
  If great ambitions dominate your mind
Just watch yourself and see you do not shirk
  The common little ways of being kind.

If you are dreaming of a future goal.
  When, crowned with glory, men shall own your power,
Be careful that you let no struggling soul
  Go by unaided in the present hour.

If you are moved to pity for the earth.
  And long to aid it, do not look so high
You pass some poor, dumb creature faint with thirst;
  All life is equal in the eternal eye.

If you would help to make the wrong things right
  Begin at home; there lies a lifetime toil.
Weed your own garden fair for all men's sight
  Before you plan to till another's soil.
—Ella Wheeler Wilcox.

*

THE following Winter relish is sent to us with a strong recommendation: Two quarts of white onions, two heads of cabbage, six green peppers, six heads of celery, two heads of cauliflower, two quarts of green tomatoes, six red peppers and one ounce of celery seed. Sprinkle with salt and let stand over night. In the morning drain and cook until tender in a sauce made by mixing two cupfuls of flour with three pounds of brown sugar, an ounce of tumeric and a gallon of vinegar. Be careful to see that the flour forms no lumps.

*

AMONG new knit goods we see military capes. They come a little below the waist, and are close, without any ripple, knitted in the same plain ridge as sweaters. They are seamed down each side, having armholes which are closed by flat dark buttons. There is a close military collar of contrasting color, and four flat brass buttons at the neck. The favorite style is dark blue with dark red collar. This is a very warm and comfortable garment to use like a sweater, and not difficult to make. The new sweaters this Fall are shaped to the figure more than last year.

*

THE Atchison Globe says that swindlers have begun to use the C. O. D. of the parcel post. A package is offered a victim, marked like this: "Two dollars paid, collect $3." The money is paid and the package opened it is found to contain a pair of worthless spectacles, or something of the sort. Authorities are after the swindlers. This is a thing to be borne in mind on rural routes, for country people are very likely to be selected as victims. Of course the swindler must get the address first, and this is often secured through a response to an advertisement in some irresponsible paper.

*

AT a children's party held on the porch one Summer day, each child, on arriving, was taken to a shady place where a number of flower pots were spread out like a flower bed. They were filled with dry moss, and each one had a fancy label bearing the name of a little guest, who was asked to sow a seed in the pot. After games and refreshments the children went to look at their flower pots, to find each one displaying a make-believe plant, formed by "planting" a spray of paper flowers in each pot. At the root of each make-believe plant was a little fancy box containing candy.

*

AMONG the hundreds of women who marched with emblems of mourning in New York recently, as a protest against war, was one young French girl. She explained to a neighboring marcher, as they waited for the signal to fall in, that she "just had to march," to express her feelings towards war. She was alone in New York, her father and mother both dying here within a few months. Her two brothers were both in the French army; she was unable to communicate with them in any way, and did not even know whether they still lived. So she had secured the privilege of a few hours off, for she was a girl who had to earn her daily bread and, clad in her mourning garments, marched as a living protest against the blind force that had entangled her hard-working life in its net.

Home Canning.

THERE is an increasing interest in commercial canning at home. The U. S. Department of Agriculture has been instrumental in forming canning clubs among farm women and girls, and in a "News Letter to Crop Correspondents" issued August 26 they give a table which tells how long different products must be cooked in the cans. The Department recommends the use of commercial canning outfits, and on application to the Office of Farm Management, U. S. Department of Agriculture, Washington, D. C., will give a list of reliable firms that make different kinds of commercial canners. It is admitted that good results are obtained with nothing more ambitious than the customary wash boiler, but one valuable feature of these commercial portable canning outfits is that they may be handled by children as well as by older persons, and young girls who are trying to learn how to can may use them out of doors without interfering with the routine kitchen work. There is also a commercial portable hot-water bath outfit which may be purchased to take the place of the home-made outfit.

CANNING TIME TABLE.

[In "Size of can" column, No. 2 and No. 3 are standard sizes, about equivalent to 1 pint and 1 quart, respectively.]

Products to be canned.	Size of cans, No. 2, pint, No. 3, quart.	I. Home-made hot-water bath outfits, at 212°.	II. Water-seal outfits, 214°.	III. Steam pressure cooker, 5 pounds or more.	IV. Pressure cooker, 10 pounds, or more.
		Minutes.	*Minutes.*	*Minutes.*	*Minutes.*
Apples, whole or sliced, for pie filling	3	15	15	12	6
Apricots	3	15	12	12	6
Asparagus and other greens	2 or 3	60	60	45	35
Apple cider	2 or 3	20	15	12	10
Beans, lima or string	2 or 3	90	60	60	30
Blackberries, dewberries	2 or 3	12	10	6	3
Cherries, peaches	2	15	12	10	5
Corn (without acids)	2	240	180	60	40
Grapes, pears, plums	2	15	15	10	6
Hominy	3	60	50	40	35
Huckleberries	2	10	8	6	3
Okra and tomatoes combined	2 or 3	50	50	40	30
Peas, beets, carrots, etc	2	60	60	45	35
Pineapple	2 or 3	30	25	10	10
Raspberries	2 or 3	15	12	8	5
Sauerkraut	3	50	50	40	25
Sweet potatoes	3	80	70	60	40
Strawberries	3	15	12	8	5
Tomatoes	2 or 3	22	20	10	6
Tomatoes and corn	2	80	70	60	40
Grape juice	2	15	15	10	5
Quince	3	30	25	15	10
Tomato juice	2	20	20	15	10
Pumpkin and squash	3	60	60	45	35
Fish, pork	2	200	200	120	60
Chicken, beef	3	250	240	180	40
Figs	3	30	20	10	5
Rhubarb	3	15	15	10	5

In the table column No. I refers to the home-made outfit, which is nothing more than a washboiler. No. II is a water-seal outfit, hot water and steam combined. This shortens the time of boiling. The third or fourth canning outfits (Nos. III and IV), depend entirely on steam rather than hot water for cooking the fruit or vegetables and are called "steam-pressure cookers." The cooker with five pound pressure (No. III) does the work in much quicker time than the water-seal outfit, and the cooker with a pressure of 10 pounds or more (No. IV) in some instances will accomplish the work in half the time needed for the five-pound-pressure cooker. For example, corn may be satisfactorily prepared in the five-pound-pressure cooker in 60 minutes and in the 10-pound-pressure cooker in 40 minutes.

For altitudes of 4,000 feet or more above sea level add about 25 per cent. time to this schedule.

Canning Meat.

I HAVE canned pork, beef, corned beef and fresh. Cook the same as for the table, season and take out all the bone and pack in glass cans same as you use for fruit. Fill to overflowing with the meat and liquid, seal up and put in a dark place. I have known many other women to can meat also. Be very sure that you pack it solid and have no air bubbles left. MRS. J. W. H.

Green Tomato Preserves.

LAST Fall you printed a recipe for green tomato preserve with ginger. I have lost the paper and valued the recipe very much. Would you repeat it?
MRS. C. E. M.

We printed two recipes for green tomato preserves last Fall, which we repeat, together with a third from the Rural Cook Book which has been popular.

Green Tomato Jam.—Four pounds green tomatoes, four pounds granulated sugar, one cup water, two ounces preserved ginger. Wash tomatoes and cut in pieces, add remainder of ingredients, and cook two hours, or until clear. Strain through a coarse strainer to remove seeds. Put into sterilized jars and seal.

Green Tomato Conserve.—For one peck of green tomatoes, slice six lemons without removing the skin, but taking out the seeds. Put to this quantity six pounds of sugar and boil until transparent and the syrup is thick. Ginger root may be added if desired.

Green Tomato Preserves.—Required, eight pounds of smooth green tomatoes, seven pounds of sugar, one ounce of ginger and mace mixed and the juice of four lemons. Pierce each of the tomatoes with a fork and put them in the preserving kettle with all the other ingredients. Heat slowly, then boil until the tomatoes are clear, then skim them out and boil the syrup until thick. Put the tomatoes into jars and pour in the hot syrup.

In hope and fear persistent more and more . . .
Whilst day and night I carry in my hand
  The golden key to ope the golden door
Of golden home.
—Christina G. Rossetti.

DAVIS DELICACIES
From Ocean, Farm and Orchard

The best fish in the world are brought into Gloucester. We get the first selection and deliver them to you fresh from the boats, in keepable packages, with the sea flavor retained.

The best vegetables in the world are brought to our dock, after being packed, according to our standard, where they grow, in order to assure proper freshness.

The best fruits in the world are unloaded at our wharf from Native Orchards, the South, the Pacific Coast and Across the Seas.

No matter where you live, we guarantee to bring to your door Nature's choicest products from Ocean, Farm and Orchard, *packed as they grew and packed to keep.*

We sell direct to you —never through dealers

FRANK E. DAVIS COMPANY DELICACIES GLOUCESTER, MASS. FROM OCEAN FARM & ORCHARD

Express free on $3.00 orders east of Kansas

OUR SEA FOODS range from the Mackerel (fresh or salted), Codfish (fresh or salted) Salmon, Lobsters, Crabs, Clams and Shrimp of our native waters, to the specialties of Italy, France, Portugal and the North Sea Ports.

OUR FARM PRODUCTS include all the good things that grow in or near the ground, special cures of bacon, dried meats, pork-and-beans and other New England goodies.

OUR ORCHARD SPECIALTIES are gathered from the selected crops of American and more Tropical Climes.

All are of a quality rarely found even in the best markets.

We are glad to send, upon request, our descriptive price-list telling of the many specialties we handle and how best to enjoy them. Our free *Book of Receipts* is an authority. Fill out coupon today and begin to get your share of these unusual delicacies.

Mrs. Suburbs:—Oh, Anty Drudge were you on this late train, too? I've worried all the way home for fear I'll oversleep to-morrow. I want to wash all my blankets, and I'll have to get up before five or I won't get them done.

Anty Drudge:—If you do them my way you needn't worry about getting up so early. I'll step around to-morrow about nine o'clock, and show you how easily and quickly Fels-Naptha Soap will do them for you. You'll be buying it by the box, like I do, after to-morrow!

Fels-Naptha Soap makes blankets, flannels and woolens as soft and wooly as when new, because there is no hard rubbing to harden them and soaking is not necessary. Clothes washed with Fels-Naptha are sweet, clean and white and last twice as long. Just soak for about thirty minutes, in cool water and Fels-Naptha, give a rub or two, rinse and hang on the line.

All your housework can be done as easily and quickly. Dirt disappears, and grease dissolves.

Fels-Naptha cleans porcelain tubs perfectly.

Buy it by the box or carton and follow the directions on the Red and Green wrapper.

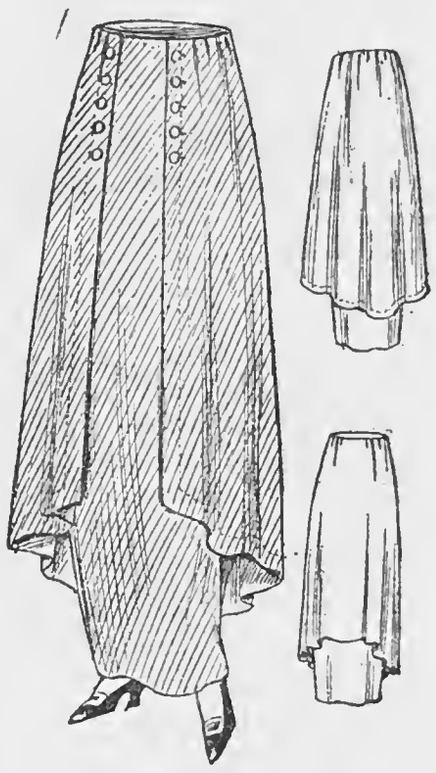
Fels & Co., Philadelphia

FELS-NAPTHA

A DRESSMAKING LESSON.

Making a Tunic Skirt.

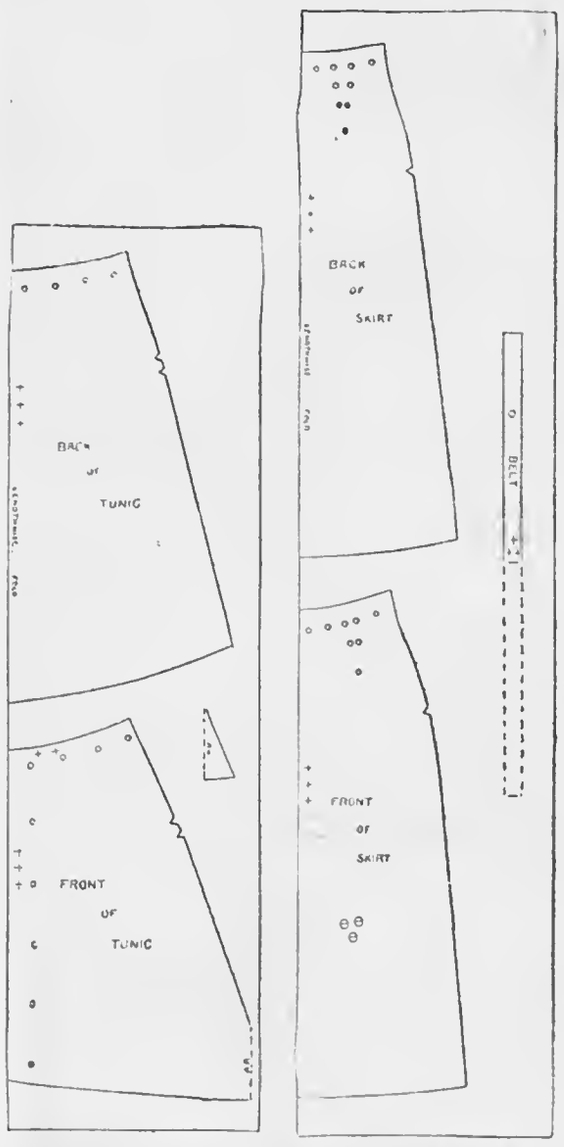
MANY amateur dressmakers seem to find the tunic skirt a problem, so we asked May Manton to give us a practical lesson on it. This is a very useful pattern for making two old dresses into one new one, as different materials may be



8341 Russian Tunic Skirt.

used for skirt and tunic, the waist being combined to correspond, sleeves or trimming being of the one material, bodice of the other. The lesson tells how to make the skirt from 44-inch material. With the open tunic the entire skirt should be of one material, but with the closed tunic it is wiser to reduce both the weight of the skirt and the cost by using lining material for the skirt and facing it to a sufficient depth above the edge of the tunic.

In the diagram at right are shown the two portions of the skirt and the belt, in the left, the two portions of the tunic; all laid on material 44 inches wide folded



The Pattern on 44 Inch Material.

lengthwise. Note that in the case of the tunic there is a tiny little section separate from the main portion of the front. The section must be cut separately and seamed to the side edges because the material is not wide enough to cut the entire tunic in one piece, but when the seams are well stitched and carefully pressed they will not be noticed. If you use narrower material, it will be necessary to make larger piecings of this sort. This skirt can be made with either a high or a natural waistline, but we will first consider the high waistline shown in the illustration.

First, smooth out the different pieces and pin them carefully into place, as indicated, with the edges marked by the triple crosses on the fold. The group of three large perforations indicates the front of the skirt and it is important to bear this in mind since the two pieces are much alike.

Mark all around the outside edges with a tracing wheel or tailor's chalk and mark the various notches and perforations. Mark through to the other side with tailor's tacks. Then cut your materials as far beyond the traced outline as is necessary to make a good seam. For broadcloth or other closely woven material a narrow seam will suffice, but if you are using loosely woven material that will fray readily a wider seam will be needed. Baste on the traced line and the perfect contour will be preserved.

To make the skirt, close the seams, leaving an opening at the left side above the notches. Under-face the front edge of the opening and finish back with an extension underlap. Take up the darts in the back of the skirt only, bringing the perforations together.

Close the portions of the tunic, leaving an opening at the left seam above the notches and finish as directed for the skirt. If you like the open edges, cut the tunic through at the center front and turn the edges under on the lines of perforations. Then finish the lower edge. If the closed tunic is to be used, finish the lower edge in the way best adapted to the material. Gather the tunic at the upper edge between the double crosses and arrange it over the skirt with the center backs, seams and edges of the plackets exactly together, with the front edges of the open tunic two inches within the center of the skirt or the center of the closed tunic exactly at the center of the skirt. Arrange both skirt and tunic over webbing or belting one and one-half inches wide, and close invisibly.

For the natural waistline, mark the double crosses in the tunic below the perforations at the uper edge: then cut all portions of the pattern off on the perforations nearest the upper edges and proceed exactly as directed, but take up the darts in the front as well as in the back of the skirt. Join both the skirt and the tunic to the belt with the center backs together, the center fronts at the large perforation in the belt, and cut the left side of the belt off at the edge of the opening.

For the skirt will be needed 3¼ yards of material 27, 2⅝ yards 44, 2⅜ yards 50 inches wide, and for the tunic 3½ yards 27, 2⅛ yards 44, 50 inches wide. If remodeling is in process and there is already a two-piece skirt on hand, the tunic can be adjusted over that quite as well as the one in the pattern. If one has a blue serge suit, the addition of a tunic of black taffeta or black moire bengaline with coat trimming of the same would make a new costume at very little cost.

Concerning Preserving Powders.

ONE August day, my neighbor came calling. She brought a parcel which she carefully placed upon the table. After a while, when greetings had been exchanged and we were comfortably settled for a good chat, she undid the wrappings, disclosing a glass jar of canned corn which she held up for my inspection.

"I brought this over for you to try, Marie," she said. "I know you prepare your Winter supply of corn, and use the tedious, long-boiling process. Sister and I have been doing ours a new way. You add this powder to the corn, cook 20 minutes, and put into the cans. It keeps splendidly. I'm sure you'll like it, for it's so much easier."

Forewarned is forearmed; I knew that injurious substances are usually found in such preparations, so was not attracted by the bait, but it annoyed me to find my friend, a frail woman past middle age, so easily misled.

"Now, Henrietta Brown," I scolded, "do you know what that stuff is made of? Of course not, neither do I, and that is a good and sufficient reason why I will not use it. The Department of Agriculture has sown bulletins broadcast over the country, explaining to the housewives how to preserve their vegetables and save money. Their way is to sterilize by heat. Do you think if there was a safe short cut they wouldn't mention it? The stuff which is put into those proprietary preparations is the very same that has been forbidden to the manufacturers by the pure food laws—boric acid, salicylic acid, saccharin, and others. It amounts to this: The men who prepare canned goods are no longer allowed to poison us wholesale, so we buy the same ingredients and poison ourselves, because it's so much easier. Let me show you what the authorities say about it."

I hunted for the bulletins from which I had gleaned my little store of information and soon found what I wanted. Then I read extracts, telling of careful experiments, made by chemists employed by the government, to determine whether these preservatives were harmful, and of the results obtained; also other extracts, warning the housewife against so-called preserving powders which, in small quantities, may not injure a person in normal health, but which may produce effects of a serious nature in a child or invalid. It was all plain and convincing, and Henrietta's face was very sober when I finished. She didn't say much, just thanked me, put on her hat, and went home.

"She wants to consult with her sister," I said to myself, "but she'll do the right thing in the end. One may trust Henrietta for that."

The same evening I was summoned to the telephone and found my neighbor on the line.

"Sister and I have talked it over," she said, "and we've decided to write to the Bureau of Food and Drug Inspection, in Washington, D. C., and find out about that preparation. You see we don't like to throw away all that good material unless we really know that it is harmful."

I warmly applauded this decision, for it shifted a load of responsibility from my shoulders. A week later, Henrietta called me again by telephone.

"Well, it has turned out as you predicted," she said. "We wrote to the chemists and sent a sample, though we didn't need to, for they knew all about it. The answer came yesterday. The preparation is mostly boric acid. I've just made a clean sweep, and dumped all that corn in the pig-trough. I guess now I'll stick to the good old way."

"Never mind," I consoled her, "it's better than poisoning John and the children. I'll come over any day you say, and help you can another lot."

Then I hung up the receiver with a sigh of relief, for it was plain that my neighbor was a wiser, if also a sadder woman.

M. E. COLEGROVE.

THE following is a tested recipe for preparing tomato figs: Select six pounds of small pear yellow and red tomatoes that are fully ripe, or use the little peach tomatoes. Put them in a basket, plunge them into boiling water for a moment and remove the skins; do not break the tomatoes. Cover the bottom of a porcelain-lined kettle with a portion of three pounds of sugar; put over a layer of tomatoes and the remainder of the sugar. Do not have more than two layers of tomatoes; in fact, it is better to do one layer at a time. Cook over a moderate fire slowly until the sugar penetrates to the very center. Dip tomatoes out with a skimmer; spread on platters and set in the hot sun for one or two days. Take in at night before the dew. While they are drying sprinkle several times with granulated sugar. When perfectly dry put between layers of waxed paper in tin boxes. They keep well, and are very dainty.

Live Stock and Dairy

A HAMPSHIRE HOG.

MR. BEN B. HUNT of Barry County, Michigan, sends us the picture which is shown on this page. He calls it a picture of a Michigan-bred Hampshire boar, and also a Michigan-bred boy on his back. Mr. Hunt says he has 51 of these belted pigs, and he is very much pleased with this breed. It would be interesting to know in what way, aside from the belt and the peculiar appearance, this breed is superior to others, such as Berkshire or Poland China. Sometimes a man who takes a fancy to a particular breed of live stock will have something of a job in telling why he considers it better than any other. It might be a good plan to develop a discussion along this line, and see how many of us can really give sound and convincing reasons to prove

GOOD NATURED HAMPSHIRE BOAR.

that our favorite breed is better than the one kept by the neighbor. At any rate, this Hampshire is a good-natured hog, and the boy seems to be having a comfortable ride on his back. Generally speaking, however, we think it is a mistake for children to play very much with these barnyard brutes, as no one can tell when they will turn and take advantage of you for an attack.

HAMPSHIRE SWINE.

I HAVE only been a breeder of Hampshires for two years. In my opinion these hogs develop faster than any other breed, and we have had them all. I sold nine last year on the market that weighed 202½ pounds each at 173 days old. They are a distinct bacon and ham hog. At the International Fat Stock Show they did not win the prize, but they sold for 75 cents above what the prize winners sold for. As for rustlers they are the best and they are not always looking for a hole in the fence. Some of this breed will weigh 1100 pounds at two years old. The stock hog pictured will not be a year old until September 27, and he weighs close to 350 pounds. The sows are kind and gentle and you can do anything with their pigs, also the boars, My boy drives this one as he would a dog. The sows raise large litters, from nine to 16. I have used my boar on about 12 sows and they will average about 10 apiece; some of the sows are not a year old yet. I have bred to a number of different breeds, and half of the pigs are belted. I would not have any other breed on the place. I can get $10 for every six-weeks-old pig I raise that is well belted. The Hampshire Breeders' Association takes the best of care of its members.

Michigan. BEN B. HUNT.

TREATMENT OF HOG CHOLERA.

ON page 1038 F. C. Minkler, of the New Jersey Experiment Station, makes a statement that I think may be misleading to many of your readers, and I am sure that he would not wish to be misunderstood. The phrasing would seem to indicate that he thinks animals fed on garbage will become immune to cholera, and while this may be true of the garbage-fed hogs of a certain locality, that is, there may be some hogs in a certain locality that are fed solely on garbage and have become immune to the disease, I know from the experience of contractors for the removal of garbage in Philadelphia, that cholera is as much of a menace to their herds as to any other. I know of one such man who lost practically his entire herd from the disease. Moreover, when piggeries in "the neck" were prohibited and the animals disposed of to farmers, many herds and places hitherto uninfected, were infected, both the imported and the resident animals being affected.

I quite agree with him that something should be done to eradicate this disease as soon as may be. This State, New York and New Jersey, are as yet practically free from the disease, but if the prohibition of immunization by the virus-serum method is continued for long by the different live stock sanitary boards, sane business men cannot be induced to take the chances of extermination of their herds, particularly when the herds are purebred and their value large. The loss of one animal to a constructive breeder may undo the work of years, and be a loss to the community that is impossible to measure in dollars.

Cholera is menacing the meat market of the future. With the present world-wide shortage of all meat-producing animals, and the present possibility that several cattle-raising countries will be prevented, for some time to come, from supplying their own needs, every facility should be given to cattle and stockmen in every part of this country to safeguard their interests, and thus guard against a meat famine all over the world. Scientists admit their ignorance of the disease. Practical men have found a practical safeguard against it. Why do some authorities deny in some States the right to use a method or practice universally accepted in every country in Europe, all the States of the corn belt, where cholera has raged and been checked, and in many other States less afflicted by this scourge than Pennsylvania, New York, or New Jersey? D. BUCKLEY,

Secretary Pa. Berkshire Breeders Association.

IT was far from my intention in making a reply to inquiry on page 1038 even to infer that the feeding of garbage was a means toward the end of immunizing hogs against cholera. I only cited the instance which was given me by a prominent serum-producing concern, in which they stated that they had been able to utilize garbage-fed hogs in the production of serum to great advantage, as they found it possible to inject into these animals large amounts of virus without the use of protective serum. I am well aware of the difficulty experienced by swine raisers adjacent to cities who utilize garbage as a source of feed for pigs. Of course, the serum treatment is by all odds the safest, and since scientists do not seem to tell us exactly why certain exclusively garbage fed pigs have this immunity, I merely advanced the suggestion that this condition might be due to the fact that such animals were naturally immune as results of obtaining in the garbage, residue pork products containing the cholera bacillus. There is no such law in New Jersey as prevails in Pennsylvania prohibiting the use of simultaneous treatment. We use virus in this State to establish permanent immunity with good results. It is exceedingly difficult to take the view-point of prohibiting the use of virus and not prohibiting the importation of hogs from other States that have been simultaneously treated. Just what the Pennsylvania authorities could do in case simultaneously treated animals were shipped into the State, I do not know.

The cheapest insurance that I know of against hog cholera is the simultaneous treatment, provided of course, the serum protects. On the other hand, unless I was sure that cholera was in the neighborhood, I would not use the double treatment, but rather rely on the serum alone treatment as the first means of protection, if cholera did break out in the herd, this to be followed in 10 days with the double treatment with such animals as are in the proper condition.

Seemingly I overlooked that part of Mr. Cochran's inquiry relating to the use of sour milk in swine feeding. Our experience goes to show that in case the milk can be obtained sweet every day, there is no advantage in souring it before feeding it to the pigs; on the other hand, if there is any irregularity in the delivery of the milk so that one day it would be sour and the next day sweet, I would by all means sour all the milk and feed it to them in this same condition every day. It is the change from the sweet to sour, off and on, that causes disorder with the pigs' digestive system.

There is another phase of the hog cholera question that seems important. If the proper officials were given authority to go in any neighborhood where cholera prevails and establish strict quarantine measures, cleaning up the premises where the disease prevailed, and using serum alone in all adjoining herds, I am satisfied that the outbreak could be conquered without the use of virus. It is a common practice in any neighborhood, that when one farmer commences to lose his hogs, his neighbor is apt to visit the farm, go into the hog lot and inadvertently carry away with him on his boots, the germs that are eventually responsible for the outbreak in his own herd. Strict and prompt measures of quarantine would, without doubt, be the best means of localizing and eradicating the disease in any community. The use of virus should not be prohibited, but strictly supervised and regulated. FREDERICK C. MINKLER.

N. J. Experiment Station.

STATEMENT FROM THE DAIRYMEN'S LEAGUE.

THE sales committee appointed at a recent meeting of the directors of the Dairymen's League to endeavor to market the milk for the Winter months, have thus far been unable to arrange any terms for the sale of the league milk. The Borden's Condensed Milk Co. refuse to confer with the committee in any way. Other dealers who have been approached treated the committee more considerately, but hesitate upon agreeing to give any definite price unless Borden's and other principal dealers do the same. The unsettled conditions in Europe and the effect upon the cost of dairy feeds, and the price of foods in general, offers a very difficult problem for the committee and they feel uncertain as to the advisability of making or agreeing to accept a schedule of prices for so long a period as six months. It has been decided to suggest that members not sign any contracts should the dealers in conformity to their usual custom ask the producers to sign them about September 15.

A meeting of the directors has been called for Friday, September 18, at 10 a. m. at the Agricultural Department, Albany, N. Y. It is requested that each branch call a special meeting of all members and select a delegate to attend this meeting, bringing the sentiment of their branches as to their willingness to accept the price which the dealers offer, or whether they shall contest for a league price, and, if so, what percentage of their membership will positively stand for such price to the extent of manufacturing their milk for a period of 30 days, should it be necessary. If not possible to be represented by a delegate, advise us by mail just your position.

The directors feel it is becoming more and more apparent that each branch or locality should be prepared with a plant to care for their milk in time of necessity or surplus. A success in contest is but a temporary advantage.

There are now 187,000 cows subscribed for in stock, about 5,000 of which have gone out of business. 137,000 cows are subscribed for in agreements. We especially urge at this time that each branch strengthen their position by securing new stock subscribers, and have all subscribers sign agreements.

ALBERT MANNING, Secretary.

Milk Yield of Goats.

WHAT is the average quantity of milk from a milch goat? What is the period of normal milk flow?
New Jersey. E. J. O.

A good milch goat should give from one to two quarts of milk daily, much less than the latter amount from a mature doe not being considered profitable. A doe with her first kid is not expected to yield as much, three pints being a fair amount, and these yields should be maintained for six or eight months. Goats are reported as giving milk continuously over a period of several years without renewed gestation. M. B. D.

WE prefer Ayrshire and Holstein bred cattle, for the reason we are satisfied. They will produce better results than other breeds. Especially for larger quantities of milk. They are proven by my experience to be very healthy and rugged animals, also good heifers. A. S. E.
Connecticut.

LEADING A COW.—On page 992, J. A. D., Eastport, Me., wants to know how to lead a cow. Don't lead her, but drive her; tie one end of a 15 or 20-foot rope to a hind leg just above the dew hoofs. Hold the rope so tight that she can't take a full step with that foot. Before you have gone 20 rods she will go so quietly that it will surprise you.
Westfield, N. Y. J. M. S.

THE DOG PROBLEM.—I believe the only solution of the dog problem, mentioned so often in connection with sheep-raising, will be to make every dog wear his tax receipt, in the form of a tag attached to his collar, and put the others "under the ban of the empire." Without such a mark it is hard to distinguish the taxed from the untaxed, and probably the untaxed do the most damage. This is the essential part of the Maine law as described by Mr. McKean some time ago in THE R. N.-Y. W. J. M.
Ohio.

SHEEP AT THE N. Y. STATE FAIR.—Owing to prevalence of hog cholera last year it was thought advisable not to show swine this year. The sheep exhibits at the fair were less than former years, owing to the Toronto and the Ohio State Fair dates conflicting with those of the New York State. The Dorsets were the strongest they have ever been on the grounds. The exhibits were from New York, New Jersey and flocks from farther east, and some Canadian stock was shown. Special prizes were offered by the Shropshire, the Southdown and the Hampshire associations. The improvement in quality is good evidence that the farmers are becoming more interested in good sheep in New York and Eastern States, and are breeding from stock selected from well-known herds. At the fair there were a number of sales made by the large exhibitors to farmers who use the new blood in improving their flocks. It is necessary that more sheep should be raised in New York State to produce profit from waste land and further supply the demand for meat.

"MERIDALE FACTS"

MERIDALE A.J.C.C. JERSEYS

for 1914 presents a significant record of herd building. It tells of 135 tested cows in the Meridale Herd with an average yield of 7982 lbs. milk, 512 lbs. butter per cow. 31 of them were two-year-olds. It shows an average increase of 1033 lbs. milk, 98 lbs. butter per cow during five consecutive years of authenticated testing.

We shall be glad to send you a copy, and to tell you of some of the bulls and heifers now for sale from the herd of which this steady progress is recorded. These youngsters are bred to work similar advancement for you.

Pureбred Registered
HOLSTEIN CATTLE

Our Advanced Registry of milk and butter-fat records shows that we have 22 cows each with productions of above 875 pounds butter-fat or 1093 pounds of butter for the year. All other breeds together cannot show that number of cows with records of equal production. Of all that is being done for the advancement of the dairy industry, nothing exceeds in value the work of the testing associations. The records made do much to prove the supremacy of the Holstein cow as a milk and butter producer. For facts

Day after Day, Year after Year, PRODUCTION COUNTS

It is not what a cow can produce in 7, 14, or 30 days, even in a year that determines her value to the farmer. It is what she can do in a lifetime.
Brown Swiss Cows rank high in average production and are regular and persistent breeders and producers. Year in, year out, they make good records and raise good calves without any coaxing or pampering. If interested, we will send you an illustrated booklet.

The Brown Swiss Cattle Association
IRA INMAN, Secretary BELOIT, WISCONSIN

SWEET CLOVER FOR HOG PASTURE.

I WOULD like your advice regarding the sowing of Sweet clover. I would like to sow it in an apple orchard as pasture for hogs, and later, when inoculated, sow pasture in Alfalfa. It is now in sod except where it has been rooted up by the hogs. Soil is stony, but level and in good condition. Would it be advisable to sow the Sweet clover alone or with rye, and let the hogs harvest the rye next Summer? J. R. C.
Pittstown, N. J.

Sweet clover is rapidly gaining in popularity as a forage crop suitable for use for cattle and swine, and it would seem that it is very well adapted as a source of green forage for swine, it being undoubtedly hardier than Alfalfa and probably more resistant. Our experience has been limited to its use in combination with rape and Soy beans. Early in April we seeded a small area utilizing the following mixture: Oats 30 pounds; Canada field peas 30 pounds; Dwarf Essex rape 6 pounds; Sweet clover 15 pounds. The oats and peas furnished early forage, but during late June, July and August the rape and Sweet clover has furnished an abundance of forage. I am satisfied that a combination of Soy beans, rape and Sweet clover forms the basis of one of the very best forage crops available for swine. To our surprise the Sweet clover was extremely palatable, and unlike Alfalfa, can be safely pastured the first year. It it necessary to keep the plants fairly well pastured down, and not allow them to branch out with their woody stems. I do not know how the Sweet clover will winter in this section, but if the vigor and vitality of stray plants along the roadside forms any criterion, it is safe to assume that the plants will be extremely hardy and vigorous. One of the strongest features of this rape-Soy beans-Sweet clover combination is the fact that the mixtures can be seeded any time from early Spring until the first of August, and furnishes a feed extremely rich in protein and unusually palatable. The mixture that we have used this year is made up as follows: Soy beans one bushel; Dwarf Essex rape six pounds; Sweet clover 18 pounds.

The Soy beans were drilled by themselves, while the rape and Sweet clover were mixed in this proportion and seeded with a press drill. We shall have some very interesting facts later in the season to show the comparative value of this combination, for all our brood sows have been feeding in this field since early in July, and have not been fed any grain in addition whatsover. They are gaining from three-quarters to a pound a day and are evidencing unusual thrift and vigor.

At the present time we have about 20 brood sows, averaging about 300 pounds each, and 20 Spring gilts averaging about 100 pounds each, that are pasturing in a four-acre field, the former obtaining their maintenance exclusively from the forage plants. Rather than seeding the Sweet clover and rye mixture as suggested, I would prefer to utilize rye and vetch as a full mixture, reserving the Sweet clover to be seeded early in the Spring, with rape, following rye and vetch, which can be used as an early grazing crop or plowed under as a cover crop. F. C. M.
N. J. Experiment Station.

SOY BEANS AND CORN.

IT is my own opinion that as a general proposition, corn is the king of silage crops. Personally, I have had no experience with other crops except Soy beans. I am very sure that while the beans may help to balance the ration the yield is so much less than that of corn that I can balance the ration more cheaply with cottonseed meal or other concentrate. However, I believe it worth the time and expense to mix a few medium green Soy beans with the seed corn. Under favorable conditions the beans will make a considerable growth, apparently, without hurting the corn at all, and if inoculated they undoubtedly add some nitrogen to the soil. If the weather is rather dry the corn will swamp the beans, and if there are many woodchucks they, will eat most of them.

This year my Soy bean seed did not germinate well, but despite the fact that the corn is very thick and rank, and that up to three weeks ago the weather was exceedingly dry, the few beans that came up have made considerable growth, and had the seed grown well would have made considerable silage. In case of a short corn crop or wet weather at silo filling time it might be advisable to mix other crops with corn in the silo, but generally speaking I should prefer to hay the other crops, and make silage of corn, and so far as my observation goes, that is the experience of others.

In regard to mixing Soy beans and seed corn, I might state that one must not treat the Soy beans with arsenate of lead, as is sometimes done with corn to keep crows away. It will not hurt the corn, but the beans will not germinate when so treated. Last year I treated the mixed seed with arsenate of lead and planted where the planter had skipped a couple of rows, and while the untreated corn germinated almost perfectly, every treated Soy bean rotted. And the crows pulled most of the corn, too. CHESTER L. MILLS.

AILING ANIMALS.

Cribbing.

IS there any remedy for cribbing? I have a fine, young colt that is a cribber, and would like to cure him of it if I can. C. B. C.

Cribbing is incurable when confirmed. Keep the colt in a box stall from which everything has been removed on which the teeth or chin could be set to practice the vice. Windsucking may be stopped temporarily by buckling a wide strap fairly tight around the neck just back of the throat-latch. Another plan of stopping the vice is to tie one end of a small rope to one r' " of the halter or bridle, pass the other end under and across the incisor teeth of the upper jaw, under the lip and after drawing fairly tight tie the free end to the other ring.
A. S. A.

As to Rye for Horses.

WHAT do you say about rye feed for horses? We are feeding ground rye and oats mixed half and half by weight, 15 quarts to each horse daily. How could that ration be bettered for heavy work nine hours per day? It is a fact that our horses shrink more than others. We do not grow wheat or oats. Has rye ever been known to kill fowls?
New York. C. E. B.

There is only one more unsuitable grain than rye for horses, and that is wheat. If a horse breaks loose and gorges on either rye or wheat acute founder or death commonly results. Stop feeding rye and add one ninth part of wheat bran to the whole oats. Do not feed ground feed to a horse that has good teeth. Ergot often present in rye might kill poultry, if taken in large quantities, but we have no record of such an experience. A. S. A.

Hard-milking Cow.

I HAVE a Jersey cow that just had a calf, but I am unable to get any milk from her. The calf can get no milk, as no milk comes down into the teats. She has an extra large udder, looks as though she should give at least 20 liters of milk. The cow seems to be in good health, very little fever if any in udder, and very little caked. I know nothing of the cow's past life as I got her with some other cattle when she was dry. She is about eight years old,. Do you think using a milk fever outfit and pumping air into her udder would help any? I have sent for one; have no veterinary to go to here, although .. town close to 40,000. M. V. J.
Mexico.

It will not pay you to fuss with this cow's udder as interference will be likely to do more harm than good. Better let the calf nurse, if you find that it is getting enough milk, and when it is weaned fatten the cow for slaughter. A. S. A.

Roaring.

A YOUNG horse, about 5½ years old, is suffering from throat trouble. When he was three he had the tonsils, as horses are liable to at that age; something grew in his throat, so that he cannot breathe freely when he runs or works hard. There is a noise in the throat. A veterinarian suggests putting a tube in the trachea. Will that be any good? A. B.
Massachusetts.

By "tonsils" we understand you to mean that the horse had an attack of strangles (colt distemper) which has resulted in "roaring" (laryngeal hemiplegia). The insertion of a permanent silver trachea tube would enable the horse to breath without roaring; but it would not cure the condition given rise to roaring. That might be remedied by the operation of arytenotomy to be performed by a qualified surgeon. Treatment other than this would not be likely to do any good. A. S. A.

"DOES my practicing make you nervous?" asked the man who is learning to play the cornet. "It did when I first heard the neighbors discussing it," replied the sympathetic person. "But now I'm getting so I don't care what happens to you."—Washington Star.

"NOW I have the best roof in this township. One that will last—one that's waterproof—one that will resist the hardest storms—and I didn't have a bit of trouble laying it."

That's about what every Amatite owner says. Its superiority over all other ready roofing is apparent to any one who uses it.

Amatite does away with all roofing troubles and unnecessary expenses because it is made with a real mineral surface that *needs no painting*. It is durable, fire-retardant, practical, economical.

Don't buy any other roofing till you look up Amatite.

THE DAIRY COW SITUATION.

LAST Fall I wrote you concerning the dairy situation in this locality, and especially about the supply of dairy cows and the prices that they were bringing. At that time I made the prediction that the Spring of 1914 would see dairy cows selling at a higher price than ever before, and on the strength of that belief, I bought a number of young cows with the idea of carrying them through the Winter and selling them again in the Spring.

We had a long hard Winter, and the cows ate a great deal of high-priced feed—but they did not bring the anticipated high price. Why? Well, when the Bordens announced the price that they would pay for milk the next six months, that price was below that of last year, and therefore there was no incentive for the dairymen to stock up with more cows. Funny situation, isn't it? Cows scarce, feed high and every prospect of good prices. Yet the Bordens calmly say, "We can't pay as much as last year." So the price goes down.

In this immediate neighborhood there have been pastures without a foot of stock on them because the owners say that they don't like to milk well enough to do it just for fun. At present there are but few cows for sale, and these are being picked up as they near freshening at about $100 a head for the good ones. The poorer ones sell for less, and the best ones go higher. For the past few years but few heifer calves have gone for veal, but this past season a reaction has set in and fewer heifers are being raised.

This of course does not apply to the purebreds. Madison and Chenango Counties contain more registered Holsteins to the square mile than any other section of equal size in the country. The desire to own purebreds has got hold of most of the farmers, mainly, I suppose, because more money is to be made from the purebreds if rightly handled. But I also think that a good many buy purebreds just because it is the fashion to do so, just as Smith buys an automobile because his neighbor Brown has bought one. A few years ago plenty of registered Holstein heifer calves could be bought for $50 each, but now it is hard to find one at less than $100, and those from good A. R. O. dams go at higher prices.

Last Spring the Madison-Chenango Holstein-Friesian Club organized an auction sale, and about 200 head of cattle changed hands, but the greater part of them never left the two counties. There were plenty of farmers waiting for a chance to make a start in purebreds. There were some excellent cattle in this sale, one bull calf selling for $3500 and at least two cows at $2000 each. J. GRANT MORSE.

WHAT CROPS FOR THE SILO?

THE question is asked as to mixing crops for silage, and the drift of opinion about this plan. In my own section, the corn plant has proved so eminently successful and superior for silage, that mixing other crops in with the corn as it goes into the silo, practically using a "filler" with the corn, is seldom if ever heard of now. The idea is to get, by the mixing, a larger proportion of protein from the added crop to balance up the corn part. North of the Ohio River, the difficulty is to get two crops to mature at the same time, so to make a good quality of silage or even "harmonize" in the fermenting stage in the silo, and the result is, as corn "cooks" at a much lower temperature than the proteins, one get a flavor and taste that it not well relished by the cows, and possibly rejected in part, and roundly berated by the milk inspector. In the droughty sections of country, silage can be made with more success when Kaffir corn, sorghum, and beans are used, but even then the advice is to silo them separate. Any of our larger protein producing crops, when siloed with corn, cause a great loss of digestible matter in the latter, and the waste is far greater, and more than counterbalances the advantage of mixture.

Cow peas, Soy beans, and the like make good silage when pitted each by itself, but great care must be taken in putting them in, or the ferments will go too far, and the silage will be a close approach to decay, filling stables with an odor that is not "passed in silence" by the milk inspectors. All of these protein crops if siloed, need especial care in putting into the silo. They must not be too mature, they must be cut into the pits, the finer the better, and well distributed, and unlike corn, the more it is packed and tramped to force the air out the better. Do not rely upon its own settling to expel it fully, as it will not pack down by the heating, as will corn.

Now and then one hears of some one who tried cutting in Soy beans with the corn, and the plan was liked, but is never heard of more; the dry curing of the clovers and beans goes on as before. With the advent of Alfalfa, its perfect blending as cured material with the silage, and the great amount of protein it affords to the acre, it does not seem that there is longer any reason why the raising of uncertain protein crops should be continued, or even fabulous prices paid for mill feed to balance up with. It may be in more southern sections, and may yet be the better way to raise them instead, but it is far from proved, that mixing them in the silo pits, with the corn, is the better, or even a more profitable way.

Ohio. JOHN GOULD.

LIVE STOCK NOTES AND PRICES.

Sept. 1. Good rains ended the drought here Aug. 10 and all last week was rainy; is too wet to plow stubble land. The creeks, branches and ponds were full for the first time since February. The prospects are good for tobacco, late corn and potatoes. A great deal of Alfalfa is being started. Pastures are good, stock looking better. A large acreage of wheat will be sown this Fall. Several new silos are being built. Plenty of peaches and apples seling at from 25 to 75 cents a bushel; wheat $1.03; corn 90; hogs $9; hens 11; Spring chickens 12; butter 18 to 25; eggs 19. E. S. K.

Boonville, Ind.

Sept. 1. We are in the Pittsburg market milk territory, and the tendency is toward higher prices each season, with more and more restrictions laid down by the city inspectors. There is some butter and some cheese made around us, but the amount of milk available at butter and cheese prices is growing less each year. Good grade cows have sold as high as $125 at public sales. This high point was about two years ago. Now the best grades usually sell at $80 to $100. There are not very many for sale just now at any price; almost everybody is wondering how matters are going to shape up for Winter. Prices are changing so rapidly that it is a decided gamble when you buy more than a day's supplies. Our people depend very largely on mill feeds, and if feed goes up while milk does not, a large proportion of our dairymen will talk sell, and some may actually cut down. We have now quite a large number of registered Holsteins around us. They seem to sell well, and at reasonable prices there is always a market.

Orwell, O. W. H. P.

The hay crop in my immediate vicinity was very large, but I hear it was below the average in many places. The crop was put in good condition although the weather was very uncertain. The outlook for the oat crop is exceedingly bad. Although the crop promised to be very heavy the weather has been so uncertain and rainy that many farmers have not been able to bring their crop from the fields since cutting, and in many fields the oats are beginning to grow in the bundles. I do not know how widespread this wet weather has been, but if it is very extensive I believe oats will be a very expensive feed this Winter. Corn bids fair to be a very good crop, and the farmers in this district will not lack for fine silage unless the crop is spoiled by an early frost. Potatoes are looking well and a fine crop is expected. Milk is selling at $1.40 per hundred this month. The prices for the coming six months will appear soon and they are expected to be higher than those of the corresponding time last year. Both beef and dairy cattle are selling well. Beef cattle run from $50 to $65 per head and milch cows from $75 to $100 per head. Grain rose a little a short time ago, but is steady at present.

Bainbridge, N. Y. C. P.

August 31.—The dairy business in Southern Missouri is on a firm basis and growing. All the milk on the Iron Mountain R. R. goes as milk to St. Louis. Southwestern Missouri puts it into cream. The future for the dairy interest in Southern Missouri is very encouraging; in fact it is better adapted for that than grain. Cows have been shipped out for the last two years, on account of drought, so that there will be a shortage of cows in the Spring, and I expect good ones will bring a good price. Just now they are down to bed rock, as Southeastern Missouri, Southern Illinois and Northeastern Arkansas have had almost a total failure in corn, meadows, oats and pastures. This drought has hit us harder than the drought of 1891, as there is no surplus left over from last year. Last Spring cows sold at $40 to $100. According to quality, and today ordinary cows go at $30 to $40. Of course good cows would bring more. I do not think that there are many cows for sale that you would call good. W. R.

Potosi, Mo.

The Prosperous Farmer is the Wise Feeder

If you do not yet know the economical result of feeding Xtra-vim Feed, you should find out about it right away.

Xtra-vim Feed is Pure Porto Rican Cane Molasses in Dry Form. Molasses has long been recognized as a most valuable feed. Xtra-vim probably has no equal among foods as a combination of nutrition, palatability, energy-production and economy. Because Xtra-vim is dry, it is easy to handle, is not sticky, does not muss up the stable nor the animal and is not an attractor of flies.

It is dried and concentrated with a small percentage of sphagnum moss which has a remarkably good effect on digestive action and intestinal health.

XTRA-VIM FEED

in 100-lb. bags

differs greatly from beet molasses products. The cane molasses in Xtra-vim Feed has no excess potash salts, has a higher percentage of sugar content, is pleasant to taste and has an appetizing odor. Furthermore, it has not the laxative action which forms so strong an objection to other molasses rations.

Xtra-vim Feed is an American Product and pays no import duty. We transport our molasses from the Porto Rican plantations to our Boston storage tanks in bulk. There's no expense for barrels, nor loss from leakage and sticking.

Xtra-vim Feed is a high-grade, 100%-value feed (containing no cheap "filler") at an unusually low price. It replaces war-priced grains and feeds, aids the digestion of the whole ration and helps keep the animal in first-class condition.

Demonstrate Xtra-vim Feed by using it as a part of the daily ration of some of your stock. A short trial will prove our claims.

Place an order with your dealer or direct with us, if your dealer happens not to carry Xtra-vim.

Xtra-vim Feed probably costs less than you think for such a high-grade concentrate. Its economical results will surprise you.

The Henyard.

Colds and Roup in Fowls.

THE season of the year is approaching when cold rains and equally cold, raw winds will bring about catarrhal attacks in fowls exposed to their influence. Many newly constructed poultry houses will not be finished in time to get their interiors dry and their occupants housed before the raw chill of November has penetrated the bones of the feathered folk now roosting in trees and open sheds and before the delicate mucous membranes lining the air passages and eyes of these pullets and cockerels have succumbed to the catarrhal attacks to which they are so subject. A mucous membrane is a membrane lining one of the body cavities which opens to the outside world, and catarrh is inflammation of one of these membranes. This inflammation may be brought about by exposure to irritating dust or vapors or by the action of certain disease germs or, still more frequently, by exposure to cold and wet until the body is chilled and the natural resistance of its tissues is lowered below the safety point.

The symptoms of catarrh of the air passages of fowls are very like those of "colds" in humans. The fowls sneeze; their eyes and nose run with a thin watery discharge; their heads droop; their feathers are ruffled as easily as those of a human with a hard cold and they wear the same air of dejected miserableness. In very severe cases, these symptoms increase in severity, the discharge becomes thickened, the eyelids are glued together, breathing is difficult and through the mouth and accompanied by wheezing, a thin discharge may come from the mouth and the bird dies from exhaustion. Roup resembles a very severe case of catarrh in its symptoms and it is sometimes difficult to distinguish between them. Catarrh may, and often does, precede roup, so that the latter disease is grafted upon the first. True roup, however, has a specific cause of its own in the nature of a disease germ which germ may be transferred from one fowl and from one flock to another. It is accordingly a contagious disease. This germ of roup is found in the discharges of a roupy fowl and is easily transferred by contact or through the common use of eating and drinking utensils to healthy ones. If the resistance of the healthy fowls has been lowered by an attack of simple catarrh or by underfeeding and unwholesome surroundings they are all the more likely to succumb to the attack of the roup germs. In addition to the greater severity of the catarrhal symptoms in roup there is frequently a peculiarly disagreeable odor accompanying the discharges, the mucous membranes become ulcerated, the eyeballs are almost crowded from the head by the accumulated, thick, secretion and breathing becomes exceedingly difficult. This later stage of the disease is quickly followed by death.

The treatment of simple catarrh, or colds, in fowls consists chiefly in placing the birds in dry warm quarters where they will not be subject to drafts while on the perches and in adding some simple disinfectant, like permanganate of potash, to their drinking water. About one teaspoonful of the crystals of this drug to the quart of water makes a sufficiently strong solution. The fowls should not be housed in a tight, unventilated building but in one which is kept dry by free circulation of pure air. Buildings of the open front type are the best. When the fowls are placed under favorable conditions, ordinary colds are usually quickly recovered from.

True roup is a much more serious matter and requires vigorous treatment to rid the flock and the premises of its germs. Diseased fowls should be promptly isolated or killed and their carcasses burned or deeply buried. It is not worth while to attempt to cure a fowl with true roup; if cured, it is likely to remain unprofitable and a possible source of contagion to other members of the flock.

All utensils used by the flock in which roup has appeared must be frequently disinfected, as by boiling water, and the building should be thoroughly whitewashed with lime wash to which four ounces of crude carbolic acid to the gallon has been added. Individual treatment, if attempted, may be by syringing out the nostrils and eyes with mild disinfectant solutions like permanganate of potash, a grain to the ounce of water, boric acid solution, fifteen grains to the ounce or peroxide of hydrogen. A few drops of kerosene in each nostril and the cleft of the palate is often used in mild cases. The bunches which form below the eyes may be opened with a sharp blade, their contents pressed out and the cavity filled with some antiseptic powder like aristol or iodoform. While even severe colds may be profitably treated individually if the fowls are of sufficient value, when true roup makes its appearance it is better to use the axe freely and depend upon general cleanliness and thorough disinfection to eradicate the disease. M. B. D.

Feeding Milk to Hens.

CONCERNING the feeding of milk to chickens, for the past three years we have fed from 600 to 1,000 Leghorn hens. During all this time they have had from 12 to 24 gallons of milk and buttermilk daily. Our method has been to feed a wet mash at noon of ground grain, bran and middlings, this wetted well with milk which takes about half of the milk, and the remainder of the milk is given the chickens to drink. Our egg yield has been good, averaging between 140 and 150 eggs per hen last year for the whole flock, with the hens of all ages from one year old to four years old. But our loss of hens has been too heavy, being 170 during the year. The largest loss has been in two ways; some would become inactive, lose appetite and finally dwindle away. Others, large strong, healthy-looking, would die within a few hours' time sometimes with half-filled crops, just almost drop dead on the roosts or in the lots. We have often opened these hens and invariably found an exceedingly large liver and gall. We had wondered whether the wet mash had anything to do with this, and this season our young birds are being brought up with a dry mash before them so that we can form our own conclusions from results with this lot of pullets. We are near a creamery where we can buy buttermilk at 1 and one-third cents per gallon. When a 10-gallon can of buttermilk sets a few hours (this time varies as to sourness of cream and temperature), we can pour off from one-third to two-fifths which is like whey or water. The question is, is this really water used in the churning, or is it whey from the cream, or is it both and of what proportion? Another question, what is the food value for chickens of both buttermilk and skimmed milk as compared with best grades of beef scrap or fish, meat or meal.

California. W. H. M

Milk and its products are considered to be of great benefit to old as well as young chickens. Probably the trouble in this flock has been due to heavy feeding. The average given, of 140 to 150 eggs a year for such a mixed flock, is extraordinary. Undoubtedly this method of feeding has produced the eggs, but proved a heavy drain on the fowls' vitality. The feeding of wet mash requires much more care and attention than other methods. If W. H. M. wishes to continue this way he should be careful not to feed his breeding flock the wet mash. Let him push his pullets this way as far as he can without too great a mortality, but every Fall he should select his next year's breeders from among his most vigorous old hens, and allow them to regain their vigor and rest up so that when Spring comes they will be in that condition to reproduce strong germs and quick growing, vigorous chicks. Personally I would strongly recommend that he introduce the dry mash method of feeding with about 10 per cent. meat scrap in the mash, and give the buttermilk or sour skim-milk to them to drink. I am sure he will get good results in egg production

The watery portion which can be found in the buttermilk is whey, and analyzes from four to seven per cent. dry matter, of which less than one per cent. is digestible protein, and the balance, digestible carbohydrates. Skim-milk has about 3 per cent. digestible protein and buttermilk about 4 per cent. compared with meat scrap, with from 40 to 55 per cent. There is something else, however, in the milk products that the chemists have not explained, that seems to have a decidedly good effect on young chickens. It may be that in the sour form the lactic acid is responsible, or perhaps the protein is in a form that readily builds up the chick's body. All authorities agree that skim-milk or buttermilk are most excellent for young chickens and fine for laying hens.

With 50 per cent. meat scrap costing $2.50 per hundred pounds the protein costs five cents per pound. With three per cent. protein in skim-milk we should pay about 15 cents per hundred for it if we are going to get the protein as cheaply. As I said, poultry experts are yearly valuing skim-milk more highly as a feed. I think most will agree that it should be purchased for 50 cents a hundred at most. If I could not get it for less, however, I should be willing to pay $1.50 per hundred for feeding young chicks, and I should always give it to them in a thick clabbered form. A. L. C.

Guinea Pigs and Rats.

IS it true that guinea pigs will drive rats away from a poultry house?

B. K.

I can answer this question with absolute certainty that no one can prove my answer incorrect. Guinea pigs positively will not drive away rats. Rats will kill and eat guinea pigs until about half grown, and are very fond of living with the grown pigs and sleeping among them, if they have the chance. No doubt somebody, sometime heard of some animal that could be let out to drive rats, and forgot just what it was and said it was a guinea pig. And with the astonishing tenacity with which an error survives in the public mind the story went from mouth to mouth, and as guinea pigs are more often seen by people unfamiliar with small animals than are ferrets, and as few people know for what they are used, they recall having heard they drive rats, and so go on thinking it is true and tell others. A. E. C. LATHROP.

Now is the Time Your Hens Need a Tonic

Moulting weakens a hen—it brings her vitality down to low ebb. To help the hen over this period you ought to feed her a tonic to keep her system vigorous, well able to force out the old quills, grow a new feather crop and get back on the job laying eggs well before the winter sets in. Keep your hens toned up.

What your hens need right now is Dr. Hess Poultry Pan-a-ce-a. This splendid tonic is the result of my lifetime experience as a doctor of veterinary science, a doctor of medicine and a successful poultry raiser. It tones up the dormant egg organs, offsets the weakening effects of moulting, quickens quill shedding, makes for a new feather growth and makes hens lay.

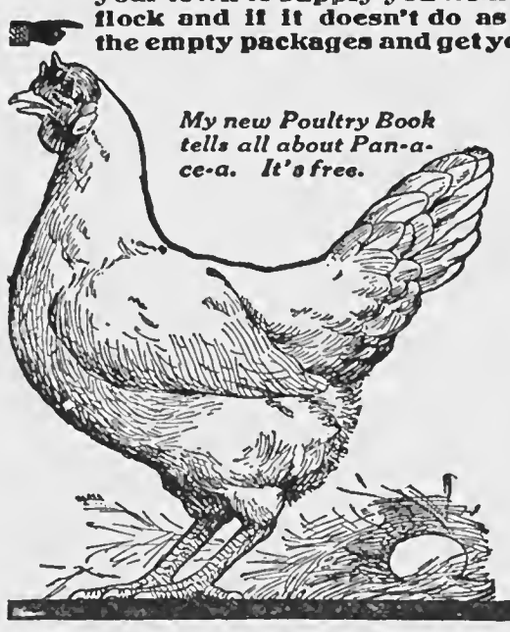
Dr. Hess Poultry Pan-a-ce-a

Not a Stimulant, but a Tonic

Shortens Moulting Period—Makes Hens Lay

This is also a splendid tonic for fattening poultry for market. It helps the birds digest the maximum amount of their ration and convert it into flesh. It keeps poultry healthy and fit while cooped up. Besides, my Poultry Pan-a-ce-a is an excellent constitutional remedy for roup.

So sure am I that Dr. Hess Poultry Pan-a-ce-a will make your poultry healthy, make hens lay, help chicks grow and shorten the moulting period, that I have authorized my dealer in your town to supply you with enough for your flock and if it doesn't do as I claim, return the empty packages and get your money back.



Sold only by reputable dealers whom you know, never by peddlers.

Buy On My Money-Back Guarantee

1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West. Pan-a-ce-a costs only 1c per day for thirty fowl.

Dr. Hess Stock Tonic

Taken off pasture, put on dry feed and closely confined, your stock are apt to get out of fix during winter. Some are liable to get constipation, dropsicalswellings, stocky legs, but most common and dreaded of all diseases, especially among hogs, is worms—worms. Dr. Hess Stock Tonic will keep your stock toned up, enrich their blood, keep their bowels regular and will rid them of worms. 25-lb. pail $1.60; 100-lb. sack $5.00. Smaller packages as low as 50c. Except in Canada, the far West and the South.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or keep it in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 60c. Except in Canada and the far West. I guarantee it.

MACKENSEN, Naturalist, Department 10, Yardley, Pa.

The Henyard.

THE EGG-LAYING CONTEST.

THE feature of this, the forty-fourth week, is the decided drop in egg production. Only 2,238 eggs were laid, as against 2,866 the previous week. This is a drop of 528 eggs in one week. But there have been some exceedingly hot days. Here on this breezy Willington Hill, the thermometer marked 90 degrees on the north side of the house, and the hens stood around with open mouths and wings held out from the body, panting for breath. The heat does seem to affect my home flock of Leghorns, as to egg production; they are averaging about 60 per cent, and the pen of English Leghorns laid 90.9 per cent. one day; 10 eggs from 11 birds. This pen lays 6, 7, 8 eggs a day, sometimes eight for two or three successive days.

At the contest all the breeds were concerned in this loss of egg production, the Leghorns being responsible for a loss of 285, or more than half of the loss. For the first time in many weeks no pen scored as high as 50. The highest number laid was 47; Francis F. Lincoln's White Leghorns tieing with A. B. Brundage's S. C. Reds, with that number. Merrythought Farm's White Wyandottes laid 46. The high totals are:

Storrs pen No. 42, White Leghorns	1,881
F. F. Lincoln's White Leghorns...	1,864
Tom Barron's White Wyandottes..	1,835
Tom Barron's White Leghorns....	1,775

GEO. A. COSGROVE.

Chicks Shedding Feathers.

CAN you tell me why young stock shed their feathers? The chicks are from three to four months old, vigorous and have free range. I am feeding a grain ration of oats, wheat and corn, and there is a dry mash before them all the time composed of bran, middlings, cornmeal and beef scraps. Every morning when I clean out the colony houses the dropping boards are covered with feathers. I have raised chicks for several years, and this is my first experience of this kind. A. E.

New Hampshire.

These are doubtless their baby feathers that the chicks are molting and the process need cause no uneasiness on their owner's part. Like milk teeth, the first feathers have to be discarded to make room for the dress of maturity and the ground underneath the perches of a flock of growing chickens sometimes looks in the morning as if a snowfall had occurred. M. B. D.

Laying House.

I WISH to build a henhouse for 200 White Leghorn pullets for laying. I wish to keep them in the house all the time. What size of building would you advise me to use? M. A. A.

Staten Island.

If you intend to keep your fowls confined to the house all the time, you should give them more floor space than would be required if they had the liberty of a run. From three to four square feet of floor space is usually considered essential for each fowl as they are ordinarily kept and may be increased to any extent that you feel inclined to pay for. The more room they have the better. Do not make the mistake of building a henhouse very narrow and long; a depth of 16 to 20 feet is none too much, with such length as is required to give the necessary floor area. M. B. D.

Breeding for Eggs.

I HAVE a flock of about 40 S. C. W. Leghorn hens which are very good layers. These two-year old hens were mated to the sons of a male which was purchased from a well-known breeder. Which should I do, mate the best of these hens and this year's pullets to their sons and brothers, or send to this same breeder and get another male so they will not be related? I am breeding to fill the egg basket with fancy large white eggs.

New York. G. D. G.

Using the males of your own flock in next year's breeding pen would be inbreeding, but so would be the use of a male from the flock of the original owner of your strain, only not so closely. There is no objection to either plan, provided that you select your breeding pens from the most vigorous and well-developed birds of the type that you wish to perpetuate. To breed for increased egg production it is necessary to use males from the highest producing hens, this characteristic being transmitted through the male rather than through the female line. There is no way of knowing which your best layers are without trap-nesting, though close observation will reveal certain characteristics which accompany good laying and help in selection where trap-nests are not used. For the ordinary, non-professional, poultryman who cannot trap-nest selection will necessarily be confined to egg type, in so far as it can be ascertained, and to size, vigor and such superiority in prolificacy as it is possible to recognize from observation. Inbreeding in itself need not be feared if such selection is made. M. B. D.

Indian Runners in Large Flocks.

DO you know of anyone keeping large flocks of Indian Runner ducks? How many may be kept together? I have done well with six, but I do not see why more would not pay as well. W. J.

New York.

Theoretically there is no limit to the number of Runner ducks that one may keep, but it is not advisable to keep more than 30 or 40 in one pen or yard. Ducks are very timid birds, and when frightened, especially at night, they are inclined to "mill," that is, run around in a circle, and many are killed. One drake should be supplied to six or seven ducks.

W. H. H.

A GOOD WORD FOR BATS.—If L. S. will drive out the bats and screen all openings to his attic he will have no further trouble. Around here we never kill a bat, as they catch so many mosquitoes and other night flying bugs that we think of them as friends, and have never been troubled by their getting into the house. P. A. H. expresses himself strongly against the cat. I wonder if he keeps a dog? A good mouser is just as valuable as a good watchdog, and eats far less. I have no use for the parlor brand of cats, nor lap dogs, but think that some cats are very useful. M. H. S.

Harding, Mass.

A SUBURBAN minister, during his discourse one Sunday morning said: "In each blade of grass there is a sermon." The following day one of his flock discovered the good man pushing a lawn-mower about, and paused to say: "Well, parson, I'm glad to see you engaged in cutting your sermons short."—Philadelphia Public Ledger.

Lowest Prices Ever Made on World's Best Roofing

Lightning-proof, Fire-proof, Rust-proof, Rot-proof, Galvanized Steel Roofing Lasts as Long as Building Stands

Once you have purchased and laid Edwards Tightcote Galvanized Steel Roofing your roofing expense for that building is at an end. Its cost per square is the lowest ever made. It has no upkeep cost. Always beautiful in appearance. Reducing cost of fire insurance.

Reo Cluster Steel Shingles

EDWARDS Exclusive Tightcote Process

Makes Rust-Proof Roofing. The zinc spelter becomes practically one piece with the steel. No ordinary galvanizing can compare with it. Each and every Edwards Metal Shingle, Metal Spanish Tile, each sheet of Edwards Reo Steel Shingle, Grip-Lock Roofing, Pressed Standing Seam or Roll Roofing, Ceiling, Siding, etc., is dipped in a bath of molten zinc, one at a time after the metal has been stamped and resquared. The edges are galvanized as heavily as the sides. Not the space of a pin-point on the steel is exposed to the weather.

Spanish Metal Tile

Edwards Pat. "Grip Lock"

How To Test Galvanizing

Take a piece of any other galvanized steel, bend it back and forth several times, hammering it down each time. You will then be able to flake off great scales of the galvanizing with your finger nail. Apply this test to a piece of Edwards Tightcote Galvanized Steel Roofing—you'll find no flaking.

Corrugated

EDWARDS Patent Interlocking Device

Prevents Warping, Buckling or Breaking. Protects Nail Holes. Roof never warps, buckles or breaks—nails are driven through the *under* layer not exposed to weather—cannot rust. No special tools or experience needed to lay EDWARDS Galvanized Steel Roofing; anyone can do the work—lay over old shingles if you wish.

Brick Siding

Reo Steel Shingles

Cost Less, Outwear 3 Ordinary Roofs and are your joy and pride forever. No matter what kind of a building you have in mind there is a style of EDWARDS *Tightcote Galvanized Roofing* exactly suited to your needs.

PUBLISHER'S DESK

YOU may wonder what I, a principal of schools, am doing as a yearly subscriber to your paper. I would like to tell you that in all the nine or 10 periodicals that visit our home monthly, weekly or daily, none receives a warmer welcome. Also that among them all there is none that bring us more real usefulness and pleasure. One of the big points conducive to our pleasure is the fact we feel assured that news or advertisements we find in it are not rumors but truth.

New Jersey. R. L. P.

No paper of any class enjoys a more intelligent, cultured or distinguished class of readers than THE R. N.-Y. Teachers, lawyers, doctors, statesmen and distinguished jurists are among its steady patrons. We not only have legislators and executives of this country, but patrons among the crowned heads of Europe and Asia, yet the fondest ambition of the paper is to be a real service to the farmer, no matter what his position, in those things, which a paper may be helpful. The favored and powerful are able to help themselves, and naturally it would seem that the service would fall more to a class who were unable to protect themselves. For a large part it does. But to be efficient this service has to be reliable. This does not imply that there could never be a mistake. No one expects human perfection; but it does require that the purpose be sincere, and truth the ideal. We realize now what we candidly did not anticipate at the beginning, that an honest service to the working farmer, embraces principles and functions that appeal to all men with an interest in agriculture. So that in an effort to serve where a paper could be most helpful, we receive reward and support from those who need service less, but who have learned to appreciate the human element in the affairs of mankind.

By reading the letters in your issue of August 29, I see that I am not the only one that got "let down" by dealing with R. J. Gibbins of Mt. Holly, N. J. Having seen his advertisement advertising White Wyandottes at $8 per dozen, on August 4, I ordered six pullets, which I received August 16. They were a sorry looking sight. Three had plumage belonging to Barred Rocks; four single combs and white shanks which resemble White Orpingtons; and one had a partially red back and wings. W. L. T.

Ohio.

The above letter is corroborating evidence of the complaints of the two readers published in our issue of August 29. Further comment on Mr. Gibbins' stock or his business methods seem unnecessary.

The case of D. B. Cornell, real estate broker, charged with false pretenses, was brought up in the district court in Great Barrington today. The case was dismissed. The case was brought by True S. James, a New York actor, who purchased a farm in Austerlitz, N. Y., from Mr. Cornell. Mr. Cornell held a mortgage on the farm and was about to foreclose when the criminal action was brought against him. The court stated that the action was not a proper one for a criminal court.—Local Paper.

We are glad to give Mr. Cornell the benefit of the above statement in which it appears he was released from the criminal charge, as reported in this column on August 22. The report would indicate that redress for the alleged fraud should be obtained in the civil instead of the criminal courts. Aside from the alleged deception on the buyer in this case we have numerous reports from farmers to the effect that the D. B. Cornell Co., Great Barrington, Mass., is sending agents through the country inducing farm owners to pay an advance fee for listing their property. This was the scheme worked by Ostrander of Philadelphia a number of years ago. A number of real estate concerns have made use of the scheme since in some veiled form or other; but Cornell seems to be the only agent so far as we know to appropriate the plan in all its nakedness. R. N.-Y readers who are approached by realty agents are in no danger of taking any Ostrander variety of sucker bait and they can do their neighbors a service by warning them against its allurements.

WATERTOWN, N. Y., Sept. 2.—Max M. Hart of New York, a promoter and speculator with a criminal record, was sentenced today to serve five years in the Federal prison at Atlanta, Ga., for fraudulently using the mails in connection with the Oneida Milling Company. Adolph Wupperman, also of New York, a business associate of Hart, was fined $2,500. Andrew S. Work of Chicago and Frank M. Fowler of Oneida were released under suspended sentences. In addition to the prison sentence Hart, who has figured in many shady transactions, was fined $1,500. He and Wupperman have appealed. The Grand Jury has indicted Wupperman, Arthur L. Fuber of New York and William Trimborn and Mortimer Bartlett, private detectives of New York, accusing them of having tampered with the jury that tried Hart and the others. The charge of jury tampering was made on July 18 to Federal Judge George W. Ray. Hart denied knowledge of this, but Judge Ray ordered him locked up during the trial.—Local Paper.

This Oneida Milling Co. scheme bore all the earmarks of the "get-rich-quick" promoter. In the first place the prospectus promised 7% interest *guaranteed.* A bonus of common was offered with the preferred, which it was represented would bring the earnings on the investment up to 10%. Then every investor could buy his flour or feed at a discount. This is the inducement that catches the largest number. It is an old game that has been worked by professional stock promoters as long as we have known about their schemes. If the subscribers who asked our advice, at the time this stock was being boomed, were guided by it, they are to be congratulated on having escaped the wiles of these swindlers.

"But where are the women?" Here I am, if you please, running so hard I'm all out of breath! It is such an unusual thing that woman should be included when favors are granted, that the poor dear naturally stays in the background! Yes, sir, please put my name down on that list to discourage dishonest business concerns. Well, I'll just hang around your desk till it's done. Here are my reasons: I lost $150 through an advertisement in a farm journal six years ago, and it is pretty tough for a poor schoolmarm to lose money. (MISS) L. F.

We regret the reason that inspired this membership in the Anti-Fake Club; but we rejoice to have it. This seems to be the first membership registered by women, but ultimately we expect that they will equal or outnumber the men. No matter whether the fraud on a family comes through her own transactions or through the men, the woman of the household usually suffers from the loss. She is therefore interested in any case; but often the deception is directed directly to her. Of the estimated ten or twelve millions collected and squandered by E. G. Lewis, the larger portion of it seems to have been contributed by women, and few of them ever have or ever will get back a cent. However unusual it may be for her to be asked to share in the favors that are passed around she is certainly not slighted when gold-brick allurements are on the table. The average women have been even more helpless than men because their experience and field of activities have been more limited, and they have not had the information that would enable them to recognize deception in the schemes worked out to deceive them. This club membership will give them the information required and we have every confidence that they will eagerly avail themselves of it. Come, ladies, send in your names for membership in the Anti-Fake Club.

Last Fall I saw the advertisement of J. R. Cain, Washington, Pa., in another publication, and sent him an order for a dog, paying $25 for him. The dog I received did not correspond with the description in the advertisement. The dog was 17 pounds lighter in weight and while I ordered a male I received a female. The dog sent was entirely worthless. I have written Mr. Cain two or three times and fail to receive any reply to my letters. If you can get any satisfaction for me, I shall appreciate it. E. A. F.

New York.

Our letters in the subscriber's behalf were also ignored by Mr. Cain, and the record in the transaction is not one that would encourage others to entrust this party with dog orders. We hope that Mr. Cain may not be a reader of THE R. N.-Y., but perhaps some of his neighbors may bring to his attention the record, in cold type, he made in the transaction.

I shipped to Harrington & Co., 170 Summer Street, Boston, Mass., one cow hide which was delivered and signed for, but I cannot get them to pay for it. I wish you would see what you can do for me, as I see from your paper you bring lots of them to time. The hide was worth $4.58 according to the record on their book, which was shown me by their bookkeeper when I called. D. W. H.

Massachusetts.

We were unable to get any redress whatever from this firm, but it is reported that they do not have an office at the address any longer but call there for the mail. The inference for other shippers is obvious; but all such cases should be reported by the shipper to the post office department at Washington, D. C.

The check arrived this morning in payment of claim against Adams Express for the lost case of eggs, that you so kindly had adjusted for me. It was quick work—less than a week, while I have waited since January. Thank you very much. In return I shall try to steer some subscribers your way as soon as possible.

New Jersey. C. G. W.

The subscriber had never received even an acknowledgment of this claim until he received the remittance, after our filing of the complaint.

Questions About Pigeons.

I HAVE about 100 pigeons in a wire enclosure which is about 100 feet long, 50 feet wide and about 30 feet high, with a house for them in the centre which is about 15 feet square and about same in height, with any amount of nesting places. I feed them with a mixture of four quarts of cracked corn, rye, buckwheat and a little oats; the latter they do not eat. They are not producing a satisfactory number of squabs, maybe getting 60 in the course of a year. I cannot tell a male from a female. Is it necessary to have as many males as females? How can they be distinguished? How many should a pair produce in a year? How long is a pair useful for production? Will they lay the first year? What kind of food is necessary? How much would you feed per 100 birds? The yard is seeded down to grass, and they have plenty of fresh, running water and shells.

Massachusetts. J. M.

The wire enclosure you have for your pigeons is satisfactory, the house is large enough, your feed mixture should be changed some and the pigeons should be mated male to female in every case. A pair of satisfactory breeding pigeons should give you six or eight pairs of squabs per year. The usefulness for breeding purposes of a pair of pigeons is from four to eight years. Pigeons will lay and produce young their first year. In feeding pigeons they should be supplied with all that they will eat readily of a mixture something like this, equal parts of whole hard wheat, small size whole corn and Canada field peas. Once a week a little millet and a little hemp seed may be given them. Charcoal and ground oyster shell should be provided for them in a small dish. The house should be well ventilated and kept as free from vermin as possible. The greatest amount of work in producing squabs (young pigeons), is to keep the old birds mated and breeding. It is quite difficult to distinguish males from females until one has become quite used to the characteristics actions and appearance. A good way for you to do with your pigeons is to place them in small, temporary quarters, where they can be watched and as soon as a male is found driving a female, that is, following her around and giving every appearance of courting her, it may be assured that they are mated and they should then be placed in their permanent quarters. They will need considerable watching, but in time you will be able to find the greater part of them mated and transferred. With young birds that do not seem to mate readily you should have small wire cages made about two feet long and one foot wide, divided in the middle with wire. By placing in such cages two birds, one in either end, you can soon tell whether they are male and female and whether they will mate or not. Pigeons, like eagles, mate for life, and when once they become attached to each other, seldom give up their mates. A. L. C.

When you write advertisers mention The Rural New-Yorker and you'll get a quick reply and a "square deal." See guarantee editorial page.

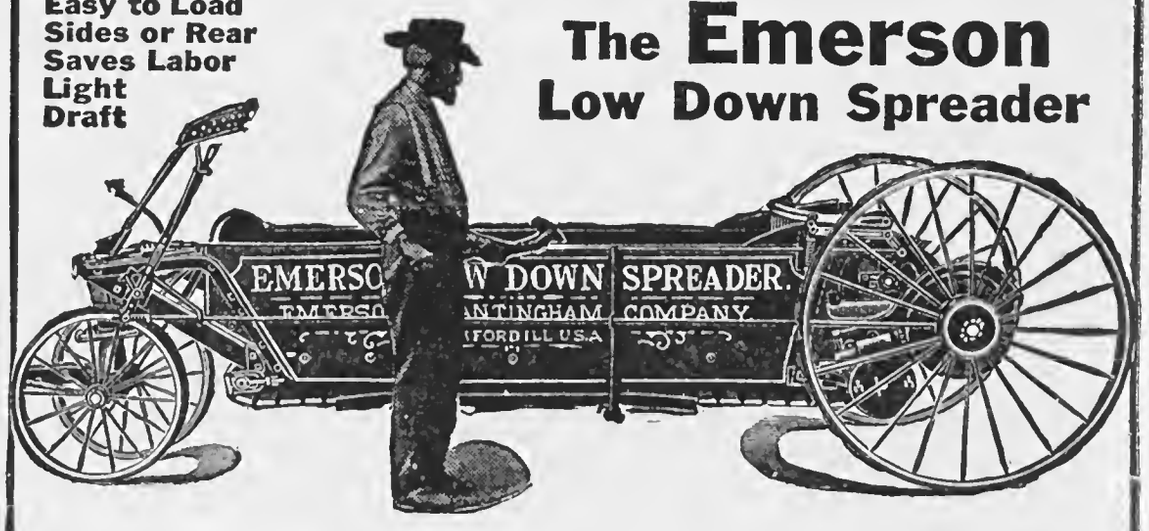
The Emerson Low Down Spreader



YOU put manure on the farm to furnish plant food for the growing crops. The more thoroughly pulverized and nearer plant food form this manure is applied the less atmospheric waste and better results. The Emerson Spreader actually pulverizes and applies the manure in more available plant food form than any other low down spreader.

Send for Book of Spreader Facts Tells all about Emerson construction and describes all special features. Every farmer should have a copy of this book. Send your name and address for free illustrated book.

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending Sept. 11, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914.	1913.
April	$1.40	$1.50
May	1.50	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.10 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.61 and $1.51 for B and C. Hotels and restaurants using two to three cans per day are paying five to 5¼ cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

Some improvement in quality of the current make is noted. There has been an advance of one-half cent on the highest grades, but business is not active at this figure. Receipts of seconds and lower grades are large and selling slowly. There is some call for storage creamery at nearly the top price for fresh goods.

Creamery, extra, lb	32	@	32½
Good to Choice	26	@	29
Lower Grades	22	@	25
State Dairy, best	29	@	30
Common to Good	20	@	23

Packing Stock	19	@	22

Elgin, Ill., butter market 30 cents.
Philadelphia, western creamery, 32 cents.

CHEESE.

The market is one-half cent lower and generally unsettled, especially on the lower grades of whole milk.

Whole Milk, fresh, specials	15¾	@	16
Average fancy	15½	@	00
Prime	15	@	15¼
Under grades	11	@	14¾
Daisies	16	@	16¼
Skims, specials	13	@	14
Good to choice	11½	@	12½
Poor to fair	7	@	11

EGGS.

There is a great scarcity of fancy white, which in some cases are selling three cents above last week. Medium and mixed lots of fresh gathered are as a rule held too high for prompt sale and going much more slowly than lower grades used in cooking, for which there is a good demand at 25 cents and under. Closer grading would be profitable to a great many shippers, as it is useless to expect a few choice eggs to bring up the price of lower grades mixed with them. It works just the other way.

White, choice to fancy, large	38	@	40

FRESH FRUITS.

The market is less burdened with inferior apples and the general tone of business better. Choice Fall varieties selling up to $3. Bartlett and Clapp's Favorite pears in good demand, though the latter have to be examined closely for core rot. Peaches selling in a very wide range of prices from 50 cents to $2 per carrier. There has been a heavy surplus of small and medium grade. Plum market firm, up to $1.50 per bushel. Muskmelons running largely poor.

All our crops look well except peaches, which will not be five per cent. of a crop in Niagara County. Apples about an average crop, and plums 50 per cent. It has been so wet and cold it is almost impossible to get our oats dry even by unbinding and spreading out a load or two at a time. H. M. J.

Lockport, N. Y.

MISS FLUFF: "Mr. Deepthought, do you think marriage is a failure?" Mr. Deepthought: "Well, the bride never gets the best man."—Judge.

GOVERNMENT CROP REPORT.

THE Bureau of Statistics gives the following estimated yields of staple crops. The two first columns of figures refer to acreage yields this year and the average of five years previous, and the third to the total production in bushels, pounds, etc., for 1914.

CROP	YIELD 1914	YIELD 1909-1913 Average	1914 Forecast
Wheat—			
Winter	19.1	15.6	675,000,000
Spring	12.2	13.3	221,000,000
All	16.8	14.7	896,000,000
Corn	24.9	25.9	2,598,000,000
Oats	29.1	30.6	1,116,000,000
Barley	26.3	24.3	200,000,000
Rye	16.8	16.1	43,000,000
Buckwheat	21.5	20.5	17,000,000
Potatoes—			
White	98.0	97.1	371,000,000
Sweet	93.0	92.7	55,000,000
Tobacco, lbs.	729.0	815.1	862,000,000
Flax	8.0	7.8	15,000,000
Rice	34.5	33.3	24,000,000
Hay—			
Tame, ton	1.42	1.34	69,000,000
Apples	....	....	220,000,000

Hog Cholera.

MY hogs were infected with cholera last February. It was in a very mild form. Some had sore eyes, very little appetite, and gradually wasted away. They were so different from any cholera that I had seen that I got a veterinarian. After about two weeks of observation and two post mortem examinations he decided it was cholera, so I got rid of every one in May and started in afresh, putting them in a big lot over in pasture, have had no trouble since. When Winter comes I shall have to bring them up to their old quarters. Will the germs still be there? Can I inoculate them with cholera serum and do it myself? Is the serum expensive? L. P. B.

Massachusets.

It will be necessary to immunize the hogs with serum, as the infection will be likely to remain in the infected area and contaminate hogs that have not already had the disease. The dose of immunizing serum, where virus is not to be used and where the disease is not present at the time of vaccination, runs from 10 cubic centimeters for little pigs to 50 or 60 cubic centimeters for a hog weighing over 300 pounds. Hogs weighing 150-200 pounds require 30 cubic centimeters of serum. Where serum is made at the State experiment station and sold at a cost not to exceed that of production it costs about one and one-half cents per cubic centimeters. The writer is not informed as to the cost in your State. Take the matter up at once with the veterinarian of the State experiment station, or with the State veterinarian. The vaccination should be done by a qualified and authorized graduate veterinarian. A. S. A.

Nailprick.

MY family cow ran a small roofing nail in foot about a month ago which was extracted with a pair of pliers. Nothing further was done for it at the time. The cow has been more or less lame ever since, but there is no swelling and very little sensitiveness on pressing and no indication of point of entrance. What is the proper treatment in such a case? O. F. C.

District of Columbia.

The wound in the horn has closed and probably retained pus which should be liberated by cutting; or deep tissues have been injured by the foreign body. Open up the wound and apply a wet dressing of 1-500 solution of bichloride of mercury and absorbent cotton to be renewed daily. There is danger of tetanus in such cases and the opening up of the wound may obviate the attack. A. S. A.

"I HAVE read every book on agriculture that I can find," said the amateur farmer, "and still I don't manage to get crops." "There's the trouble," replied Farmer Corntossel. "You're putting all the cultivation on yourself instead of on the land."—Washington Star.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

MARRIED COUPLE—Want position on farm; can do any work; two children, long experience; best reference; state salary. NESNADNY, Care Dr. Kueher, Riverdale, N. J.

WANTED—Married man for general farm work and to assist with poultry on commercial poultry farm; house, fuel, vegetables and milk supplied; state age, nationality, experience and wages expected. Box 243, St. James, L. I.

WANTED—Young, experienced man on 50-acre farm, Western N. Y.; mostly poultry; few cows; must be good milker and handle team; steady job year round for right one; $25 per month; give references. P. S. L., Care R. N.-Y.

INDUSTRIOUS, competent, married farmer, with grown son, to work on shares, nice Maryland farm, 125 miles of Philadelphia; possession given at early date. Also two smaller places to rent. DR. BELL, Salisbury, Maryland.

WANTED—Position as farm or estate superintendent; practical experience in farming, fruit growing, dairying, poultry, incubators, farm machinery and building construction; experienced carpenter, plumber, etc.; married; best references. N. K., care Rural New-Yorker.

POSITION WANTED—By practical American, aged 30; married and strictly temperate; understands fruit, poultry and dairy farming; also concrete and wood construction. Can handle men without friction. Best of references. Present employer selling out. Box 31, Harrington Park, N. J.

A METHODICAL, practical, scientific and successful general farm and dairy manager covering years of extensive and varied experience in exacting operations, will be open for engagement Sept. 1. Eminent credentials will be furnished and nothing short of a first-class, responsible and remunerative position will be considered. If desirous, might consider cash proposition of lease of entire property. Address T. J. A., care Rural New-Yorker.

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

WANTED—One carload of Alfalfa. ARTHUR CHENEY, Castleton, N. Y.

WILL have a nice bunch of Winter apples for sale, mostly Baldwins. J. S. MILLER, Grantsville, Md.

WANTED—Quantity of high bush cranberry seed. E. A. MORGAN, City National Bank Bldg., Dayton, Ohio.

NEW HONEY—Basswood or clover in sixty-pound cans. Write for prices. C. A. HATCH, Richland Center, Wis.

APPLES, APPLES, APPLES—Choice sprayed Fall and Winter Apples. Please order to-day. C. J. YODER, Grantsville, Md.

FOR SALE—20 acres, 2 grapes, 4 strawberries, balance corn, peanuts and young pine. W. W. ARTHUR, N. Emporia, Va.

FOR SALE—Truck farm, 25 acres; all tools; 8-room house; good markets at seashore; soil light loam. Price $3,750. Write. I. B. HALSTEAD, Belmar, N. J., Route 1.

I WANT to buy or rent, with option of buying, a farm, 20 to 30 acres, in New Jersey, within 100 miles of New York City. What have you to offer? F. S. W., Care R. N.-Y.

FOR SALE—100 acres in Central Ohio; good grain or stock farm; would take live stock as part payment; registered preferred; for description write R. T. LAIRD, Marysville, O.

FOR SALE—85-acre farm near macadam road; five minutes' walk to trolley; good land; good buildings, good orchard; plenty water; price reasonable. H. FREDERICK, Brunswick, Maine.

FOR SALE—Dairy farm 170 acres; good buildings, good water; under good cultivation; keeps 40 head; four miles from village; three from two creameries. JAMES M. BONTON, Roxbury, Del. Co., N. Y.

FOR SALE OR LEASE—Ten acres good land, story and half bungalow; new; heat and water, barn, chicken houses for seven hundred layers. Excellent neighbors, macadamized roads, mile and half to Freehold. ARCHER CROOKS, Freehold, N. J.

NOTICE—A fine farm of 160 acres in Ingham County, Michigan, 5 miles east of the City of Mason, will be sold at public sale on said premises by administrator, pursuant to order of Probate Court of said county Sept. 26th, A. D. 1914, 30 acres of fine timber. MERRITT HICKS, Administrator. Business address, Dansville, Mich.

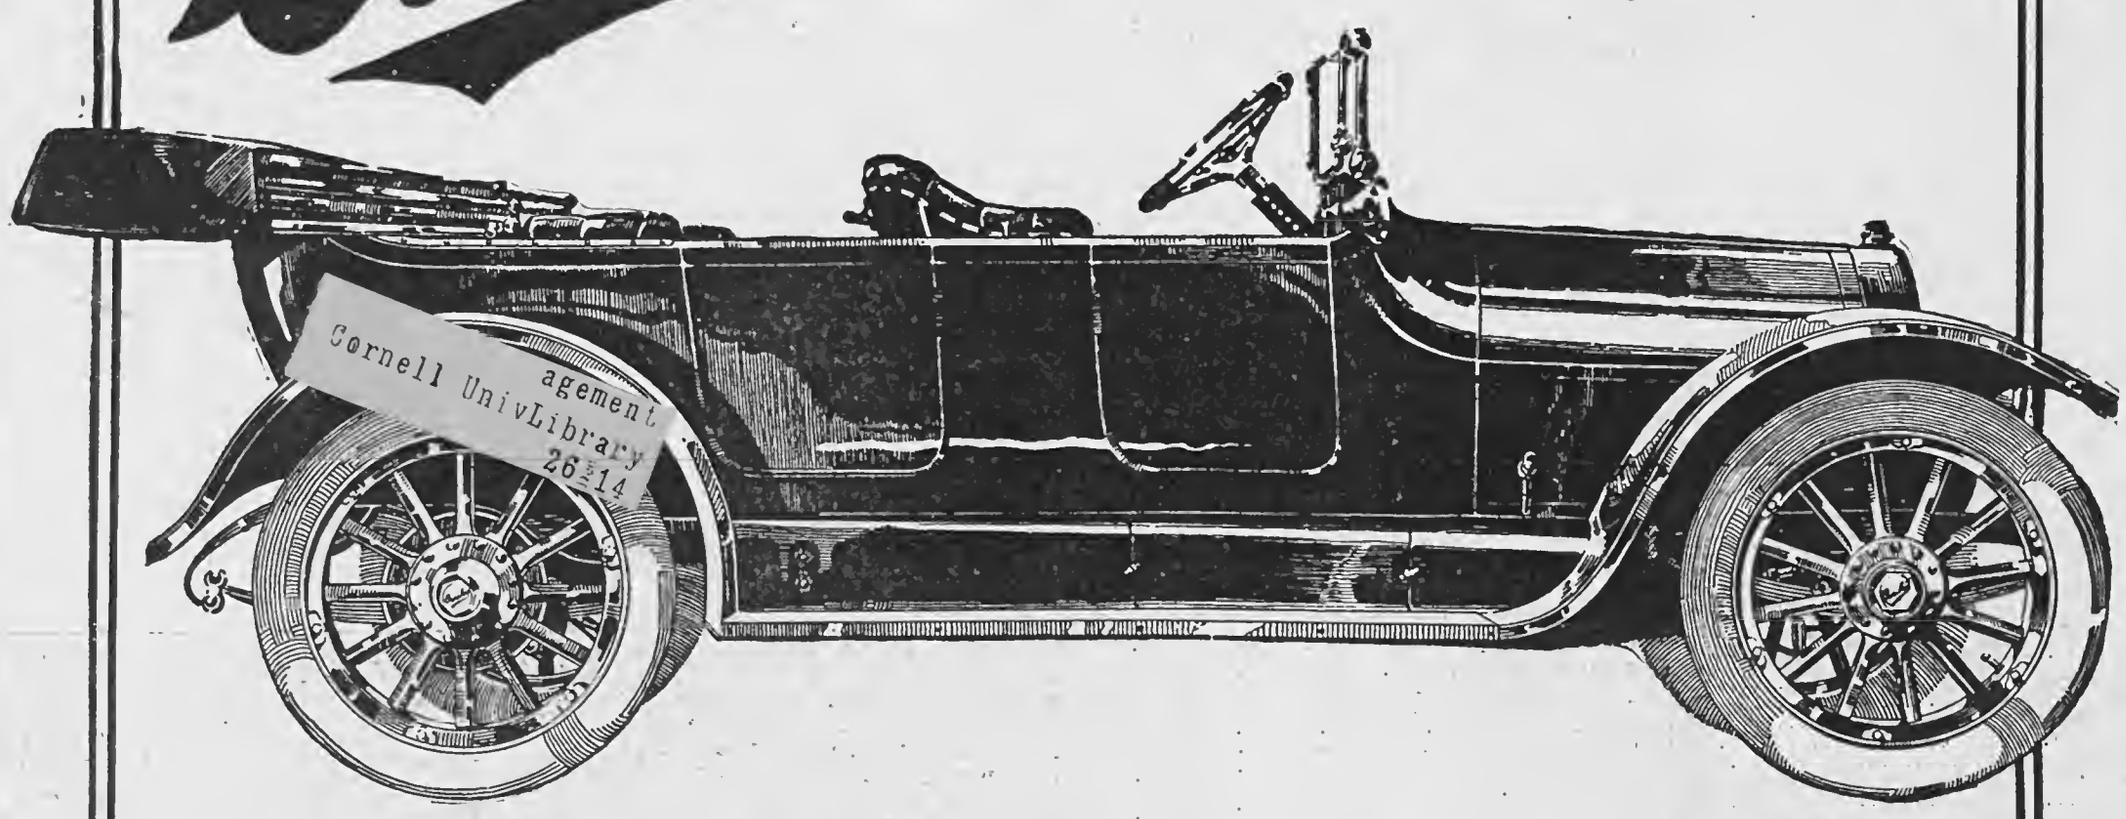
SPLENDID Commercial Apple Orchard, located in the famous Apple and Tomato Belt, Morgan County, West Va., consists of ten thousand trees, ten years old; tomatoes will maintain property. Best of management now on property. Best of reasons for selling. For particulars write immediately. R. R., care Rural New-Yorker.

NEW ENGLAND FARM FOR SALE—To Close Estate—Forty acres cultivated land; eighty acres of pasturage and good apple orchard; high ground; good view; four miles from Atlantic Ocean, in the town of North Stonington, Conn. Modern thirteen-room house and small barn; good water; one and one-half miles from trolley, and near State Road. Address ALLYN L. BROWN, Admr., Norwich, Conn.

WANTED BIG DAIRY FARM—Farm manager, 42 years old, with 2 full grown sons, all wide experience; Dutch nationality; wants dairy farm of at least 30 or more cows, on shares or to rent for cash; also will rent farm and buy stock; must be near big town; opportunity to produce certified milk and build up a retail milk route; very best private and bank references. B. L., Care Rural New-Yorker.

Overland $1075

MODEL 80



agement
Cornell UnivLibrary

The Latest and Greatest Overland of All

Motor 35 h. p.
New full stream-line body
Instrument board in cowl dash
Individual front seats, high backs
Tonneau, longer and wider
Upholstery, deeper and softer
Windshield, rain vision, ventilating type, built-in
Crowned fenders
Electric starter
Electric lights
High-tension magneto
Thermo-syphon cooling
Five-bearing crankshaft
Rear axle, floating type
Springs, rear, 3-4 elliptic, extra long, underslung
Wheel base, 114 inches
Larger tires, 34 inch x 4 inch
Demountable rims—one extra
Left-hand drive
Beautiful Brewster green body finish
Complete equipment

Again we have made expensive improvements, costly enlargements and incorporated numerous, high-priced refinements.

But we have not advanced the price.

The body is brand-new—the full stream-line type, with new crowned fenders, new rounded radiator and new sloping hood.

The electrical equipment is the finest and most reliable we could get.

The rear springs are new—for the 1915 springs are not only improved but are longer and underslung which makes the Overland one of the easiest riding cars in the world.

The luxurious new, softer and deeper cushioned upholstery insures solid comfort at all times.

The tonneau, this year, has all kinds of room being considerably longer and wider.

There is left hand drive and center control.

Larger tires (34" x 4" all around) and the long wheel base of 114 inches mean smooth, jarless riding.

The big, snappy and powerful 35 h. p. Overland motor is regarded and referred to as the world's most highly developed four cylinder power plant.

Demountable rims (with one extra) are another expensive addition.

This car comes complete. Electric starter, electric lights, built-in windshield, mohair top and boot, extra rim, jeweled magnetic speedometer, electric horn, robe rail, foot rest and curtain box.

There does not exist another automobile manufacturer who can give such big value at such a low figure.

If we were not the world's largest producers of this type of car neither could we.

Our dealers are making deliveries now. Get in touch with the nearest one at once. Order your new Overland today.

Handsome 1915 catalogue on request. Please address Dept. **127**

SMALL FARM PROFITS.

Started From the Wife's Experiment.

LAST Spring we had a discussion about the relative profits of small or large farms. One set of farmers claimed that "the little farm well tilled" is best, while others wanted a large piece of ground, so that labor-saving tools, etc., can be used. This discussion reached the eye of Mr. Alfred Fuller, of Cattaraugus Co., N. Y., and he sends his experience with a small place:

GREENHOUSE WORK. — If people on a large farm would put in the same number of hours of hard labor, and practice the same economy and saving that I do with my greenhouse business they would make more than they do. Anyone to work a greenhouse successfully must have perseverance, courage, and bulldog grit. It looks like an easy task when the plants are on the wagon for delivery, but before that time there have been months of hard work, care, and sleepless nights. I will start with my beginning and try to show how the business has developed.

HOW IT BEGAN. — About 40 years ago my wife sowed a package of Acme tomato seed. I do not know by what special reason, but I never saw nicer plants, and people who saw them offered a big price for just one plant. I did not let any go, but I conceived the idea that the next year I would sow more seed and have some plants to sell. I had some lumber sawed, part ⅛-inch and ⅜-inch for boxes, and I had that for my "knitting work." Every time I had a little time I would rip and saw on those boards, and it makes a chill go over me now to think how hard I worked on that box material. At this time I was working on the railroad as sectionhand. I finally cut out stuff for 50 boxes, and made a rack something like a milk rack, and placed it in a sunny window. I sowed my seed and had good success. The plants did not look as they do now, but they answered for the times, and sold readily. The next year I made some hotbeds covered with glass, and some cold frames. After I had worked that way for a few years I took my father's farm with the understanding that I could raise plants if it did not interfere

"GRANDMOTHER'S POSY BED." THE END OF THE SEASON. FIG. 493.

with the farm business. On the farm I made two greenhouses, besides several beds, and worked the farm for 16 years. Then my father died and four years later my mother died; then the farm went into other hands, and I bought the farm of 26 acres where I now reside. Here I have two large greenhouses heated with wood stoves, with pipe going the length of the building. Then I have several large beds covered with canvas.

Until about three years ago I shipped cabbage, tomatoes, celery, peppers and other plants to Buffalo, Olean, Bradford, Eldred and Reading, besides delivering to towns by wagons from six to 15 miles away. My business increased and my age, too, so my son-in-law, who is an operator on the Pennsylvania Railroad, put up an up-to-date greenhouse made of cement blocks, with a perfect system of hot-water heating, and now he raises a large number of boxes of plants and supplies the shipping trade.

SOME OF THE DIFFICULTIES.—So far there does not seem to be anything but success, but there is a mixture of joy and sorrow in most affairs. It is sorrow when you think you have a fine lot of plants and the last thing when you close up at night you can almost count the dollars, and then go out in the morning to find thousands of your beautiful plants damped off. This trouble discourages a great many, and they give up the business. Another trouble is the little black bug that will spoil the looks of the plants in a very short time. There are the wireworm, cutworm, snail, mice, heat and cold; these all destroy, but can be overcome if you have the grit that I spoke of in the beginning. I have had one fire that destroyed some plants. One year, the 30th of May, there was a hard freeze that did considerable damage, and on April 30, 1903, a whirlwind passed over this place. It went between the greenhouses and scooped out the glass from both houses. It turned colder right away, and we had to hustle to get the roofs covered to prevent freezing. One year there was a sudden cold wave, April 19, and before we could guard against it we lost 200 boxes. So it is a constant watch for these different obstacles. One seedsman says all of these difficulties are the plant raisers' friend. If it were not for these troubles everyone could raise his own and there would be no sale for the plants.

PLEASURES OF SUCCESS.—Now comes the joyful part, to get up early on beautiful May and June mornings, hitch a good team, or teams as the case may be, load up our wagons and drive through the country. Fuller's tomato plants are known for miles around, and although I have no patent on the way of raising them, no one has yet raised any like them, unless they have learned of Fuller. My son-in-law and myself raise a good many thousand boxes. We retail the plants at 25 cents per box, one dozen plants in a box, and make a special price to dealers. My largest sale in one day was $40. I kept five Holstein cows when I came to this place, but I have already passed the time alloted to man, so I only keep two cows, 100 White S. C. Leghorn hens, some ducks, three pigs and my team. All of my life I have been a liberal supporter of the Gospel, and I firmly believe this is why I have been so well blessed. I could cite a number of men who have had large farms, or the price of a big farm given them, who are now not worth the clothes they wear, and they have been just living for themselves and their own pleasure. I have always lived a temperate life and never use tobacco. I think if there is anyone worthy of praise for overcoming obstacles and rising from nothing to wealth it is my neighbor, Henry Mathewson. He began just as poor as a boy could be by taking a few calves on a wagon to Buffalo, 40 miles away, and he has built up a business so that he has several large farms in the best kind of condition, a stockholder in a bank, has an auto, gave his son a college course, and is what you could call wealthy, and he knows how he came by every dollar. There must be some brain to succeed on a large or small piece of land. ALFRED FULLER.

THE VACCINATION QUESTION AGAIN.

THROUGHOUT New York State, as well as some others, there has come a renewal of the violent attacks upon vaccination as a preventive of smallpox. This treatment has been accepted by the great majority of people as a necessity. Yet the recurring outbreaks of opposition show that nothing of human knowledge can be so well settled as to defy contradiction. As a contribution to the discussion we print the following from a country doctor:

"My knowledge of smallpox is limited; the old-fashioned malignant type, which, if history doesn't lie about the matter, once devastated the world and annually slaughtered its thousands and made hideous wrecks of other thousands has disappeared from civilized countries. The type which we now see is much modified and can scarcely be classed as a serious disease. If it were not for its terrible possibilities, as shown by its history, no one would fear it. Up to a few years ago I had never seen smallpox, as the great majority of the present generation of physicians never have. One day I was asked to investigate a few cases of "chickenpox," which had occurred in a family living back in the hills a long way from the village, and a considerable distance from neighbors. I visited the family and became satisfied that they were really suffering from smallpox, though I had to depend upon an acquaintance with that disease gained from reading only. My diagnosis raised an uproar, of course, but subsequent events proved it correct. A small epidemic started from those cases, and I saw perhaps 30 cases of the disease within a few weeks. Two or three of the victims were seriously sick, and presented typical pictures of the "real thing"; most of them were only more or less indisposed, however. Many refused to believe that the disease could be smallpox, though so pronounced by the State health authorities. Before we got through with it I became pretty well acquainted with present-day smallpox, and saw some cases that made it easy for me to believe the stories of its old-time malignancy. I also had a good opportunity to observe the protective effects of vaccination, as in one family of four, of which the mother only had been vaccinated, and she in her childhood. The father had a typical case of smallpox of considerable severity; he was a disgusting sight for several weeks. The two children caught it from him and had milder attacks. The mother cared for them all, being at all times in closest contact with the disease, but did not take it. One swallow doesn't make a Summer, of course, but it seems to me that there is no fact better demonstrated than that Jenner's proof of a milkmaid's discovery gave the world a boon the value of which no man can begin to estimate."

BEAR TRAP FOR FRUIT THIEVES.

I HAVE an orchard three miles from a city of 75,000 inhabitants, and a trolley line running within 10 minutes' walk of it. I work in the city, and have to be up at five in the morning, and start for my work at six, returning home at seven at night. In the Summer season I work on my land as long as I can see, and then am tired enough to go to bed, so I cannot sit up and watch my property. There is a class that never has any regular occupation and can lie around and sleep all day, and when night comes are fresh and ready to start out and scour the country for whatever they can find to pick up. Last Fall I had trees completely gathered in a night, and in some cases fine young trees broken down and nearly destroyed by the thieves climbing into them. One day a man to whom I had sold some apples on the trees, started down into the orchard and met 15 young scalawags, each with a bran sack sewed up at both ends and a hole left in the middle in which to fill in the fruit, and then swing them across their shoulders and march off with them. He gave chase and caught one of them, giving him a good drubbing and letting him go. He should have held him and had him taken before a court, but did not think of that. The boy brought no suit for damages, and I rather imagine was mighty glad to get off as easy as he did. Now I am thinking seriously of buying two or three good bear-traps and making use of them this season, and if I do I am pretty sure I will get some good-sized two-legged game. Would I be liable for damages if I caught a good, lusty thief in a padded-jawed trap, so there would be no danger of breaking any limbs or bruising him seriously? Will you tell me what you think of that plan of inducing them to "wait a bit"? Z. C. B.

R. N.-Y.—The danger with this would be in catching some child or innocent person who had no idea of stealing. In our own country groups of children often walk through the woods and fields with women or girls attending them. They have no thought of committing any damage, but if a child or woman were to be caught in such a trap it might mean serious injury. The owner might not be held legally responsible, but the public would be very bitter over such an accident. A padded trap might catch one of the larger thieves, but they usually work in gangs, and his comrades would set him free.

LABOR AND LAND CONTRACTS.

DURING the year we have dozens of questions about arranging contracts between the owner of a piece of land and the tenant or party who works it. Sometimes the tenant furnishes part of the capital—sometimes not, and sometimes the owner does part of the work. There are complications over the contract, and we are asked to help settle. In making such a contract the simplest plan is to assume that real estate, personal property and labor are about equal, and entitled to an equal division of proceeds. This will not be true of all cases, but it is generally a safe rule to start with. If one man furnish the real estate and the other does the work they would, under such an arrangement, each be entitled to one-third. The other third would be divided between them in proportion to the amount of stock, implements, money or other personal property each provided. We do not know of any better foundation principle for basing such a contract. It should be modified to suit conditions of character, labor or methods. For example, here is a case of intensive gardening:

In the case of celery the cost of production and labor is so great that I think the share of proceeds should be smaller to the owner of the land, as the worker furnishes all else. Plants alone are 75 cents per 1,000; fertilizer, 1,000 pounds, $15; nitrate of soda, $6; 10 hours' work every fair day; 5,000 plants growing. On a crop costing as this one does the proceeds should be proportionately greater than its cost to produce over ordinary farm crops. Therefore, if it costs $400 to produce, $100 goes to the land owner, if it sells for $400. If it sells for $1,200 there is $300 for owner of land, which is $150 per acre for its use. With your idea of its use for one-third it would be still greater, which seems unreasonable. I am sure you know of or can find a satisfactory instance to advise me of. W.

Usually we think these questions will settle themselves on this one-third basis. Land suitable for celery is worth more than ordinary farm land, and the labor required to produce $100 worth of celery is not as great as would be the case with $100 worth of wheat or corn. As this contract proposition is complicated by such conditions we would like to have reports of experience showing what parties have actually received under such a division of proceeds.

A SUCCESSFUL FARMERS' CO-OPERATION.

PART III.

INCREASING MEMBERSHIP.—Since the annual report of 1913 was published the membership has been increasing on an average of one member daily, and before 1915, the association is very likely to have 800 or more members. It is only a matter of another year until the entire capital stock of one thousand shares will be sold. The stock is non-assessable and all losses are paid out of the profits of the association. This means that the shipper is never at a direct loss. The membership now covers practically eight townships and the board of directors consists of nine members. In the contracts which the members make with the Association there are four articles that are the foundation of the success of the association. I give them herewith:

"The party of the first part (the member) agrees that the party of the second part (the association) shall be his exclusive agent for the sale of the produce herein mentioned.

"The party of the first part further agrees that he will not contract for the raising and sale, or sell or contract to sell any tomatoes with or to any canner or preserver during the term of this contract. The party of the second part agrees to act as agent for the party of the first part and to receive and sell the said produce at the best obtainable price, either to a cannery or in the open market and to make returns to the first party of the full amount of the net price received for said produce less the commission established by the by-laws of the said second party, within 10 days after the receipt thereof by the party of the second part.

"It is further agreed that all produce marketed at canneries shall conform to the standard and conditions as set forth in the contracts made between said canneries and the party of the second part and that the party of the first part shall grade and pack all produce sold in the open market in such manner as shall be prescribed by the party of the second part."

In two years this Association grew to a membership of 500 members and did a total business of over a quarter of a million dollars. It saved its members over $4,000 on fertilizers. It sold over 15,000 tons of tomatoes at a price of one dollar more per ton than the farmers had been securing before the association was started. It secured better prices, amounting to several thousand dollars, for berries, fruits and vegetables other than tomatoes. Now, 500 farmers invested $2,500 in the stock of a coöperative association. On this investment they saved over $4,000 on fertilizers and received over $20,000 more for produce than they would have done had the association not existed. Practically $25,000 profit on an investment of $2,500 or in percent it means a profit of 1,000 percent in two years, and it means that a $5 investment made a profit of $50 in two years. A record and an achievement to be proud of. The association now has two rooms in the best business block in Silver Creek. Mr. Cook, the manager, to whom can be largely credited its success, was re-elected this year at an increase in salary. Mr. Cockburn was also re-elected president. C. R. BERGER.

THE number of questions sent us as to the wellbeing of favorite rose bushes shows the increasing interest in this queen of the garden. This is especially true as regards climbing varieties.

"SOIL SANITATION" ON A LARGE SCALE.

Experiments in North Dakota.

A FEW weeks ago, on page 1025, we printed the facts about the new proposition of "soil sanitation." Our scientific men now fully understand that many of our wheat lands are well filled with disease germs, so that seed put into them, except under the best of conditions, will be obliged to run the gauntlet, with the chances of being seriously injured. Since this article was printed we have had many letters from people who want to know if it is not possible to disinfect the soil by the use of chemicals, so as to kill these disease germs out. As is well known, market gardeners frequently sterilize the soil of their hotbed or glass houses, either baking it or treating it with live steam. The object of this is to destroy disease germs in that soil, so that their young plants will receive a fair start. The farmers who burn a pile of brush, or build a bonfire on land where they are to plant their cabbage or tobacco seed, have the same purpose in mind. It is possible to sterilize these small tracts of land. Now we have a class of people who think it may be possible to handle acres of wheat land so as to sterilize it fully. One man proposes to have a tank attachment on the plow. This tank is to be filled with a solution of formalin, so that as the land is turned over this solution is sprayed upon the soil. This man asked us to find out for him, if possible, whether such a plan would be useful and practical. We wrote to Prof. H. L. Bolley of the North Dakota Experiment Station about this. Prof. Bolley probably knows more about it than any other man in the country, and his reply, which follows, does not give much encouragement for the scheme:

"I can very definitely say to you that it is entirely too expensive a process. I have for a number of years been using formaldehyde as a disinfectant, and have been using it consistently and persistently year after year on the same soil for the purpose of finding out if it is possible by any sort of disinfecting means to control the organisms which destroy the roots of flax, potatoes and wheat, particularly flax and wheat. On a piece of wheat-sick soil and a piece of flax-sick soil I have used as high as 40 pounds of formaldehyde per year during the last 10 years, applying at the same time nine barrels of water, to have the soil thoroughly touched with the formaldehyde. This is a very strong strength, and as you will see, the cost would be entirely beyond that which any farmer could make use of. It does not control or prevent the development of the disease known as flax wilt. The crop will make a good growth on such land for a period of five or six weeks, but then immediately the fungus spreads from the deeper lying regions and occupies the land. This is also true of wheat."

HOUSEHOLD CONVENIENCES AT THE STATE FAIR.

WHILE many farmers were studying exhibits of harvesters, riding plows, milking machinery and tractors, the housewives were investigating equipment which will eliminate the word drudgery from the farm woman's every-day task. "Mamma, it is so easy, I can do it myself," was the remark of a little girl as she operated a dishwasher by a to-and-fro movement of a handle. Three dishwashing machines were exhibited, and the machines shown were adapted to hand and electrical power. One dealer declared the gasoline engine could be attached to his machine. The dishwasher with hand power equipped is priced between $20 and $25. The machine is simple in construction and operation. A wire basket holds the plates and cups, and the silverware is stood in a smaller wire basket in the center. Water is dashed through the dishes by a fan-shaped device, after which it may be removed from an opening in the bottom of the washer. Rinsing water may then be dashed in the machine, and the dishes may be removed to the cupboard or allowed to dry. More efficient and lower-priced power washing machines were exhibited than at any previous fair. At least two machines with power equipment, moveable and reversible power wringer, and long stand carrying two galvanized tubs were shown for $35. Several other machines for power were shown at lower and higher prices. The self-heating flat-iron, inexpensive, and costing but $3.50 or $4, heated by gasoline, will relieve the farmer's wife of many hard days of slavery to a red-hot stove in a stuffy kitchen. The little iron is heated with gasoline, is generated similar to the gasoline stove, is safe, and a penny or two will go a long way in doing the ironing.

Lighting and heat have been matters which have interested farmers. Accidents which have formerly occurred when these devices were in earlier stages of development, occasioned the disfavor in which the acetylene plant has been held. These plants were exhibited at the State Fair, and although not absolutely fool-proof, when a plant is established outside the building they are considered unquestionably safe. The old wood stove, the soft coal heater and even the hard coal burner are giving way to the hot-air furnace, the steam and hot-water heat, and these require little more expense in maintenance than does the hard coal burner. They do away with the dread of early rising on cold Winter mornings, have the house warm, the temperature even, and are more healthful than the old methods of heating the home.

The kitchen cabinet is an efficiency system applied to the home. The popular cabinet exhibited at the fair was made of steel, enameled perfectly white, and with compartments so arranged that the housewife could perform the larger part of her duties without leaving the cabinet, and could also be seated while engaged in her work. This cabinet does away with the trip to the pantry, another to the cupboard, another to the flour sack, and another to the spice boxes. Flour, spices, utensils, knives and groceries are all within reach, and for $25 or $30 the housewife can cut in two much of the labor required in preparing the meal.

Running water piped from the spring may be very handy in the house, yet but few people are blessed with the convenience. However, for from $60 to several hundred dollars a hand or power outfit may be installed. The small gasoline engine will operate the pressure tank, water can be forced to any part of the house, and even the barn may be supplied from the same tank. One farmer's wife who had water convenience in the form of a cistern in voicing her appreciation of such equipment declared that she knew nothing of convenience in water supply until the pressure tank was installed on the farm. Their installation, she declared, cost in the vicinity of $200, water was piped to the barn, to the bathroom, and to the kitchen, the farmer doing his own plumbing, the power was supplied by a small horse-power engine, and the satisfaction and convenience in having the equipment had paid for itself in a year, and five times its cost would not remove it from the home.

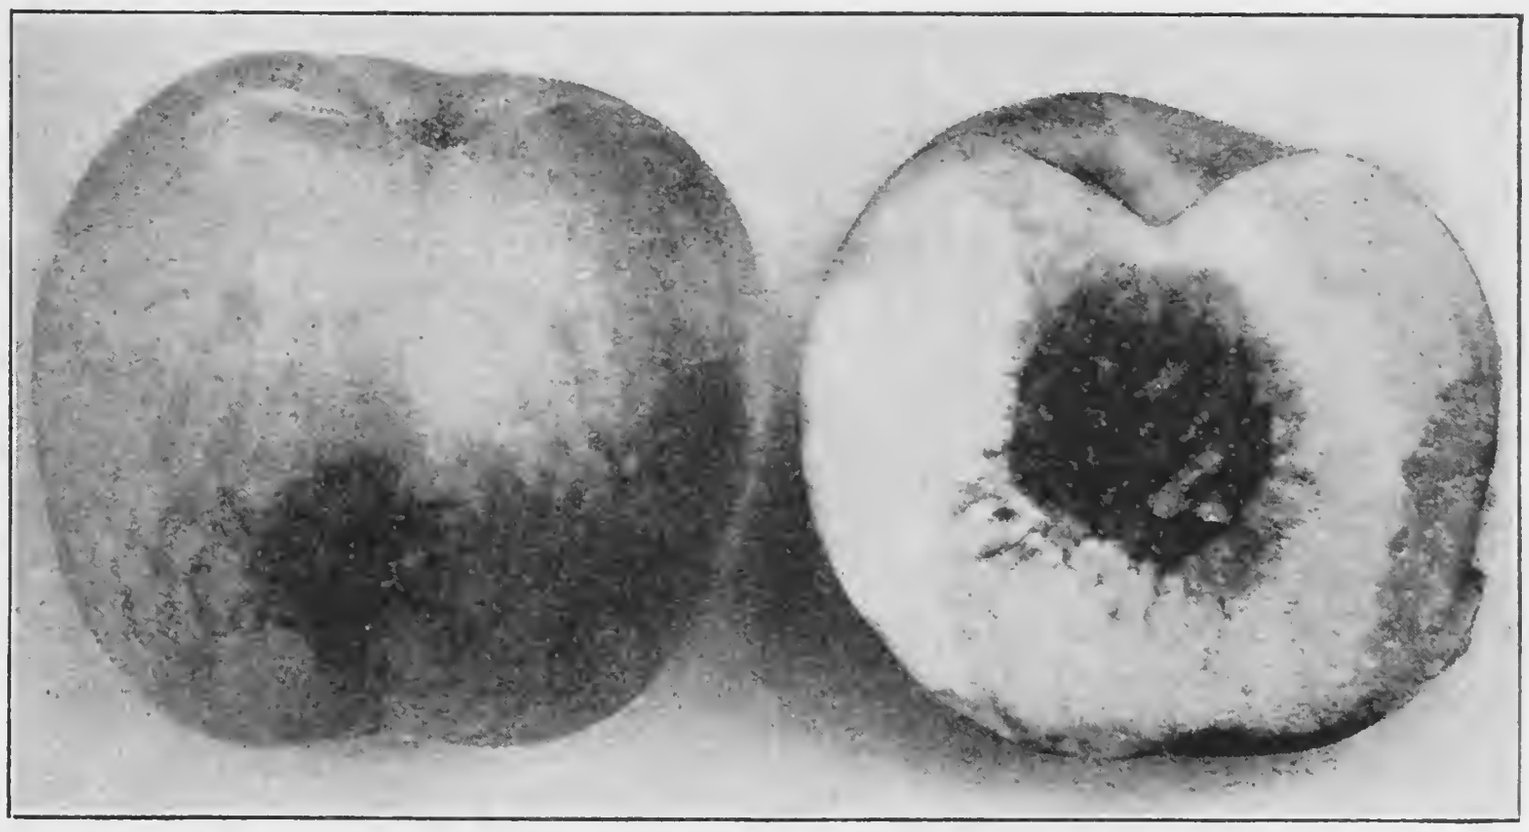
The small horse-power gasoline engine was shown at the fair. Many farm women are afraid of the engine. The little gasoline engine is absolutely safe, far more safe than the gasoline stove; it is quite easily started. One woman upwards of 60 years of age starts and stops a 1½ horse-power engine, and experiences no difficulty. The adjustments are simple and the husband or the hired man can keep the machine in proper running order. Stopping the engine is as easy a matter as turning the dampers on the kitchen stove. Some of the engines are mounted on small trucks and can be hauled about. These engines, however, can be established in the cellar or some convenient place. The odor is not displeasing after one has become familiar with one, and the exhaust may be piped outside the building. The little engines are muffled, but the noise is but partly subdued, yet when they are doing the duty of a hired woman or man about the farm at comparatively no cost, the noise is forgotten. These engines cost from $30 to $50, and may be purchased for even less than $30. W. J.

R. N.-Y.—This brings to mind the combination of water system and lighting we referred to last year, where a gasoline engine operated a compressed air system that forced fresh well water over the house, at the same time storing electricity for lighting.

BUSY DAYS AT GRAPE PICKING. FIG. 494.

GRAPE PICKING IN WESTERN NEW YORK.

THE picture at Fig. 494 is taken from a commercial vineyard in Western New York at the time of picking. When the grapes are ripe there is nothing to do but get them off, and all through the vineyard sections there is a great demand for help. Women and girls are especially useful at work of this kind. They are naturally neat and clean, and show good judgment in the selection of clusters. As a result they are much esteemed as pickers, and find ready employment in the vineyards. Some of them are very expert, and can make excellent wages at picking. At any event it is a clean and healthy occupation, and in the grape regions, at least, one that commands respect.



EXACT SIZE OF CARMAN PEACH GROWN AT HOPE FARM. FIG. 495.

THE GOOD OLD CARMAN PEACH.

THE picture at Fig. 495 shows a fair sample of the Carman peach grown this year at Hope Farm. This peach is familiar enough to most fruit growers, yet every year we have many calls for a description of it. As is well known, the Carman ranks as a white peach, with a very high-colored, brick red cheek when ripe and properly grown. The majority of people seem to regard it as a "cling." When perfectly ripe with us, it breaks quite freely from the pit, although when green it is hard to separate. Its reputation as a "cling" may have come from the fact that many Carmans grown in the South are picked when quite green, and left to ripen as best they can during the shipment. In our own case the Carmans are sold to a nearby trade, so that they may be picked when fully ripe and ready for eating. It therefore ranks with us as a "freestone." We began picking the peach in Northern New Jersey this year the first week in August. On the 15th of September we found a few Carman peaches in a shady place just ready to pick. It would not be safe to say, however, that this long-continued season is characteristic of the variety, as only a few specimens will ever be found after two or three weeks from the beginning of picking. We

(*Continued on next page.*)

regard Carman as one of the finest of eating peaches. It is delicate and high-flavored, and greatly admired by those who know its real value. Most people, however, greatly prefer a yellow peach, and Carman does not sell to advantage with popular trade after Elberta and similar peaches begin to come upon the market. Most housewives unite in demanding a yellow peach for canning. A few of our own customers have tried Carman for this purpose, and prefer it to others. Unless the peach is rather green when put into the can, it does not hold its shape well in canning; but for delicate flavor and general satisfaction, except to those who eat yellow with their eyes, Carman is a magnificent preserving peach. We find it one of our most profitable varieties, although we would not advise too heavy a planting for any shipment in a locality where the yellow peaches are greatly preferred.

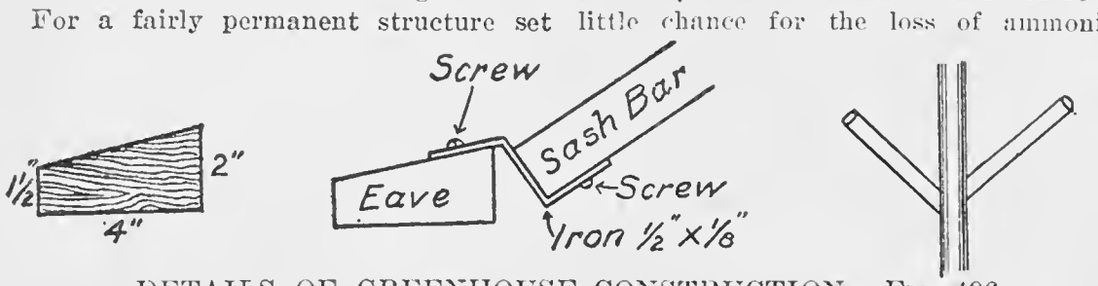
Specifications for Small Greenhouse.

WILL you give me the best proportions and plans for a hothouse containing about 700 square feet, also plans for hot water system with estimated cost? House to be used for raising plants.

Blooming Grove, N. Y. J. S. D.

A house containing 700 square feet could be most economically built to contain one bed in center about 5½ feet wide and side beds three feet wide each side, with two walks about 18 inches wide, or 20 would give more space and convenience for handling plants. This would approximate 15 feet inside and would require sash bars about 9½ to 10 feet long on each side of ridge, according to pitch desired. The house could be 48 feet long, using three 16-foot lengths of cypress about 1¾x5¾ inch for ridge and three lengths in each side for eaves about 2x4-inches on inside of house, and 1½x4 inches outside, as shown in Fig. 496.

For a fairly permanent structure set



DETAILS OF GREENHOUSE CONSTRUCTION. FIG. 496.

1½ inch wrought iron pipe in concrete at intervals of eight feet for posts. On top of each post screw a floor plate and screw the four-inch eave plate on top. The walls can be made of concrete four inches to five inches thick, using bituminous coal ashes nine parts to one Portland cement. Allow about two feet of glass in each side wall under eaves. Have a blacksmith bend a small piece of iron for lower end of each sash bar, ½x⅛-inch being right, as shown in sketch, at center, to fasten bar to eaves. This method of fastening gives longer life to bar and eaves than nailing together would do. Space one-inch pipe at intervals of eight feet under ridge for supports, and about 3½ feet from ridge on each side place a one-inch purlin, fastening each sash bar to same with a pipe strap and running a pipe to each center post, making a double support. Fasten the one-inch pipe to upright posts with an axle clip and flat piece of iron bent so each brace pipe will slip over end. A row of either continuous or intermittent ventilator sash must be placed on one side of ridge about 24 inches wide up and down roof. These sashes can be six or eight feet long if desired, though a sash containing three lights of 16x24-inch glass could be more easily lifted with a rod placed in center than one of greater dimensions. Glass should be 16x24 inch double strength B; this is an excellent size to use. Place the back of each light, or convex side up, and lay the glass in putty, lapping each light over the lower one about 3-16 inch and using a zinc nail or brass point listed by most seedsmen.

The cost of such a house would be very near $200 without heating system. The most economical heating system would be two good-sized stoves placed one near each end, encircled with a sheet-iron shield about a foot from stove extending to within six or eight inches of ground at base and several feet above stove at top. A hot-water system would be expensive to install on account of the many fittings and cuts required on the job, which would exactly equal the same work on a house 150 feet long. Nor would you find a small hot-water boiler that would be as economical in use of fuel as the stove would be, though the hot-water plant would possibly run a little longer without attention. ELMER J. WEAVER.

Foolish Talk About Hen Manure.

I ENCLOSE copy of portion of article published in *The Fruit Belt* for January 1914, and as the fertilizing value of poultry manure seems very high according to this article please advise as to the correctness of the figures given. On a 1,000-hen plant about how many tons of poultry manure would be available for fertilizer each year? S. C.

Bay City, Mich.

The article follows:

Prof. Clairborne says, "Poultry manure is equal as a fertilizer to the best article of Peruvian guano, and if properly cared for under cover, is worth as much as Pacific guano, which is usually worth from $40 to $50 per ton." Prof. Norton says that "300 pounds of well-kept hen manure are equal in value to 14 to 18 two-horse-loads of stable manure." Science in Farming says, "100 pounds of fresh hen manure contains 32.8 pounds of nitrogen, 30.8 pounds of phosphoric acid, and 17 pounds of potash."

With all due respect for Prof. Clairborne and Prof. Norton, this is as rank nonsense as has yet been printed about manures or fertilizers. The New Jersey Experiment Station has printed the figures showing average dry hen manure. Here is a comparison with guano.

	Pounds In One Ton		
	Nitrogen	Phos. Acid	Potash
Hen Manure.....	25	16	8
Peruvian Guano...	110	300	55

The hen manure will vary more or less according to the food, the amount of litter and the way it has been handled, but it is utter nonsense to say it is equal to guano. How can it be when we consider what guano is, the dried manure of sea fowl which feed almost entirely upon fish. The dead bodies of the birds are mixed with the manure, and all are deposited in a dry rainless climate where there is little chance for the loss of ammonia. This dry material is crushed or ground fine. Of course this is superior to coarse hen manure obtained from poultry fed mostly on grain and usually kept under conditions which mean a loss of ammonia. The statement that 300 pounds of hen manure equal 16 to 18 loads of stable manure is too ridiculous to notice. To show the wretched folly of the last statement just remember that nitrate of soda contains only 16 pounds of nitrogen in 100, while these figures make hen manure carry twice as much. Including litter and material used as absorbents 1,000 hens should give above 15 tons of manure in a year—each ton worth from two to three times as much as stable manure!

Lutton's Miniature Glass Gardens

Ordered today will reach you in time to prepare a garden that will supply your table with delicious vegetables and beautiful flowers throughout the long winter months. Frames shipped complete, ready to put together. Quickly assembled, easily ventilated. Built of the same materials as the large ranges of glass which we erect in all parts of the country. Make winter gardening a continual source of pleasure and profit. We manufacture 2, 3 and 4 sash frames, single and double glazed, besides the specials listed below. Complete planting instructions with each frame. Prompt shipment and satisfaction guaranteed. Send your order today.

Special No. 3 Diminutive Greenhouse

Covers 40 sq. ft. of garden space. Probably high enough to receive some of your tallest pet plants. Six large lights of extra heavy glass to each sash. Hinged at top. Easily ventilated, strongly made. Nicely finished, quickly put together. Portable. Carefully packed. Price complete. Freight prepaid anywhere in U. S., $21.00. For double glazing, $1.50 extra.

PRICE DELIVERED **$21.00**

Special No. 2 Beginner's Garden

To meet popular demand, we manufacture this special sash and frame. It's 8 ft. 4 in. long and just wide enough to put in a 3 ft. space. Sash has six large lights of extra heavy glass so that plants receive the maximum of life-giving sunlight. Carefully packed, easily set up. Price complete, freight paid anywhere in U. S., $10.50. For double glazing, $1.00 extra.

PRICE DELIVERED **$10.50**

Our free catalog sent immediately for the asking. Write for it today.

29 YEARS 350 ACRES

There is a "Big Shout" for Apples and Pears

You can sell these fruits for good prices; there is a demand for all that you can raise. I KNOW, for I grow fruit as well as trees.
This year I have the finest lot of Apple and Pear trees you ever saw. They are clean, healthy trees, big trunks, lots of roots.
Write me how many trees you expect to plant this fall or in the spring; I will tell you what sorts are profitable for your section. Ask for my Tree Book, which will help you in planning your new orchard or caring for the old one.
SAMUEL FRASER, Nurseryman, 123 Main Street, Geneseo, N. Y.

Evergreen Trees and Shrubs

i. e., Spruce, Pine, Hemlock, Juniper, etc., transplant well during August, September and October. If interested in any planting problem, write us. We carry in stock the largest collection of Evergreen or Deciduous Trees, plants or shrubs, and can supply in quantity anything required for Forestry, Landscape and Garden planting.

The New England Nurseries Co.
Dept. F. 2. Bedford, Mass.

A Weed Cover Crop.

I PLANTED a small orchard of about 3½ acres in apples and peaches last Spring in the triangular style, apples 40 feet apart and peaches in between, leaving a distance of 20 feet between trees. This ground I have permitted to grow up in weeds, according to an article I read in one of your issues, as being a method employed by a southern grower. Should I plow the weeds under, or cut off the tops and plow the roots and stubble? As I purpose to plant potatoes between the rows next year, what cover crop do you advise? How would you plow? Should I go either east to west, or north to south? To take up the space between the other trees I would have to cross-plow, and that would not be advisable, as I would uncover part of the other furrows. K.

Bound Brook, N. J.

You probably refer to the account we have given of the famous Repp orchard at Glassboro, N. J. This orchard is on light, quick land. It is plowed early and given very thorough culture up to the middle of July. By this time the trees have made enough wood growth, and have started fruit to good size. Experience has shown that if culture were kept up longer there would be more wood growth, with great danger from blight or other disease, and that the fruit would not ripen properly. So the Repp plan is to stop cultivating and let the weeds grow at will and they *do* grow in many cases up above the lower branches of the trees. The usual advice is to seed a cover crop when cultivation stops. We prefer to do this but Mr. Repp lets the weeds grow—and he is a successful fruit grower. This plan is not adapted to all conditions. We do not know the kind of soil you have or how much growth the trees have made. It is a sure thing that he who lets weeds go to seed the year before he grows potatoes is making great trouble for himself. We should plow or disk these weeds under and sow rye. Plow this rye under in the Spring and plant the potatoes in deep furrows—down into the rye. Our plan in such cases is to plow east and west one year and north and south the next. By working across the furrows with a disk harrow you can chop up the strips on the tree rows enough to plant on them. Unless you mark both ways we would not plant on these strips.

Crab Grass in Lawn.

LAST Spring I sowed a lawn, first digging some manure into the land. The grass came up well, but during the Summer, crab grass showed itself very thickly throughout the complete area, and kept coming so rapidly that it was impossible for us to keep ahead of it, and now if we weeded it out, very little lawn would remain. I had decided to dig it over this Fall, but upon reconsideration though perhaps that might only make matters worse, as the manure which was dug under in the Spring, would then be brought to the top; and if I am right in thinking that the crab grass seeds in this manure caused all our trouble, they would (as I believe they live over the season) only be brought to the surface more thickly than ever, and give us a second failure next year. Do you know how long these crab grass seeds remain viable underground? Would it be safe to dig and reseed the lawn a year from now, or must we wait longer? B. R.

Oradell, N. J.

You see from the recent article on crab grass that the seeds are not to be feared as much as the underground stems or buds. The grass spreads underground, and the way to get rid of it is to rip out these roots and destroy them. Thus, if the lawn is not too large, it may be spaded or plowed now. Then follow, on a small scale, the operations described in the recent article on grass seeding. The plan is to stir and dig up the soil constantly so as to rip out the crab grass roots, rake them up and burn them. With a thorough job this Fall the crab grass can be taken out. Then a heavy seeding to lawn grass this Fall will start a thick mat which will cover the ground.

Small Plot Fertilizer Experiment.

TO determine the question of how far I could go at a profit with commercial fertilizer in raising potatoes, I tried an experiment this season. I planted 10 rows across my garden, each row being 1-109th part of an acre. The fertilizer was a standard potato fertilizer with 11 per cent. potash, price $40 per ton. The rows were 32 inches apart and the potatoes planted nine inches apart in the rows. I have reduced all the figures to the acre basis in the attached schedule, and was somewhat surprised at the final results. For all expenses per acre, except fertilizer, I allowed $45 per acre, and charged the fertilizer and land plaster at actual cost. The variety planted was the Cobbler and the blight killed the vines before the tubers had fully grown. We sprayed several times, but got busy with other work that seemed more important, but I doubt if it was. You will note that the addition of 3,000 pounds of land plaster to the acre in the fifth row at an expense of $10 per acre added nothing to the yield, the sixth row, with the same amount of fertilizer per acre, giving a better yield. The seventh row happened to come on the same spot where last year I plowed out a double furrow and filled in with well-rotted manure for squash, and I suspect that the increased yield in this row is thus explained.

Rows	Amount and cost of fertilizer per acre	Marketable Potatoes per acre	No. 2 Potatoes per acre	Total bushels per acre	Tot'l value per acre: No. 1 @ 75c. bu. No. 2 @ 25c. bu.	All other cost per acre	Total cost per acre	Net profit per acre
		BU.	BU.	BU.	$	$	$	$
1	1000 lbs. fr. Cost $20	133	80	213	120	45	65	55
2	1500 lbs. fr. Cost $30	151	80	231	133	45	75	58
3	2000 lbs. fr. Cost $40	158	66	224	135	45	85	50
4	2500 lbs. fr. Cost $50	169	63½	232	143	45	95	48
5	3000 lbs. fr. 3000 l. plas. Cost $70	167	69	236	142	45	115	27
6	3000 lbs. fr. Cost $60	172	68	240	146	45	105	41
7	3500 lbs. fr. Cost $70	217	60	277	178	45	115	63
8	4000 lbs. fr. Cost $80	196	43	239	158	45	125	33
9	4500 lbs. fr. Cost $90	208	50	258	168	45	135	33
10	5000 lbs. fr. Cost $100	229	47	276	184	45	145	39

I am now sorry I did not leave one row unfertilized for a check. With my land and this kind of a season, this experiment seems to show that 1,500 pounds to the acre is the most profitable amount to use. I shall now disk this land and sow it to buckwheat with plenty of hen manure and October 1 turn it under and sow to rye, to plow under in the Spring for another try at potatoes. I hope to get a better acre yield on my next experiment. FREDK. M. PEASLEY.

Connecticut.

R. N.-Y.—There should have been several rows with no fertilizer at all in order to test the true capacity of the soil. Small plot tests of this sort are not entirely safe for large figuring, but they give something of an idea of possible profit, and in this case the lesson seems quite clear that 1,500 pounds of chemicals per acre is about the limit. We are surprised that the plaster did not give better results. With the buckwheat and rye plowed under next year we feel sure this soil will give better results with 1,500 pounds of fertilizer, and the best spots will be where the plaster and the heavier dressings of fertilizer were used this year!

WANT TO KNOW.

I WOULD like to have information, actual experience, regarding putting shredded corn stored in silo direct from corn husked by adding water.

Furniss, Pa. W. F. M.

R. N.-Y.—Let us have experience. In former discussions it seemed to be concluded that shredded fodder in the silo did not pay.

PURIFYING A WELL.—If your M. R. D. will pump air into his well with a bicycle pump and a rubber tube, dropped to the bottom, he can purify the water in 15 minutes, but if the smell returns, after a few days, he would better fill up that well. Any well or cistern can be purified in short order, in this simple way, and yet how few people seem to know it? A. C. W.

WELL GOES DRY.—Have any of your readers ever had the following experience? I have a well 25 feet in depth that always furnished plenty of water, never got very low even during a drought. For the last 15 years we have had no use for it, and it has been covered up. Upon opening it recently we found it to be entirely dry, although we have had rains nearly every day for the last three weeks. Could anyone tell me the cause of all this? J. I. C.

Farmers Using Autocars Save Freight on Produce

R. J. Sutton, a Burlington, N. J., User Tells How He Saves Money

FARMERS who use the *Autocar Delivery Vehicle* have discovered several things. First, that it gets them new markets for their produce which they could not reach with horses. Second, that it gets them better prices because they can deliver the goods where the highest prices prevail. R. J. Sutton, a large produce farmer of Burlington, N. J., tells an interesting story of another feature of *Autocar* saving. He says:

"My place is three miles above Burlington. I raise all kinds of produce. Before I bought my *Autocar Delivery Vehicle* last June, I used to haul my produce to Burlington, where it was shipped by steamer to the market at Philadelphia. The freight was 6 cents a basket and I had frequent losses from rough handling, loss by theft and delay in getting my produce to market.

"Since getting my *Autocar*, I make the round trip to Philadelphia—a distance of 60 odd miles—in 5 hours and make the run every day or night I have produce to ship. I usually load from 120 to 125 baskets and on the freight alone I make a good saving this way because on such a load my freight bill would be $7.50 while the cost of my gasoline and oil for 60 miles is only about $1.21.

"Not only that, but by delivering myself, I can often get better prices and can see that my load gets there in good condition and on time.

"You can see that during the year this cuts down my costs of delivery a good deal and I can get better service beside. I am very much satisfied with the work my *Autocar* is doing."

The Autocar

"Used in Every Line of Business"

What the *Autocar* has done for R. J. Sutton, it is doing for many other farmers. Be sure and get our new book on motor delivery—of value to every farmer. Write to Dept. R.

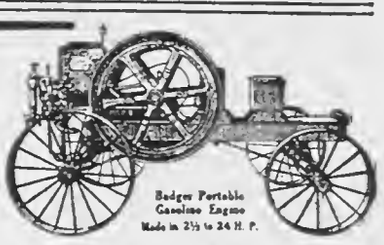
For Threshing and Ensilage Cutting



The "Badger" gasoline engine is the best power plant for the big jobs, like threshing and ensilage cutting. Reliability, plenty of power, steadiness and readiness, required for these big jobs, typify the "Badger." Made of the best materials; speed and parts made adjustable; the engine develops more speed than rated at less cost of fuel. Runs by gas, gasoline or kerosene. Consumes no fuel which is not turned into power.

Badger GASOLINE ENGINES

The "Badger" is always ready to run—Winter or Summer—at an instant's notice. **Every part guaranteed for five years unconditionally.**

Send for Catalog. Free Engineering lessons sent on receipt of dealer's name. Address. **The Christensen Engineering Co., Milwaukee, Wis**

Ground Limestone 50c Per Ton

The day of cheaper lime is here. No need to let your soil stay sick and sour because of the lack of lime if you have lime rock available. No need to let acid land keep you from growing clover or alfalfa. With a Jeffrey Lime Pulver you can grind lime-rock right on your farm at a cost of 50c per ton! This does not include quarrying cost, which varies, but in some sections is almost nothing. Ground limestone is better than burnt lime. It doesn't burn up the humus or waste the Nitrogen in the soil.

Dig out those time rocks that prevent your cultivating your fields. Feed the rocks to the Lime-Pulver, as large as you choose—any size up to 4 inches thick and 11 inches long. The rocks disappear in the hopper. Out of the funnel pours a stream of ground limestone—ground either coarse or fine. It's like turning rocks into dollars—"making bread from stones."

Grinds 2 to 3 Tons Per Hour
Grinds Rock for Road Work Too!

Home Grinding of Limestone PAYS!

A 2 in 1 Crusher and Pulverizer Grinds the Big Rocks—Big Capacity

The Jeffrey Lime-Pulver is the machine that will take the big rocks that come from the quarry and grind them to a powder that will go through the spreader. It is both a crusher and a pulverizer—with twice the capacity of other crushers. Grinds from 2 to 3 tons per hour. Grinds rock for road work and concrete work—grinds corn on the cob, tobacco stems, bone or any similar material—a universal grinder, portable—as easily moved from place to place as a wagon. Built to last a lifetime—with pulverizing hammers of Manganese steel—ball bearing pulverizer. Sold on a guarantee of satisfaction or your money back. Write us today for our free booklet giving price and full information about the Lime-Pulver. Write NOW.

The Jeffrey Lime-Pulver

NEW YORK STATE NEWS.

THE HOP HARVEST.—The hop harvest is practically completed in Schoharie County and the yards are being cleaned up for the Winter. As a whole the crop has been a good one, in some sections better than last year. This is not saying that it has been good everywhere, for black mold and blue mold and lice have absolutely destroyed the crop in some yards. Several fields which ordinarily would have harvested several thousand boxes had to be abandoned as a total loss. On one farm a crop of 3,500 pounds was left on the poles as there were no marketable hops to be found. Quite in contrast with this is the immense crop on the farm of H. V. Pindar of Middleburg, which, according to reports, will yield 120,000 pounds which at the prices now offered, and they may go higher, is worth $60,000. A conservative estimate places the yield of Schoharie yards at 750,000 pounds with a present market value of $375,000.

SEASON FOR WILD FOWL.—The tang of Autumn make the hunter think of his gun and his dog and his game. In relation to the conflict between the State and the Federal laws governing the shooting of wild fowl the State game protector has issued a statement that his protective force has been instructed to enforce the State law and, not being unfriendly to the Federal statute, he also advises that the hunter comply with the Federal law also as the Department of Justice at Washington intends to prosecute all known violations of the Federal law. Under the State law the open season for ducks, geese and brant is from September 16 to January 10, except on Long Island where it begins a month later. Rabbits may be taken from October 1 to January 31, not more than six in one day, and ferrets must not be used. Mink and muskrat, from November 10 to February 10. Skunks same. Squirrels October 10 to November 15, not more than five in one day. Partridges October 10 to November 30.

APPLE CROP STATISTICS.—The State Fruit Growers' Association, collated from 300 replies to a list of questions the facts that the five counties bordering on Lake Ontario produce over half the apples grown in the State. From this section the average was found to be 99.6 per cent. The Hudson River counties produce the next largest quantities, with an average of 70 per cent. for this year. The Baldwin and Ben Davis will go especially heavy.

BIG SHIPMENT OF CATTLE.—The largest shipment of high bred cattle ever sent out of Cortland County went from the Miles J. Peck farm, near Cortland, September 14. It consisted of 75 Holsteins and 26 Guernseys, which made up the first installment, it is said, of 300 cattle. They were shipped by express and were purchased for the Willis Coal and Mining Company of St. Louis, to be placed on a 2,500 acre dairy farm.

NEW BUILDING AT CORNELL.—The two new buildings which will be opened at the State Agricultural College this Fall, are the animal husbandry building and the stock judging building. The institution now has about 20 buildings, the majority of which are completed. The new agronomy building is nearing completion and will be opened about December 1.

CANNING CLUBS.—Cortland County has numerous canning clubs. These have recently federated and Mrs. E. H. Foristall has been chosen the first president. It is looked upon as one of the most important meetings in the interest of home makers that has ever been held in that county. At the recent meeting there were present Mrs. Freeman of Manteno, Ill., who is president of a club of 500 girls. Miss Clara B. Nye, in charge of the canning club work of this State, and Miss Bertha Tittsworth of Cornell university.

COMMISSIONER HUSON ON STATE FAIR.—In a recent newspaper interview Commissioner Huson outlined his views relative to the improvement of the State Fair in some important particulars. He is quoted as saying that the night shows have proven a failure as far as attracting people to the grounds is concerned. He would welcome a return of the carnival parades in Syracuse. The running races failed as a drawing card although liberal purses were offered. In place of the runners he suggests steeple chase attractions and a fox hunt to sandwich the circuit races or supplement them in case the fair is carried over a week. Concerning opening the fair on Labor Day the commissioner is said to favor the plan and to reduce the admission price on that day to 25 cents. He would have a monster Labor Day demonstration on the grounds. The railroad rates are not low enough to warrant the largest attendance of people. Outside a 100-mile radius the rate has been almost prohibitive for the attendance of the farmer and his family.

HEALTH OFFICERS IN SESSION.—There were about 600 health officers of one rank or another at the opening session of the sanitary conference at Saratoga Springs on the 15th. Gov. Glynn addressed the conference and he was followed by Dr. Albert W. Ferris, medical director of the State reservation and Geo. Foster Peabody. An interesting discussion on the vaccination law and the relation of the Department of Education to it, was led by Dr. Thomas E. Finnegan, assistant commissioner of education. Miss Julia C. Lathrop, chief of the Children's Bureau of Washington, spoke on the Physical Examination of School Children.

J. W. D.

CROP NOTES.

OWING to the extreme drought in our county (Mason) it is not in as good condition as in former years, and consequently the dairymen have not been very enthusiastic, and are disposing of their stock to a considerable extent, owing to the scarcity of feed and the high price of food products. Consequently the outlook is not very flattering. J. G.
Ashton, W. Va.

Eggs 25; butter, dairy, 30; potatoes 75; pork, live, nine cents; beef five to six cents; veals 10 cents per pound, live; chickens 13; hay $14 per ton. S. A. W.
Alba, Pa.

Sept. 14. The hustle and bustle of the peach and cantaloupe season has given way to tomatoes, pears and sugar corn. Notwithstanding the fact that the canners contracted for large acreages of tomatoes, owing to a light yield many of them are not running on full time. The contract price for tomatoes was 14 cents per basket while the price to those who did not contract has ranged around 20 cents. Kieffer pears are bringing 20 cents per basket and sugar corn $9 per ton. Hog cholera has made its appearance in some sections and many valuable porkers have been lost by hog raisers. Fodder saving and corn cutting is causing the farmers to hustle. The crop of both corn and fodder is better than for several seasons past. It is estimated that 20,000 baskets of peaches have been taken from the Chandlier orchards near Milton. It was figured out that the price realized was about $1 per basket which will make the total amount reach the $20,000 mark. No other man in lower Delaware is so successful in raising fruit. It is thought his yields are made possible only by the running of smudge fires in the early Spring when there are threatening freezes and heavy frosts. Mr. Chandlier has demonstrated within the past few seasons that the peach industry can be revived in this State and made a paying proposition. Labels on produce shipped this season showing that the fruit or truck has been properly packed and the grower's name has brought much higher prices than the unmarked. The cantaloupe growers in the Williamsville district were the first to take up the idea. C. H.

COMING FARMERS' MEETINGS.

National Apple Day, October 20.

National Dairy Show, Chicago, Ill., October 22-31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein-Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Association, Oct. 27. How To Save Money on Tires

Free to Car Owners for This Coupon
A Firestone Inner Tube Bag and the Firestone Tire Book
Firestone Tire and Rubber Co., Akron, O.
Without obligation on my part please send me free a Firestone Inner Tube Bag and your book, "The Care of Tires." Ask for Book No. 18.
I own a _____
(Name make of car on this line)
I use the following make of tire _____
Name _____
Address _____

THE Firestone experts have answered that question once and for all for every car owner. They have answered it first by building the kind of tires that save most money. And they have answered it also with a valuable book that shows how to save some money, no matter what tires you use.

If you own a car, send the coupon above or write us for this book. If you give us the name of your car and mention what tires you use, we will also send you Free a Firestone Tube Bag. See below.

Firestone
Tires and Tubes

Defeat Them All in Service—Meet the Ordinary in Price

For 15 years—as you may know—Firestone quality has led the world. There has been no break in the matchless record of Firestone Tires in daily service, on all roads, on all kinds of cars. Yet they cost you no more than the average. Firestone builders are tire specialists, with the largest exclusive tire factory in America. You get the benefit of this specialized production and enormous output. Only average price for the tire of extraordinary service. Most Miles per Dollar.

FREE to Car Owners

Tell us the name of your car and the tires you now use, and we will send you Free with our book this popular Firestone Waterproof Tube Bag. Will keep your extra inner tubes fresh, dry and clean, and protect them from injury.

If You Can't Get Firestones Easily We Will Have Them Sent to You

Nearly every dealer sells Firestone Tires, but if your dealer has none, he will get them promptly if you insist. If you are not near a dealer, write us, and we will see that you are supplied from a nearby station.

Cleaning a New England Pasture.

WHAT would you advise in the following matter? I have about 20 acres in pasture, all hill land, soil very good. It has a very rank growth of brush, sprouts from tree stumps and wild berry bushes, etc. What would be the cheapest way to clear this land in order to make it fit to plow? Some people advise sheep, others goats or pigs, blasting powder, hooks to pull out, but as I have never seen land of this kind cleared I am at a loss to know what to choose. I intend to plant 10 acres of the 20 in apple orchard just as soon as I can get the land ready. W. B. R.

Marlboro, Mass.

On general principles goats would probably be the cheapest way, provided one has the goats, but to buy them might be an expensive proposition. In any case these would be slow and probably two or more years lost before the land would be in shape to handle. Pigs with a little help and proper handling would do the job, but would be expensive, as one would either have to keep a lot of pigs to do the job quickly, or keep a few and do a small part at a time, which would mean a long time to wait before really getting down to business. The same arguments would more or less apply to sheep. If W. B. R. has a good or fair team, either horses or oxen, he can get the job done quickest and probably as cheap in the end, counting time, by tackling the job at once or during any spare time he has from now until Spring. However, if obliged to hire a team it will be pretty expensive this way, as a hired team does not always accomplish as much as we think they should. It means hard work, but one has the satisfaction of seeing something gained, and this is a big satisfaction to anyone. Unless the big stumps are thick and of some hard wood like oak, it can be plowed all right with a good strong plow with a good cutter. Birch, alder and such like can be pulled out by a chain or hook if not large; if large can be cut and worked up to pretty close, having an ax or two handy to cut any big roots you cannot break with the plow. Berry bushes can be easily plowed or pulled up if not too thick; if so can be done just the same only requires a harder effort. If one has two teams or a team and an extra horse and man to use him or even a boy, the horse or extra team can be pulling bushes, small trees, or rocks as the case requires, while the first team is plowing.

It will require one or two men with the plow; if one man can handle the team and hold the plow also so much the better, and he can do a better job than having one drive and the other hold the plow, and the second man can use an ax or grub-hoe to good advantage in the meantime, or give any such assistance as may be needed. The man who handles his own team and holds the plow also can stop or start the team just about the second he wishes, while if some one drives for him he has to tell when to do these things and much time is lost. The only time a driver is any use is when one has an uneven team, one always ahead of the other or stopping and starting in the same fashion. With such a team a driver is sometimes useful. Whatever part of the land is plowed this Fall may be used next season to grow a crop, or the trees could be set if owner was in a hurry, but personally I should prefer to work the land a year or two first.

Possibly it could be got in shape this Fall to sow a crop of rye, but if so should be sown by October first, before would be better, so as to handle as early as possible next Spring. This could be cut green or turned under as seemed best to owner. I have a rich neighbor who is doing a lot of this kind of work, only instead of pasture it is mostly young woodland he is reclaiming. He has tried dynamite; this rips out the big stumps all right, but leaves many small roots, and it requires about as much time to clean up after it as to do the job without it, and many of these small roots left, sprout again and cause trouble, while those pulled out by a team do not bother to any extent in this way. If this man's land is not very rocky I should think the plow, etc., would be the cheapest and quickest way, but if very rocky perhaps the slower way with goats, sheep or pigs would be cheaper and better. It is a question the owner must decide himself, as he knows just what time and expense he can put into this better than anyone else. A. E. P.

Potash on Maryland Soils.

WHAT is it that we need, nitrogen, phosphoric acid, or potash, or do we need all? We shall take a field that has been manured and a good sod plowed under, or any other cornfield. We shall put half in field corn and half in sweet corn (pull the ears off sweet corn for market). The part with sweet corn will bring from three to six bushels more wheat to the acre. You can see to the very drill track where the sweet corn was. Of course I want one part of the field as good as the other. Hence what shall I do? A. R. R.

Westminster, Md.

As I understand the question, the field you have in mind for seeding in wheat has been part in sweet corn and part in field corn, the former being cut green and the latter when fully matured. That accounts fully for a difference in the yield of wheat following the two crops in the same field. What you need is more phosphoric acid and potash where you had the field corn. More nitrogen you will not need, if as you say you had a heavily manured sod to start with. The reason is this: It takes much more phosphoric acid and also a certain amount of extra potash to bring a seed crop to maturity. Your sweet corn you harvested green, so that it did not take up the extra amounts of phosphoric acid and potash that the matured field corn used. Both crops on the other hand, used about the same amount of nitrogen, as this element enters largely into the growing of the plant and foliage rather the maturing of the seed.

You can remedy the difference by making more liberal application of an 8-4 or 8-5 acid phosphate and muriate of potash mixture on the part you grew your field corn on. A good mixture would be 1250 pounds of 16% acid phosphate and 200 pounds muriate of potash, which should cost you about $12. This I would apply on the part that had sweet corn at the rate of 250 pounds to the acre and on the part where I had field corn at the rate of 400 pounds. The threatened scarcity of potash may make it unprofitable to buy the muriate for the above mixture, in which case, the next best thing to do would be to make an application of lime at the rate of one ton of burned lime, or two tons of ground limestone, which will help to liberate the soil potash for use as a plant food. As most Maryland lands are well supplied with this soil potash, which lime will free, I would rather depend on liming than on paying a stiff price for any form of commercial potash. R. B.

"I TOLD Uncle Simon that he was getting too old and feeble for business." "Did he take it kindly?" "He threw me out of the office."—Boston Post.

Tire Attacks

Which Goodyears are Best Fitted to Resist

The Fiercest Four

These are the four chief tire troubles:

Rim-Cuts **Loose Treads**
Blow-Outs **Punctures**

Note, for your own sake, how Goodyears meet them in ways exclusive to these tires.

Rim-cuts are impossible in Goodyear No-Rim-Cut tires. We control the way—the only feasible way—to prevent it.

Blow-outs—most of them—occur in weak spots, due to wrinkled fabric. We remove this cause by our "On-Air" cure, which no one else employs.

Loose treads are combated by a patent method, which creates in each tire hundreds of large rubber rivets.

Punctures and skidding are best met by our exclusive All-Weather tread. It is tough and double-thick. The grips are deep, sharp, resistless. Yet the tread—flat and regular—runs as smoothly as plain treads.

No tire ever built offers one of these features save the Goodyear No-Rim-Cut tire.

It's Up to You

These things mean safety, strength, endurance. They mean maximum mileage and minimum trouble.

Getting them depends on you, for any dealer will supply you Goodyear tires. And at less than usual tire prices because of our mammoth output.

Countless men do get them, and tell other men to get them. More men now buy Goodyears than buy any other tire.

Please remember these things when you next buy tires. Don't trust to luck. Don't think that tires are much alike.

The only way to save tire troubles is to buy tires that combat them.

:: Hope Farm ::

"OUR STREET."

MANY of us live in lonely places where there are few neighbors or passers-by. I once lived on a farm off on a side road where only five teams went by in one month. There was no other house in sight. On still mornings in Winter we could see a thin curl of smoke at the end of the valley, and when the leaves were off the trees we could sometimes see a light at night. There were no telephones in those days, and the roads were bad. Those of us who lived in such places were obliged to find society in "the beauties of nature," and I fear they are not fully appreciated until you are shut away from them rather than shut in with them. I was thinking of this the other day as I looked out into West 30th St., from THE R. N.-Y. window.

BLASTING.—It is a scene of destruction just now—rivalling the battlefield of Europe. There must be a drain to take the overflow from the big subway, so they are blasting a big trench 40 feet or more deep, and nearly a mile long through this street. Scrape off a few feet of the upper soil of Manhattan Island and you strike solid rock, and the new ditch must be blasted out foot by foot. The whine and "chug" of the steam drills is constant. Every now and then the workmen will come climbing like ants out of the hole waving red flags to keep the people back. Then there will be an explosion that makes you think the enemy has brought the big siege guns within shot of New York. There is no sign of the effect upon the surface, but the men crawl back into the hole, and great chunks of rock begin to come up. Far down the street stands a steam engine under its little shelter, and steel cables reach away from it like long arms. The big fingers reach down into the hole and bring up great masses of rock or loads of earth and dump them upon waiting wagons.

AN OLD NURSE.—Through the roar and battle of this great project human life flows on in its regular course. Stand on the street corner and look in four directions and you have within the sweep of your eye the homes of 30,000 people—more than are to be found in many entire rural counties. And the human flood which sweeps past you carries all types of humanity—the good, the bad, the weak, the strong, the miserable the contented, the desperate and the hopeful. Here comes our old friend the "nurse," an old man with a white beard who takes care of the family baby. He limps a little as he wheels the little one through the bright sunshine up and down the street. This is his job, and he does it well. Very likely the child's mother is out at work to help support the family, and grandfather, no longer able to do hard work, plays the part of home defender. I have seen old soldiers who, in their young manhood, helped wheel the cannon into line, now serving the home by wheeling the family baby. And the family baby is ever present, for as soon as one climbs out of the carriage to stand on his own legs there is another to be put in. And no child ever had more faithful care than these old veterans give. You should see them on some cool, sunny day when they have wheeled the baby into some bright, protected corner and sit down beside their little charge to rest. They seem to think that if the ending of their own life is not all they hoped for the beginning of the baby shall be right at least.

WORKING DINNERS.—At noon the engine and the steam drills stop for rest, and the workmen get at their dinner. Labor groups itself into classes. The engineers and drillers and higher class workmen are mostly Americans with a good-sized dash of German and Irish blood. There was a time when all such work was done by hand labor—drilling and lifting by brute force of hand and back. Now when steam or electric power does this hard work the men with brains find work directing this mighty power. The crude work is done by newer immigrants—stout fellows just from Italy or Austria. The trap-nest of time will sort them out, and some will be doing the superior work of the future. At dinner time the engineers and head men usually go to some nearby restaurant for food. The laborers curl up at the pleasant side of some building and eat what they have brought from home. Bread is the foundation of their meal. Up to October most of them will have two fried eggs to eat with their bread. When eggs go higher in price it will be cheese or an occasional piece of meat. These men know how to buy the most muscle-making food for a dollar, and they look for it in unexpected places. I often see a big husky man eating bread and onions or a stalk of celery or a tomato, and doing a full job at lifting stones or shoveling dirt. As these men become "Americanized" they will probably come to realize that this is not "a balanced ration."

CHILDREN.—There are troops of them on our street. They come running out of the houses to play upon the sidewalks and pavements. The babies sleep in their carriages out in the air, and the older ones play ball in the street, dodging about among the wagons like little rabbits. They never seem to be hurt. The usual picture of the city child is a thin bloodless little creature starved for fresh air and food. The little ones who play in front of our building are rosy and bright-eyed—full of vitality and mischief. It takes but a short time to get dirty on the pavements, but it must be said that these little scamps are hard-fleshed, sound-limbed and hearty. They rarely see the bare ground or a growing plant, but they are certainly healthy and strong. The city looks after the health of school children—their ears and eyes and teeth and throats are examined and cared for before disease gets too far. So here they are—healthy little animals playing and dancing in the true joy of youth. If country children could have the medical inspection and care which these city youngsters enjoy what a generation of giants would be prepared for us. Down the street comes an old woman on crutches. She has but one foot, but limps about playing the violin at convenient places. It is but poor music, but as she plays the children gather about her and dance. The crutch leading the light, fantastic toe is only one of the curious things in our street.

SELLING FOOD.—A terrible cry comes ringing down the street—rising above the whine of the steam drills and the puff of the engine. *"Ber-r-r-ah-r-r-r!"* But who can put such a sound into letters? There has been nothing more frightful since centuries ago when the Indian tribe which held this part of the island caught some poor fellow from the "enemy" and did their duty as they saw it. Here comes a man with fruit to sell. He has bought a crate of late berries. They were probably sorted over in some dusty corner. Now the boxes are spread out on a board and he goes yelling his cry for customers. "Our Street" does not respond. You cannot break up old friendship with a yell. A wagon soon rattles into the street and our old friend the Italian huckster has come. Here is a man who knows human nature as you know farming and he never harrows it. See him talking with that woman who runs the boarding house? They have got to have their quarrel and argument, but, sooner or later, as sure as fate, she will walk up to the wagon and buy her vegetables for tomorrow. Everything on that wagon has slowly dried for a week or more since it left the vine, and our folks at home would not look at it, but this woman, after much bargaining, buys a cabbage, a few handfuls of stringbeans, a "measure" of potatoes, some suspicious looking peaches. My friend the Italian pockets 75 cents for what you would pick out of the garden and looks around for his next customer. First he twists the tops off two bunches of carrots and feeds them to his faithful friend the horse. Down the street a few doors below the old soldier is sitting on the steps. His folks are good customers, and the Italian goes that way.

WARFARE.—You can see as he sits on the steps to talk that he is discussing the European War. What he really knows about it is probably as far from headquarters as his vegetables are from the vine, but it is a good topic for the old soldier—with friends and comrades gone. There is a little bronze badge at his buttonhole. I do not know how it happened, but as he talked the afternoon sun got at just the right angle to make that little badge gleam like a star. The old man is raising his stick, pointing it out like a sword, and we know without listening that he is fighting his battles over again. It is Gettysburg or Cold Harbor brought down to date in "Our Street." The Italian knows when to stop talking. He knows that attentive listening to these old war stories will sell more goods than any information about Europe that he can give.

PEACE.—There are great contrasts in our street. A few doors below this war-like display lies a dead man waiting for burial. It is only a plain boarding house. The man was only one of the thousands of humble units who go about their work in this great city. Out of the millions here they have perhaps attracted half a dozen friends. They fill no important place in the world's economy. They drop and the machine runs over them. A few friends come to their funeral—out of the boarding house door into our street they carry the coffin much as if it were a trunk that was going upon a journey. The young black-coated minister with the sad, serious face halts on the steps and glances up the street as if he saw something of the awful loneliness in the roar and bustle of our street. There are two women draped in black. Mother, sister, sweetheart, who can tell, and who in our street cares as the carriage turns the corner and is lost in the crowded avenue? The dead man has found peace, but in finding it he has exposed the great difference that lies between our street and the lonely country road. Here the battle of life is so fierce that there is no time even for sympathy when the dead are carried from the ranks. There in the calm country sympathy and neighborly feeling are a part of life, and the dead are not forgotten.

HOPE.—And yet, even as the old soldier discusses his battle and the lonely man is carried to his rest two who carry the great hope of life come walking up our street. The young man, strong and clean-hearted, with a firm place in the world's work, and the young woman, useful, ambitious and fair, are soon to have a home of their own. The old soldier has had his day of glory, the dead man has had his day of toil, but these happy young people are having their day of romance. Who can blame them for not feeling the sorrow or the apprehension as they pass on through the glory which hope and love have painted upon our street? H. W. C.

MRS. HOMESPUN: "What'll we contribute to the minister's donation party?" Farmer Homespun: "Wal, I dunno, Hannah! Taters is 'way up, pork is 'way up, fowl is 'way up—we'll save money by giving him money."—Daily News.

How to Get Lumber at Mill Prices Write to us for prices on lumber delivered to your station. We can furnish you with stock shipped directly from our yellow pine mills and save you a large amount in the cost of your lumber, and supply you with better lumber than sold by a great many retail yards. The capacity of our yellow pine mills is over 75 million feet per annum, and we carry in stock over 25 million feet of dry bright lumber from which to fill orders. If you contemplate building, write us now for information.

Mill Work We can furnish Doors, Window Trim, Moulding, Porch Work, Hardwood, Flooring, also Building Paper, Plaster Board, and Roofing of all kinds.

Home Owners Carpenters Contractors Procure our mill prices before you buy. We will quote wholesale prices on all material delivered to your station. Special bills sawed out. Estimates furnished promptly.

Club Orders We can ship lumber in the same car to two or more parties, whenever requested. You can club with your neighbors and get carload rates making a big saving on small orders.

Send No Money

We ship directly to any responsible party on approval. You can unload and inspect every piece of the shipment before paying us a cent.

Write Today Write to us now for full particulars. We can save you money and furnish you with guaranteed grades of lumber. A postal card from you will bring full information regarding our liberal method of doing business. Write today.

Be Your Own Model

A picture can't tell you whether the fabric is real wool, whether the coat is roomy and comfortable, or whether the clothes will look well on *you*.

Come to the Clothcraft Store and see "4130" Blue Serge Special and other Clothcraft suits and overcoats, for yourself. They're all *guaranteed* pure wool, and it won't take a minute to slip into a coat that's just right for your age, height and chest measure.

Why these particular clothes? Well, because we've looked over everything that sells between ten and twenty-two dollars, and we can't offer you as good value for your money in anything but Clothcraft.

Clothcraft stands for better workmanship, better designing, money saved and put back into fabrics and linings—clothes that will *last* as well as they fit. Come in and see us.

The Clothcraft Store
(in your town)

Write to The Joseph & Feiss Co., 635 St. Clair Ave., Cleveland, Ohio, for their new Style Book, a sample of the all-wool fabric used in Clothcraft "4130" and a personal note of introduction to the Clothcraft Store nearest you.

HANDY BINDER

JUST the thing for preserving files of THE RURAL NEW-YORKER. Durable and cheap. Sent postpaid for 25 cents.

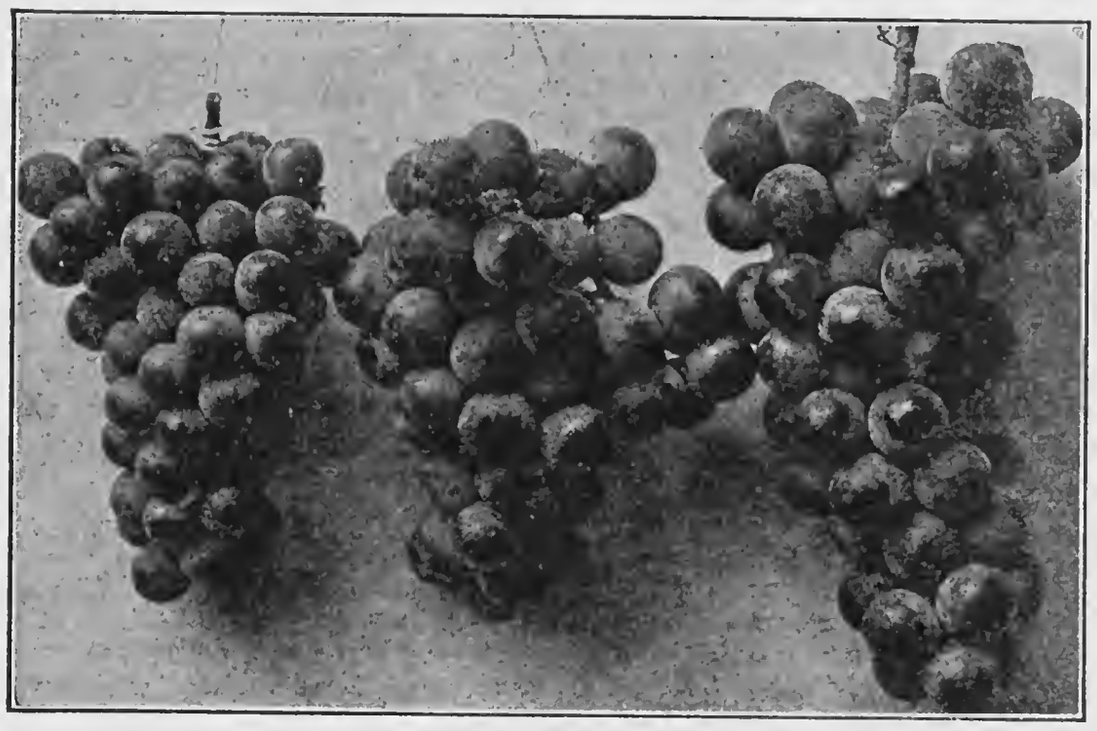
FRUIT NOTES FROM MISSOURI.

WINTER VETCH.—I regret that the Hope Farm man is not able to give a report complimentary to Winter vetch. He attributes his ill-success partly to the substitution of Spring for Winter vetch. I buy seed each year through local or St. Louis houses and have never been deceived in the character of the seed. It seems well proven that in some localities, at least, inoculation is essential for best success but on my soil vetch succeeds without it. Several years ago when in central Michigan I found vetch with rye to be a universal cover crop in the extensive peach orchards where the soil was very sandy. No inoculation was practiced, yet I can well believe that on some soils it might be an essential. I hold vetch of the highest value, filling a gap that no other legume is able to fill here in the central valley where Crimson clover does not succeed. It demands rye as a support and supplements it by storing nitrogen. Nothing equals it in number and size of root tubercles. I have found them half an inch long and a third in thickness. It makes a fine quality of hay as early as May 15 to 20, or as late as June 20, when it is ripening its seed, or provides an enormous mass of organic matter to turn under and feed a corn crop. I tried it this year between rows of grapes and blackberries and with success.



ECLIPSE CAMPBELL MOORE

EARLY GRAPES GROWN IN MISSOURI.

JOE STRAWBERRY.—I note that the Joe strawberry has been put on trial at Hope Farm with the understanding that it requires a thin soil. As an old champion of that berry I enter an energetic protest against such a belief. The Joe belongs to the general class of midseason to late varieties which all require soil of the very highest fertility to mature their heavy yields of large berries. For such kinds anything approaching a thin soil means a crop inferior in size and quality. For 10 years I have grown the Joe alongside all the best-known standards and find it has few equals in producing berries of the largest size combined with beauty and quality. But my experience is that the character of the fruit is in direct ratio with the amount of fertility. I have seen the Joe produce many ounce berries and one that weighed more than two ounces, and it is certainly more prolific and vigorous than the Marshall.

EARLY GRAPES.—A drought since May first has persisted in the South Central States, prevailing through the Ohio Valley and on west to Oklahoma. Just now, this middle of August, we are receiving grateful showers. The fruit crop has been uniformly good. Just as serious damage from drought was imminent, a short rain would providentially fall and carry the plants along for a few more weeks. Never was the advantage of a soil stocked with humus and its surface kept stirred with a fine-toothed cultivator better demonstrated. At present we are in the five or six days before Moore's, thus commanding a high price. This year it was not over two days ahead, and there is little comparison in size of bunch and berry. With Campbell the difference is even more marked. Moore's Early is the standard early grape on the St. Louis market. Its culture is extending as its profits become better known. It has indeed many fine qualities. It is hardy, vigorous in vine and productive and rarely sets fruit in excess of its capacity to ripen perfectly. Its clusters are more compact and larger in berry than the Concord with a heavy bloom combining to make them very showy in the basket. Its chief weakness is a thin skin that will crack in wet weather, and, some might add, a deficiency in productiveness. The last of the trio of early black grapes worthy of mention is Campbell's Early, a variety I have previously proclaimed as the most valuable of all the kinds ever tested here, regardless of season. The present crop again confirms this opinion. It is larger both in bunch and berry than Moore's, better in quality, more productive, never cracks and as a keeper, is unexcelled. It develops just one defect; many imperfect bunches apparently due to lack of pollination, but this is largely offset by size and beauty.

L. R. JOHNSON.

Cape Girardeau Co., Mo.

R. N.-Y.—Regarding the Joe strawberry we have the following letter from the introducers, J. H. Black, Son & Co.:

We were the originators of this variety of strawberries, and had fruited it on every source of conditions of soil. In all localities where it has been grown for years, it has been found that the lighter soil gives a better colored berry, more even in shape and less green tip. It is very susceptible to damp weather conditions when on heavy soil which do not occur of course on light soil. The locality where this variety is grown to greatest perfection is in that section of New Jersey known as the pine land, or along the edge of these pine lands like around Perrineville, Manchester, Lakewood and that section of the country, which as you know is the lightest kind of sandy soil. We have had much larger berries from very very heavy soil, as Mr. Johnson says, but when it comes to fine quality, quantity of berry and beauty of berry there is no place like the sand for this variety, and we think that you will find it so. The greatest crop that we ever saw was on ground where it was so light and so dry that it was too dry for anything in the vegetation line except melons, and this was the greatest and most beautiful crop of berries that we have ever seen of any variety anywhere. In picking them the quarts set so close together that there was not any room between each quart for another one. There were two pickings almost as heavy as this, and three other light pickings, and it is from this very patch that its reputation as a light soil berry first started. To the oldest strawberry growers in this section it was a revelation, and you can hear them talking of it even after nine years have passed by.

JOS. H. BLACK, SON & CO.

Hasn't been under shed for twenty years but this forty year old Studebaker is still working

SOUND, air dried timber, tested iron, exceptionally good workmanship must have been built into a Studebaker Farm Wagon bought by Mr. A. D. Wilson, of Austin, Ind., away back in 1873, for in a letter to Studebaker Mr. Wilson writes:

"I have a Studebaker Farm Wagon purchased in the spring of 1873 from L. E. Carpenter of Seymour, Ind.
"The first 20 years it had fair care taken of it; the remaining time my Studebaker has had rough use. It has stood out of doors in all sorts of weather, and it is a good wagon yet."

FORTY YEARS OF EVIDENCE

—are behind Mr. Wilson's statement. Twenty years of good care and twenty years of neglect failed to impair the usefulness of this Studebaker wagon.

And we have thousands of letters telling about the records of Studebaker Farm Wagons that are just as remarkable as this.

Studebaker Farm Wagons, are just as well built today as they were sixty years ago. Better, in fact, because improved machinery has made better construction possible.

You can't afford to buy any other make of wagon—even at $25 less than a Studebaker.

Studebaker Buggies and Harness are of the same Studebaker quality.

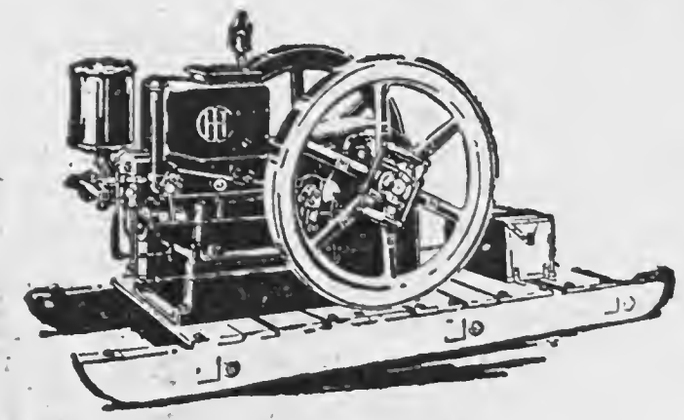
International Harvester Engines
Two Lines—Mogul and Titan



"WHICH engine shall I buy?" If this question troubles you, a little careful observation and investigation will show that the International Harvester engines are the most satisfactory. No doubt is left in your mind when the advantages of features like the following are clear to you: Extra large intake and exhaust valves, proper distribution of weight, cylinder and piston construction, careful workmanship, prompt repair service, etc.

Ask the men who have used I H C engines. That is the best test. They will tell you of the excellence of IHC construction, simplicity, strength and durability.

Study the engines yourself at the nearest dealer's where International Harvester engines are sold. They are made in all styles, and range in all sizes from 1 to 50-H. P. They operate on low and high grade fuels.

Write for our interesting and instructive catalogues, and when we send them we will tell you where the engines may be seen. A postal will do.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

YOUR story in editorial column of August 8 about the macaroni seed reminds me of an incident that occurred here last week. A traveling man, ignorant of farming, has through a mortgage acquired 80 acres near here, and asked me to look it over with him. One field of beans was so weedy that I intimated he would hardly be able to use a bean puller. "Well, that's all right," he rejoined, "don't they pay more for hand-picked beans anyway?" E. H. B.

These back-to-the-landers have their troubles and their illusions, but they are pretty good "sports" and many of them will finally make good. Forced "hand-picking" of weeds to make up for poor horse culture early in the season is a good way to impress the value of improved agriculture upon anyone. The back-to-the-landers will learn in time, or shall we say unlearn?

*

PENNSYLVANIA, like New York, has gone into the real estate business. A list has been made of the abandoned or unoccupied farms in that State. There are only 106 of them, and localities and descriptions are given in a pamphlet just issued by the Agricultural Department at Harrisburg. There has been much talk about the thousands of abandoned farms at the East, but when you actually hunt them up you find a handful of them. Only 106 in the great State of Pennsylvania! There is, however, much cheap land in that State which might well provide homes for good farmers. In fact today Pennsylvania offers very superior advantages of soil, climate and markets to men with reasonable capital who know how to run a farm.

*

MANY complaints come to us from New York State farmers regarding the way road building is carried on. It is claimed that again and again the contractors open long stretches of road, shutting farmers off from the entire distance, and then take their time, and a good deal more, in making the repairs. In many cases it would be just as easy for them to handle this road in short stretches at a time, and thus save the people great inconvenience and trouble. Instead of this they tear up or shut off the entire distance, and often act in a most arbitrary and offensive way in driving people off the highway, and preventing its use for travel. In some parts of the State this has come to be a nuisance, and strong protests have been made to headquarters at Albany. Apparently no notice is taken of such protests, and the contractors seem to be left to do just about as they please in this matter. It is high time whoever is supposed to regulate this matter got busy and stopped this nuisance and outrage upon the public.

*

IN discussing the potash situation as it affects commercial fertilizers, we do not wish to discourage the use of that element or disparage its value. It is one of the three elements of plant food which are absolutely necessary, particularly on our lighter or muck soils and for certain crops, like potatoes or fruit. If it were possible to obtain full supplies of the potash we should advocate the standard mixtures of chemicals which have proved reliable and profitable. The truth is that the European War has shut off the needed potash supplies and in this emergency farmers must do the best they can. That is why we have obtained and printed the best expert advice which this country affords. At this moment we can see little chance for an early ending of the war; nor can we see any American substitute for potash in sight. We advise the use of lime, cover crops and other means we have stated for utilizing the potash now in our soils until peace in Europe makes the potash supplies possible, or some process is discovered for making the American potash available. As soon as we can get potash at a fair price we advise its free use once more.

THIS year, for the first time, we have had a good supply of bees at the farm. We have long desired to test the oft-repeated argument that the bees aid in fertilizing the apple bloom and thus increase the crop. After careful study this year we are convinced that this argument is sound. The bees have, without question, increased our crop and given a larger proportion of strong, well-shaped fruit. With the Baldwin apples in particular this effect is very noticeable. Even if there were no honey crop at all it would pay well to keep the bees. We think also that they help fertilize the currant bloom. All through the Eastern States there is great complaint that the currants begin to form fruit and then shell it off. The trouble is largely due to poor pollenization of the flowers, and we believe that the bees would help as they have certainly helped with our apples.

*

WHO IS THE TRUE TEACHER?

WHAT does it mean to be a good teacher? Very likely most of us in looking back over life can classify the various people who had to do with our education as good, bad, or indifferent teachers. Some of the most highly educated of them would rank in the last class. The best teacher we ever knew was not highly educated in the ordinary sense of the term. One of the leading American scientists, a man whose name is known wherever farmers are interested in improving agriculture, has told us about the best teacher he ever knew. During the Civil War he was a boy attending school in a country district in New England. The teacher was a young woman, new to the district and untried in the school room. No doubt there were people who felt that she was lacking in the education which would fit her to teach properly. During the war political feeling ran high, and the boys and girls of that time were intense partisans. One day, just after the news of a great battle, during the noon hour, the boys saw a speckled hen coming out from behind the fence of the school-yard and walking across the road. They immediately conceived the idea that this was a spy. They chased her and caught her and then decided that there was only one just punishment for a spy. That was hanging, so they secured a rope and without trial or without hearing evidence, prepared to hang that hen. While they were gathered around her preparing for the execution, the teacher appeared. A few inquiries from her brought out the facts about the hanging. Instead of punishing them or taking them into the school room at once, this woman began to ask questions about that hen. Did they know she was a spy? Who could prove that she was there for any illegal purpose? If they were caught in a similar position, what would they think of passing judgment without any chance to be heard or the right to give any evidence? By talking to them in that way this woman changed the entire attitude of those boys in relation to the hen. They saw the point of what she said and the result was a fair trial. The most active of those who had been seeking to hang her tried to prove that she was a spy. The result was that the boys were finally convinced that there was no case against the hen and she was freed after a fair trial! The man who tells this story said that that woman was a great teacher, because she used that simple incident, just at that time, to impress upon the minds of those boys the great Anglo-Saxon principle of a fair trial for all and a respect for civil rights. In the teaching of youth just such things as these are of far greater importance than anything that can ever be learned from the text-book. The ordinary child can be best approached along the line of his understanding. The things which appeal to his childish imagination or reason are the best to take as illustrations for his education. Such training will stick in his mind for life, and the teacher who can do this is the best teacher of all, as those of us who look back and search through life will testify. The year's education for the farm child is now starting. He needs real *teaching* rather than text-book instruction.

*

JERSEY CITY, N. J., is working hard to make public markets succeed. The energetic city government will do all it can to provide a place where farmers may deal direct with consumers. The city people are ready to buy and will come with their money for the goods, but it is a harder problem to induce the farmers to drive in for a retail business. Most of the larger Jersey farmers have become accustomed to doing a wholesale business—driving directly to a commission man and selling a full load. Those who trade in this way are able to give personal attention to collecting and selling. Their wagons and their entire outfits are arranged for this wholesale work. Naturally it will take some time to change properly to retailing. Then there is another consideration. On all the farms within 50 miles of Jersey City hundreds of bushels of farm produce are lost through lack of transportation. Some of it is not first-class, but all would be bought by town consumers if it could be put before them. Horses and men are all busy at harvesting and hauling, and thus this produce is wasted. Now, if some one in Jersey City could organize an auto-truck system to run out among the farms picking up this surplus produce for sale in the public markets, a double purpose would be served. Thousands of tons of produce would be saved from destruction and used for cheap food, and farmers would get into coöperation with the markets as never before. There is a chance to supply the markets and relieve the farmers.

*

NOT much real news gets through from Europe. When 75,000 men can be carried around the North of Europe through Great Britain and across the Channel without the world's knowledge we can realize how little that is worth while leaks out into the newspapers. It does seem to be true, however, that the German harvest is short and that food will soon be scarce. The manufacture of alcoholic drinks is to be reduced and potato flour made in place of alcohol. All sorts of food substitutes will be devised by the painstaking Germans. The necessities of the siege of Paris produced the original oleomargarine. For the past 25 years the chemists have been saying that under the spur of famine, science will find new ways of preparing food—at least substitutes which will sustain human life. The awful waste of the present war will create a demand for the American surplus for years to come, but do not for an instant imagine that any careless or haphazard methods of farming will pay in the future.

*

THE details of the new war taxes are still undecided. It was proposed to tax freight receipts, but President Wilson interfered and advised against it. The argument was that this tax would certainly be shifted entirely upon the buying public, with much more added. The railroads, too, are still crying for higher rates. If the freight tax is abandoned most of the money will probably be raised by increased taxes on liquors. There has been considerable criticism because the tax on whisky was not increased, as with wines and beer. The explanation is that if this were done the immense stores of whiskey now in bonded warehouses would be taken out, and the great sums of money needed to do this would cripple or embarrass the banks! Congress has no longer any great fear or respect for the liquor business. We are told on good authority that a majority of Congressmen favor the submission of an amendment to the constitution prohibiting the liquor traffic. It lacks the necessary two-third vote, but has a majority!

*

I AM sending you under separate cover sample of John Lewis Childs' tree cranberry. If Mr. Childs can eat fruit like that he can do better than we can. The tree looks like a snowball bush and the flowers look like elderberry. MISS C. E. ALLEN.
Ohio.

When it comes to the question of Mr. Childs and eating his own "novelties" we shall have to go back to our favorite old test:

"*He is of age—ask him!*"

We do not care for this "tree cranberry" ourselves. Sour grapes seem to us of better quality. Mr. Childs may enjoy the cranberry sauce which grows on trees for all we know. During the controversy over the old "wonderberry" Mr. Childs stated that he ate the berries freely and seemed to be very fond of them. After eating this wonderberry in pies and sauce and pudding we were forced to conclude, with all due respect for Mr. Childs, that he had a very abnormal taste or else felt much the same affection for his "novelty" that most of us do for our own offspring. Therefore even if Mr. Childs, in reply to Miss Allen's question, says that he will eat tree cranberries with his Thanksgiving turkey we shall still use the berry which grows closer to the ground!

BREVITIES.

THE cur is the curse of sheep raising.

SCRUB bulls are good runners—they run the herd down.

"TABLE scraps" between father and mother make poor feed for the young stock.

THE *dairy* business is surely going to the dogs when the curs drive the cows home.

CANNING fresh meat is becoming a great farm industry—in many cases taking the place of salting and smoking the meat. A supply of this fresh meat is always appreciated. We are told how to do it on page 1161.

WOMAN AND HOME

:: That Pantry of Mandy's ::

Respectfully Dedicated to All the Other Ephraims

THE new house was going to be built in the Spring. For years it had been planned for and dreamed over. Nearly every Winter for the past 10 years, Ephraim had drawn logs to the mill to be worked up into lumber, until now, there were several large piles of it, under the long shed at the south side of the big barn. The lumber was in all shades of seasoning, from the bright yellow of newness to silver gray of age. This Winter the material for framework was fast filling all extra space under the shed. The general plan of the house had been settled long ago. It would be a square two-story affair with a large hall upstairs, extending the whole width of the house, so that the quilting frame could be set up and left until a quilt was done, with no trouble about being in the way. At each corner of the hall a door would open into a bedroom and Mandy had the rolls of rag carpeting all ready for those rooms. Downstairs there was to be a

SHE HAD PAINTED WHAT LITTLE WOODWORK THERE WAS.

parlor and parlor bedroom in the north end; a long narrow dining room and pantry were to fill the center portion, and the kitchen and kitchen bedroom were to be in the south end. Doors were to open on the front porch from the parlor and dining room. The end of the dining room next the pantry was to have cupboard doors opening into both dining room and pantry "like they had up at Silas Endicott's new house."

Mandy had but to close her eyes to see how the whole house would look when done. There was one place, however, that seemed to be always in her thoughts, and that was the pantry. In the old house convenience had been completely disregarded. The pantry was nearly as large as the kitchen, and was situated at the farther side of the sitting room. This had been a sore trial to Mandy ever since she had come as a bride to the little house. In those first years there was too much to be done outside to leave much time for making changes in the house. Once, when Mandy had asked if they couldn't take the tiny box of a kitchen bedroom and turn it into a pantry and tear out the shelves of the much larger room for a bedroom, Ephraim had said:

"Now don't you get in a hurry for changes in the old house, Mandy. Just you hold your horses a while longer and when we build the new house you can have all the pantries you want, and just where you want 'em."

It wouldn't have been nearly so bad, but Ephraim and the boys used the pantry as a storage for all sorts of their things. The top shelves were always filled with tools, bits of board, pieces of wood for ax and hammer handles, oil cans and even parts of their farm tools. Nails, bolts, hooks and staples were everywhere. Back of the door, there hung nearly always an assortment of harness straps and pieces of reins that for some reason or other could not stay at the barn. At any time Mandy was liable to find a hammer or a bottle of horse liniment on one of her lower shelves, where it had been hastily left, for her to put away and produce again at any time of day or night, that it might be wanted.

"Where's the hammer, Mandy?" had long been a familiar demand, and had she not been the peaceable soul she was, there would have been trouble long ago.

That was a busy Spring and Summer for everyone, but by the first of November the new house was practically done. Of course there was the papering and painting to be done, but Mandy would manage to do that somehow before Spring.

Ephraim took no sort of a fancy to stained and varnished woodwork.

"All right for style, mabbe," he said, "but ye can't beat Mandy's paintin' for good hard wear."

For Mandy the Summer had been especially burdensome, and when November came she was tired, as she said, to the very marrow of her bones. Extra help meant extra work for her, and as no one had any time to spend on the garden except to plow it, she had worked early and late, with occasional help from the two boys, when they were not needed by their father. There was but one room really finished to Mandy's satisfaction, and that was her pantry. She had painted what little woodwork there was, a soft yellow. The walls and ceiling she had papered with washable wallpaper of a tile design in green and cream color. The only thing in the little room was an old kitchen table with a white oilcloth cover. It stood at the right of the cupboards, that opened through into the dining room. She had had the carpenter build a lower cupboard under the others for her tins, kettles and such things. But best of all there wasn't a nail or a hook anywhere in sight in the room.

Sometime when Ephraim had purchased the gasoline engine and had put the water into the barn perhaps she would have a sink with the water in the house. She would have it where the old table stood now, and in the dim distance—she hardly dared let herself think of it at all—there would be one of those glorious kitchen cabinets standing in that free space opposite the cupboard. Once, when she and Ephraim had been to town, she had seen one in the window of a furniture store. She had called his attention to it saying that "they must be grand things," but Ephraim had said decidedly:

"They may be all right for style, Mandy, but it strikes me a thing like that would look a lot better in a settin' room than stuck off out of sight in a kitchen."

One day near the middle of November, Mandy received a card from the woman in Constable, who was to weave the new yarn carpet for the parlor, asking her to come, if possible, that week. There was some question about the shading of the wide red stripe that must be settled before she began to weave.

The yarn for that carpet had taken months to prepare and color, and was Mandy's especial pride. She decided to see to it at once and by 10 o'clock the next forenoon, Mandy, driving old Billy, was traveling down the Belmont hills toward Malone with her mind intent on that red stripe.

After she had gone Ephraim thought of a loose plank in Billy's stall, and thinking this would be a good time to mend it, he went to the old house to get his tools. The little house had been left where it stood, a little back and to the right of the new one. In the Spring it would be moved to the barn and the frame used for part of a new cowshed. Ephraim found his hammer, and with some difficulty sorted out some long spikes from an assortment of odds and ends on one of the shelves of the deserted pantry. With both pockets full, he went back to warm up a while before going to the barn.

Standing beside the open oven door he tossed his mittens on the stove shelf to warm and began shifting the spikes so that they would all be in one pocket.

"What in time, did I take so many for," he grumbled, "don't need more'n half as many to fix that stall. Guess I'll lay part of 'em up so 't they won't get lost up 't the barn."

He started for the pantry, pulling them out as he went, but at the door he stopped and stared as if he had seen the room for the first time only. Not a shelf in sight! He went in and opened a cupboard door. The top shelves held the neat stacks of Mandy's best dishes, the lower ones, the everyday dishes, with not a bit of extra space.

He opened the lower cupboard. One shelf, but at one end were the piles of bread and cake tins, and at the other the bluing bottle, a few bars of soap, a box of stove blackening and the cleanser box. Around the sides of the cupboard hung graniteware dishes, and a row of kettles stood on folded papers in the bottom. One other cupboard remained, but here on the lower shelf was the bread jar, the doughnut jar, and the cookie can. On the upper one there were a couple of Mandy's custard pies, a maple-sugar cake and some other eatables. The four small drawers held knives and forks, dish towels and such things.

Ephraim straightened up: "Well, if that wouldn't jest take ye to the fair!" He opened the top cupboard again, carefully deposited the spikes in the top platter of Mandy's best "set," and went back to the oven door to think it over.

"I haven't felt more'n half at home in this new house since 'twas done," he mused, "and I never knew what the trouble was 'til this minute. It's that blamed pantry. Guess I'd better fix it today while she's away an' give her a surprise. Don't see how in time she's got along with it in the shape it's in."

The door opened and the elder boy came in.

"I thought you were going to fix Billy's stall," he said. "I've been waiting for you 'til I got sick of it."

"Billy's stall can wait, Lant," said Ephraim. "I'm going to put the shelves in that pantry today. 'Taint my fault it hasn't been done before, but when I offered to do it, yer ma said 'never mind the shelves' and so I sort of let it hang on."

"But, pa," cried Lant, "she told me she liked it just the way it was and she said we boys have got to——"

"See here," broke in Ephraim, "I saw pantries long before you was born, and I

"SAY, MANDY, JEST GIVE ME THE HAMMER AND A TACK."

know what I'm talking about. That don't look no more like a pantry than I do, an' I'm going to fix it. All you have to do is to step lively and do as yer told. We'll have to work if we get it done before she comes back."

It was nearly four o'clock, and Mandy was nearly home when old Billy, throwing up his head to make his customary dash for home, broke his check rein and went trotting gayly up the driveway with the broken check flying wildly. The pantry was done and they had just finished putting "the things" into it when they saw Mandy drive in.

"There," said Ephraim, "when yer ma once gets the papers on those shelves it will be as slick as a whistle."

Ephraim saw the broken check and hurried out so that he was not there to see the look of utter dismay on Mandy's face when she saw what had been going on. The table had been taken out and placed in the kitchen, and the entire wall space to within two feet of the ceiling and the floor was covered by those detestable shelves. Worst of all, there before her lay the same old collection of tools, nails, bolts and every thing just as it had been before, and left for her to arrange and care for of course. She was just turning away sick to her very soul, when Ephraim came in with a rush.

"Say, Mandy, jest gim me the hammer and a tack and I think I can fix this check rein so's twill be all right." But Mandy turned suddenly into the dining room and went upstairs.

Ephraim stared a minute, and then went to fumble away after the tacks himself.

"Blame the things anyway; he knew he brought them in and put them somewhere. "Queer," he said to himself, "how

(*Concluded on Page* 1163.)

WHEN THEY BUILT THE NEW FARMHOUSE.

Woman and Home

In Prison.

A GOLDEN EAGLE.

I saw him, nobly poised, imprisoned there,
In a poor place, housed in a narrow cage;
That royal spirit, lord of the upper air,
With great wings folded, mute in sullen rage.
And all the luster of the golden noons,
And all the splendor of the scattered stars,
And the fair glory of unclouded moons,
Met in that lightning glance, behind the bars.
Those untamed eyes that answered to the sun,
Now glittering in the dimness, turned on me;
I shall remember till my race is run
The still, proud anguish of that voiceless plea.

THE MONKEYS.

I, who laughed at first at the little solemn sages,
Quaint and smileless creatures, wrinkled as with years,
Felt the sudden weight of the sorrow of the ages—
Saw the weird, small faces through a mist of tears.

A BLACK PANTHER.

In dumb, unwearied protest, to and fro,
He paces, pausing but for food and sleep.
Oh, for a song to voice the hidden woe
Of those wild souls that cannot plead nor weep.

—Marion Couthouy Smith in the Youth's Companion.

*

A Little Parable.

I made the cross myself whose weight
Was later laid on me.
This thought is torture as I toil
Up life's steep Calvary.

To think mine own hands drove the nails!
I sang a merry song,
And chose the heaviest wood I had
To build it firm and strong.

If I had guessed—if I had dreamed
Its weight was meant for me,
I should have made a lighter cross
To bear up Calvary.

—Anne Reeve Aldrich.

*

"It Can't Be Done."

The man who misses all the fun
Is he who says, "It can't be done!"
In solemn pride he stands aloof
And greets each venture with reproof,
Had he the power, he'd efface
The history of the human race;
We'd have no steam nor trolley cars,
No streets lit by electric stars;
No telegraph nor telephone.
We'd linger in the age of stone,
Where when some keen barbaric brain
Of life's conditions dared complain,
And planned a wheel on which to roll
The load his arms could not control,
Sneers rose from all the mighty crew
That ever scoffs at what is new.
The world would sleep if things were run
By men who say, "It can't be done!"

—Washington Star.

Home Economics in New Jersey.

ONE thing you may say for New Jersey—when the State goes out to do a thing it is done solidly and well. In educational matters the State takes high rank—particularly in lines of agricultural education. Not showy but sound is the keynote of development in New Jersey. The N. J. Agricultural College is now to organize a department of home economics with Miss M. A. Hauser at the head. A picture of Miss Hauser is shown on this page. Miss Hauser's previous education, training and experience should insure her success in the work in New Jersey. She attended the York Collegiate Institute of York, Pa., and was later graduated from the Pennsylvania State Normal School at Millersville, Pa. Previous to taking up work in college she taught in the rural schools for three years and for six years in the city of York. Subsequently she entered and graduated from the Pennsylvania State College in the course in home economics. Following her junior year at college, she taught home economies in the Summer teachers' session at the institution and was also engaged in this work during the Summer of 1914.

The home economics extension work in New Jersey has not as yet been thoroughly organized, but Miss Hauser plans to coöperate in canning demonstrations and other phases of her work with the women's clubs and rural organizations of the State, and is endeavoring to outline a definite line of action as the work opens up. Miss Hauser took charge September first.

*

SOME country girls are taking up the plan of spending their vacation in the city instead of going to some "resort." City people go to the country for a rest and change. Why not the reverse of this plan for the country girl? We have reports from several who worked out this plan with satisfaction. Through the Y. W. C. A. or some similar organization they obtained rooms at a fair price, and took their meals where they pleased—living quietly and without fuss in the great city.

*

I SAW an article where some one, L. S., was pestered with bats in the attic. I once lived in a place which was the same, and this is what I did and got rid of them by using twice. I fumigated with sulphur and gave a good cleaning afterward. If the opening is small, make

PROF. M. ANNA HAUSER.

it large enough for them to get out, even if you take out a small window. This is what we did and went outside and the bats were glad to get out; they came out as fast as they could. If they come back give them another dose, this is what we did and were never bothered any more. MRS. J. C.

*

IN both France and Germany and also in Belgium, practically all men capable of carrying arms have joined the army. The work at home, and particularly on the farms, is being done by women who are making most remarkable sacrifices for their country. During our Civil War both in New England and in parts of the South, practically every strong man in entire townships went to the front, while the farming and much of the town business was carried on by women. It has ever been both the penalty and the privilege of woman to endure the hardships of war without glory or proper credit.

*

WE probably all know people who are guided in their daily conduct very largely by their emotions. It may be joy, affection, grief or hate, but in any event the emotions are not guided by reason or experience but simply turned loose. Leaving action to be guided by the emotions is much like giving the reins to a spirited team and letting them take the road as they will. Many of the sad human failures which come to manhood and womanhood unprepared to take any serious part in the work of life are just the result of leaving the emotions unrestrained in training children. Without restraint and self-denial men and women do far more harm through mistaken kindness than through fair severity.

*

THE pupils at a Brooklyn school got out a program to announce their field day events, and hired an agent to obtain local advertising for them. When the program appeared they found the advertisement of a liquor dealer, and a great commotion ensued. Parents, teachers, and all made universal protests against any such advertising in a child's program. This shows the way public sentiment is developing on the liquor questions. Liquor advertising is being steadily driven out of the columns of all reputable newspapers. No worse thing could be done for children than to admit for an instant that the liquor business has any legitimate right in a church or educational program.

*

THE young women students of the Kansas Agricultural College are to have a new course of study this Fall. This is a course in costume designing. The teacher will be Miss Nellie Hunt, who has been trained at a fine art school in New York. The object of this study will be to develop what is called a "spirit of individuality in selecting costumes." At the present time a great majority of young women apparently imitate some one they see on the street, or something they see in a shop window when they select a dress. They would often appear to far better advantage if they could show some originality in the selection of hats or dresses, or general costumes, rather than to follow some ordinary style. We think this is the first attempt to teach such things in an agricultural college. If these young women can be taught something of art and good sense in designing their clothing, it would be a good thing.

*

THIS is the season when our boys and girls leave us for school or college. It makes a large hole in the home when they go, and we all have the feeling that John and Mary can never be quite the same again. It is something of a speculation, too, for this thing we call "education" may turn our children into masterful men and women, or make them the slaves of habit or what is known as "canned thought." After all, it is the way the child has been brought up that counts and the hold the home has upon him, which will steer him right through college. You can hardly expect to begin the college education now. It should have been started at the cradle. We hope you will read and study the article by Dr. E. H. Jenkins which begins in this issue. It is for you as well as for your children.

*

THE Christmas custom of shopping and gift giving is rapidly gaining ground in India. It is not a Christian country, and there is a very small minority of Europeans, yet the Christmas spirit seems to pervade all classes of people. What is known as the "Purdah" system has excluded all high-class Hindoo women from appearing in public. They are not supposed to be viewed by any man except their husbands or their own relatives. This system is now fast breaking down, and such women are visiting the stores either in person or purchasing through their husbands. This Christmas spirit of buying and presenting gifts has its commercial side, for it has greatly increased the demand for a large number of goods. Here is human nature too, for it is the desire to follow the world's prevailing style which has induced these Hindoo women to break out of their "Purdah" system and go shopping.

*

LAST month a New England woman wrote about boarding elderly people or invalids. The plan seemed sensible, and it is probable that there are a number of people who would pay a reasonable sum to be cared for. Something like a dozen letters have already come in regard to this plan. One woman wants to obtain some elderly people to board, who will pay her a lump sum at first. She naively says that she needs this money at once, and expects to get it in this way. Just consider the situation a moment. No one would think of sending their relatives or friends to board unless they were entirely satisfied with the conditions. People who solicit such business must expect to give the best of references, and prove their character and capability. Taking the aged or the sick to board is no holiday programme if you do your full duty to the boarders. Unless you are willing to do that it is far better not to try such work. It will be no sinecure or easy job at best, and the friends of your boarder have the right to make the most careful investigation before they make a bargain.

The other side is to be considered too. We have a case where a lawyer and a minister put their old mother out to board with a farmer making a contract to pay him $2 per week! The woman became nearly helpless and her sons repudiated the contract—leaving the farmer with a loss of nearly $100. Thus there are two sides to such a business—for it is a business and not a philanthropic plan.

*

THERE is one thing quite sure in New York politics. The question of votes for women is to be submitted to the people. All the political parties have declared in favor of such submission. As things are now the men will decide it. Unquestionably the cause has been gaining ground of late, particularly in the cities. Here in New York City it is now a common thing to see crowds of people gathered at street corners listening to talks by women. These meetings appear to grow larger, and the cause is undoubtedly making converts. Women now have the right to vote in Kansas. We wrote a number of our women readers in Kansas asking for a fair statement. The first reply—typical of others—follows:

My acquaintance is not large, but as far as it goes am sorry to say the women are not much interested in voting, regarding it as a joke. However, I think they will now become more and more interested as time passes. As it is, perhaps they are about as fit to vote as their husbands, as the average man knows little and seems to care less what he is voting for. You must remember this is the most unprogressive part of the State, the southeastern mining district.

*

The most encouraging feature of progress in the country today, is the rights of the child. This is the century of the child, and the study of its needs and requirements, so as to safeguard it physically, mentally and morally, has become a science. We are hearing and reading daily of labor and pure food laws, sanitary conditions are demanded where the youth are employed, and all for the betterment of the child in its formative period. It is well for future generations that this is so, for statistics tell us three million children are born every year in the United States, and the trained teachers which are employed annually for the education of the youth exceeds all other professions. Every child is joint heir to all the vast sums of money which is spent, the scientific research constantly going on, the moral safeguarding in city and town which means so much to the youth.

The question in THE R. N.-Y. is, why do employers say: "No children wanted?" We might ask, why should they be wanted? The employee has children of his own to do the little jobs a child can do and as it has been proven many times, two sets of children do not agree very well at all times. The average child is something of an explorer; if not well curbed, he wants to prowl through the barn and test the disposition of the setting hen, and if there is an animal which he is told to leave alone as dangerous, that is the one, like Mother Eve, he wants to get acquainted with, and at a distance to insure his own safety, he likes to prod and throw stones at. Of course cherries, plums and apples are free plunder; they just grow on trees without any labor to anyone, and if there is a reserved garret in the house sacred to relics of by-gone days, why that is just "rubbish" for children to play with and to destroy. That is the dark side of the question, for there are many children who come with the hired man to childless homes and who are well brought up and taught to respect the property of others, and are obedient and industrious, and they are welcomed and thought much of, and grow up to become citizens of the place. The solution of the problem is this: If the home coöperates with the school, church, and the laws, looks as carefully after the company the child keeps, the books they read, sees they are in school every day they are sent, gets in close touch with the growing boy and girl, and spends as much time that way as in feeding and dressing them, they will grow up self-respecting men and women whom the country needs. A. F.

Business

Farm Women As Earners

Beginning a Farm Business.

AFTER my husband died I had visions of a time, perhaps 15 years distant, when my girlie would be ready for high school, our bank account would be gone, and no funds forthcoming with which to pay expenses, unless I could build well for the future. I had formerly been a teacher, but couldn't teach now without leaving my baby. I had no idea of leaving her, and therefore must make a living in my own home. I finally purchased five acres of good level land with a nine-room house, poultry house, etc., and between 50 and 60 bearing apple trees. I knew nothing of the business side of farming so must necessarily go very carefully for I knew I could easily "sink" all I had. It seemed best to devote the first Summer exclusively to studying the business—I won't say learning it, for a lifetime could easily be devoted to that. Practically everything thus far has been experimental, the aim being to get my bearings, as it were, and decide on my work for next year, when my baby will be less trouble and I can get more time to look after details. As she will not be two years old for nearly three months she is pretty small to "farm" with very successfully.

With the object in mind of finding the thing with which I should be most succesful I planted a mixed garden and berry patch, consisting of nearly all common vegetables and berries. I bought less than 500 berry plants, including strawberries, blackberries, red and black raspberries, and gooseberries. I also took care to have as many varieties of each kind as possible for the money invested. My Columbian black raspberries all died, but nearly all the other plants are doing finely, and I expect a fair crop from them next year. Raspberries bring from 15 to 17 cents per quart here, and all berries are usually high all Summer, so we shall put out a good many more next Spring. My immediate profits came as great discoveries are said to do—by accident. I put in two packages of tomato seed with the idea that if I had a money crop that would be the one, but it has been such a poor year for tomatoes that I find myself with a wilderness of vines and worlds of tomatoes, but very few salable ones, though I did sell a few plants, and may sell a few tomatoes later. Peas, however, which were planted in where other seed failed to come, and put out entirely as an afterthought, sold readily for $1.50 per bushel. Right there a valuable lesson was learned. The same time and labor spent on peas instead of tomatoes would bring a hundred times greater profit. Next year there will be about four plantings of peas, about two quarts of seed to each planting, which will give a good succession, and the amount will be about what I can pick and market without help.

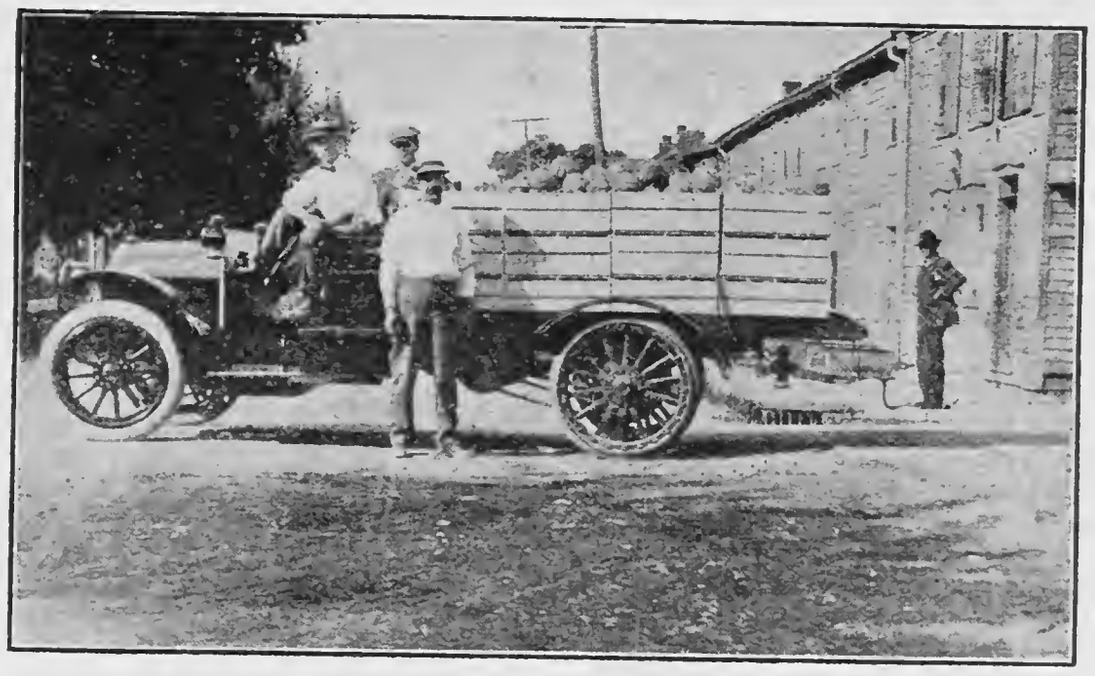
Cucumbers were planted in a waste corner to prevent the weeds from taking possession and these sold for slicers at 20 cents per dozen. I took my baby girl, went to the nearest city and called on a prominent grocer, where I found a ready market for horseradish of which I have plenty. It brings 90 cents per dozen wholesale or 10 cents per bottle retail. After consulting my neighbor, who is a fruit man, I bought 24 new fruit trees—apple, pear, and cherry—direct from a reliable nursery, paying less than $3. Every one grew and is doing nicely. We have more vegetables of all kinds than we shall use, but gardening requires a wheel hoe, and next year one will be added to the equipment of the farm.

Knowing nothing about raising poultry I knew I might easily fail, and the failure *mustn't* be a big one, so I bought 30 day-old chicks and 40 yearling hens. It isn't scientific, I know, to buy old hens, but pullets aren't for sale in Spring or Summer, and would cost $1.50 each if they were, whereas I bought hens at 16 cents per pound, making an average of less than 50 cents each. Even now while they are molting I get a crate of eggs in 11 or 12 days, which bring 28 cents per dozen. From my chicks I raised all but three and have about 18 nice pullets which ought to lay in November, but as a hen has no sense of duty they probably won't. However I have cleared much more on my investment than the bank would have given me, have a comfortable home for myself and my baby ,and have learned lots of things to apply next year. We are four miles from a big Summer resort and 14 miles from a city of 30,000 inhabitants, so our markets are good, but no one could have known less of business than I did. I'm simply feeling my way and learning as I go along.

MRS. E. M. ANDERSON.

A Business in Pickles.

THE Department of Agriculture tells of a woman at Richmond, Virginia, who has made a national reputation putting up and selling pickles. She began in a small way with so fine a product that her goods advertised themselves, and the sales spread all over the country. There is opportunity here for many a farmer's wife and daughter to develop a good business. Many people are exceedingly fond of pickles and sauces, and they will buy them in large quantities where they probably would not purchase the ordinary canned goods. The price of the pickles also is higher than that of canned fruit and vegetables, so that a better price may be charged for them. The farm woman should first practice until she knows how to put up products entirely satisfactory for home use. Having done this, she may look about for her market. A woman who goes into this business must be thoroughly careful, and also be possessed of infinite patience and determination, for it may be a long time before she can hope to establish herself in a permanent business. There is a good opportunity in this, however, for some persistent woman who can make a good product and has the determination to stay by the business until it has been developed. The Department gives some good advice about putting these goods upon the market. The time has come when the farmer's wife can make good use of printers ink and parcel post in developing a business. Such a business would be a benefit to the farm in a number of ways. It will give the farm woman a more independent position, with an income of her own, and what is even better—give her something new to think about. The interest she will take in the development of her business, and the correspondence with distant people, will help her greatly and broaden out her life as well as adding money to her purse.



A BUSINESS AUTO-TRUCK ON A VEGETABLE FARM.

Always Make a Written Contract.

TWO years ago my relative and I decided to go into the poultry business, so we bought the eggs, each paying half. We have built two houses and other things to carry on the business, and in all I have paid for half. In this way I have kept my share of the profits, which I claim as mine, also I claim half the stock. I have done all the chicken work, besides working on the place. I have drawn monthly wages. Now my relative claims that all I am entitled to is my wages. Do I own half the stock and am I entitled to half the profit? I am willing to allow a fair interest on the investment for my share for rent, as he runs the place. If I am right in my claim have I a right to sell half of the stock? There was no written agreement. I never thought that he would not do as we agreed to without having it in writing. He does all the business, handles all the money for the place.

HEN MAN.

R. N.-Y.—Our only reason for airing this sad family trouble is to impress upon our people the need of making a definite written contract whenever they start to do business. Do not trust to verbal agreements or what you think the other party will do. Have it put in writing, using a regular legal form and then you will know just what to expect. In the above mentioned case the relatives ought to get together and divide fairly if they cannot agree. As it is with the misunderstanding a legal battle may be necessary.

What Direct Trade Does.

BEING engaged as a market gardener who sells vegetables, fruit, butter, buttermilk and eggs directly to customers on regular route from a wagon, I give below a memorandum of a load marketed on my one-horse wagon on July 10, this year:

28	heads cabbage at 5c	$1.40
34	cucumbers (slicers) at 5c	1.70
23	bunches onions at 5c	1.15
16	bunches beets at 5c	.80
13	bunches radishes at 5c	.65
15	quarts beans at 10c	1.50
10	quarts peas at 10c	1.00
18	pounds tomatoes at 10c	1.80
15	pounds lettuce at 5c	.75
3	bushels apples at 30c per peck.	3.60
18	pounds butter at 30c	5.40
30	quarts buttermilk at 10c	3.00
26	dozen eggs at 24c	6.24
		$28.99

This was one of the best loads of the season. Loads are taken every day except on Sunday during the Summer, and two days out of the week during Winter. We never use more than one horse unless the roads are bad, when we put a tongue in the wagon for two light horses. The best days for marketing are Friday and Saturday, and the best month in the year is July. In September and October the market is often glutted and prices are low. In March and April we often carry some valuable loads from the greenhouse. The only article in the above load that was forced was the tomatoes, as the outdoor crop had not yet matured. Of course, the above memorandum is nothing remarkable, as it could no doubt be duplicated by many gardeners.

D. L.

Indiana.

The 35-cent Dollar.

AS the following statement concerns the labor of a farmer's wife as well as the labor of hired man and farmer we give it here as sent to us:

56 baskets plums, Damson		$8.60
Express	$4.71	
Commission	86	
		5.57
Net proceeds		$3.03
56 baskets at $25 per M.	$1.40	
Picking, one man one day and board	2.00	
		3.40
Net loss		$0.37

My wife packed the plums and delivered at express office four miles. Where does she get her pay? I have done the pruning, spraying, once for scale and once for curculio, and have to pay the interest at 5% on $100 per acre land. The commission man got his which was perhaps none too much. The express company got theirs, which waas five times too much. The consumer will get his when he buys the plums and sugar and then kick because the farmer is getting rich. He will also kick because the farmer cannot sell wheat at 80 cents per bushel.

Query: Where does the farmer get his?

F. A. SEELEY.

Woman's Work in Business.

A and B, two young men, are about to buy a farm and form a partnership in the raising of chickens and other farm products. A is married and has four children, B is single. A thinks B ought to hire a girl to help with the housework, and that B should pay the girl. B thinks, being the house is run out of the proceeds of the sales before the profit is divided, that the girl should be paid the same way. Will somebody please give us some light on this as to the kind of contract that should be made?

Pennsylvania. F. G. B.

R. N.-Y.—As this has to do with woman's work we will ask some of our women readers to give an opinion. A must remember that if his wife and four children receive their board and lodging out of the partnership arrangement B is helping to pay for it. There are six in A's family to be fed against one in B's. On the other hand, what allowance is made for the work which A's wife performs? Here is a good question for women to discuss. It is probable that A's wife is wise in bringing up this point in the partnership.

Board Near College Town.

WE live in a college town, and thought that through THE R. N.-Y. I might learn of a girl who would appreciate a pleasant home in the country. We are only a half mile from the village and the trolley passes the door. We have good schools here. I should prefer a girl within the ages of nine to 14. I would offer a good home for $4 per week. This includes board and room, also some laundry. She would be required to pick up her room and help some with the work when out of school (meaning Saturday and Sunday). Knowing that there are men who are left with children, who would be glad to pay to have a woman look after their daughter, I thought that THE R. N.-Y. might reach such.

Massachusetts. MRS. A. F. T.

R. N.-Y.—We print this, following our plan of giving in this way the first statement of a suggestion for a new business for farmer's wives. This is something of a new idea. We have had several calls from women who live in college towns and would take young women students to help at housework. There are dozens of ways in which women may help themselves to business or companionship, and we desire to tell our readers about them. We print the first new suggestion—others should go in "Subscribers' Exchange."

An Auto Truck Gardener.

THE picture above is that of a new auto truck recently purchased by one of the most successful truckers in Central Pennsylvania, to haul his crops to market. The man by the side of the truck is Charles M. Smith. Nine years ago this man gave up a job in railroad shops to take up trucking on 10 acres of ground, and to say that he has been successful is putting it mildly. He is the man whose strawberry crop yields $500 an acre. Last year he raised a cantaloupe crop that brought over $800. People who know Mr. Smith and the number of acres of ground that he farms, wonder how he ever gets such immense crops off such a few acres of land. This man is a hustler; he studies everything new in horticulture and agriculture, and he is an authority on these topics. His goods are always in demand, and he is unable at present to supply all the trade that wants his produce. He has taken a course at State College; he has burned the midnight oil many a night studying; he is a good citizen interested in every good move for the interest of his community. His little farm is a model, and every inch of it is being made to yield fine vegetables or fruit. He raises big crops; he is raising a big family, and he is laying money away for a rainy day.

Mifflin County, Pa. E. E. CLAPSBY.

:: The Slender Woman's Hat ::

Good Taste in Head Dress

By Esther A. Cosse

FITTING THE HAT.—Little do large women imagine the difficulty slender women have in selecting their clothes, and they have more trouble with their hats than with any other part of their apparel. All women know that slender people have no trouble in securing articles to make them appear larger, or to make their clothes fit them better, yet, it is impossible to procure anything to make the head look larger, though one can procure extra hair, which will permit a woman to arrange her own hair full about her face, and to use the extra hair for decoration. Some wear it braided and pinned about the head in a coronet, while others prefer different styles. Any of these are suitable for a woman or a girl. The more hair she has the better a hat will fit. This is especially true of the woman approaching middle age, whose hair has started to fall out, and it is necessary to wear it very plain. But if such is the case, don't do it. Send your combings to a hair worker and have it made into either a switch or transformation. This will improve your appearance and cause your hats to be more becoming. Usually a small woman has a small head, and the shapes purchased have often been fitted to the head of a larger woman, in order to make it fit comfortably the average sized head. For the use of such people bands have been invented, but I do not agree with one who might say to use them in all cases where the headsize is too large. Of course, there are cases where it is necessary, but that is rare, and, in most instances there are better and easier remedies.

BANDS AND LINING.—To replace these bands several things can be done. One way which is especially good for the person with thin hair is to take cotton and cover it loosely with a piece of either black or white thin material, depending upon the color of the hat, black if dark; white, if light; sewing it to the crown one inch up from the headsize. The lining is then sewed in and the hat will rest on the cotton band. This should extend part way round for some, while for others, it is necessary to make it large enough to go all around the headsize. If the headsize is too large on either side, or both, and causes the hat to move from one side to the other, especially making it tilt the wrong way on the side carrying the trimming, cotton should be used in a different form. Make one piece two inches long and cover with material to correspond with outside of hat. Tack this outside of lining and to extend low enough to relieve the uncomfortable strain. Sometimes it is necessary to put one in on each side. Have you ever had a hat that when pinned with a hatpin seemed to draw just one or two hairs and if kept on any length of time, would cause headache? Many times I have had that trouble. To change that, rip the drawstring of the lining, and put in a running stitch, but leave it open and let the head slip to the top of the crown. Thus you will need but one good-sized pin, about two inches long to hold it at the back of the head where the hair is thick. This is a simple thing to do, but many would find it would not only make the hat look better, but it would feel very much more comfortable.

SIDE BANDS.—If one wishes to raise the left side it must be done by what we call a side band. This is made from a piece of stiffening, crinoline or buckram. Cut a band eight inches long and two inches wide. Shape it off on the ends, making the lower part round and the part sewed to the hat straight. Wire this all the way around. Pin the band to a double piece of material and cut out, leaving it half an inch larger all the way around; stitch across the bottom; fit to band; and slip stitch it across. Fasten firmly to the left side and side back of hat and trim with ribbon, flowers, or material corresponding with trimming. These bands are used for an under-brim trimming of feathers, such as is shown in illustration. Feathers are sewn firmly to brim and ends in some cases are stuck through brim and those left exposed are covered with a trimming of some description, but very little of it, as it will make the hat too heavy on the left side.

CHOOSING THE HAT.—In selecting a hat the first thing to be considered is the type of features. Is the face round or long? If round, use all round hats and odd shapes with points at different angles might be selected. If the face is long

SIDE TRIMMING OF FEATHERS.

choose long and broad shapes, but avoid angular lines. Trimming for all slender people must not be too tall, especially if the person is tall, and, in that case, it must be very broad. The slender woman has a huge advantage over the large woman in selecting shapes, as practically any odd shape, provided it be on right lines is usually becoming, while the stout woman must wear hats extremely plain, always looking her best in a tailored shape and style of trimming. Furthermore, the slender woman can and does wear fancy hats. By that, I mean, those elaborately trimmed with feathers, or shapes covered with fancy materials, such as lace, maline, chiffon, etc., while the more unfortunate stout sister must adhere to the rules and wear those made very plain, of straw braid, lace or maline, never daring to allow herself the pleasure of wearing a little lace ruffle, or a full trimming of any kind; but must use feather and flower stick-ups, or a trimming of ribbon with a few flowers.

A MODEL HAT.—A hat for a slender woman as shown in illustration No. 2, which I designed especially for a slender woman with a round face, is made of blue straw braid requiring one-half roll of black frame wire and pair of nippers or pinchers to make the following frame: Headsize 25 inches; cross crown nine

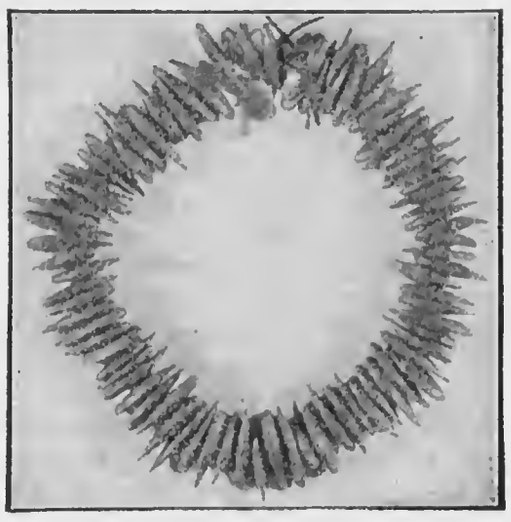
TOQUE OF STRAW BRAID.

inches; side crown 3½ inches; outside 36 inches; second bend 37½ inches; front of coronet ¾-4-5½ inches; left side front, side, side back, right side back, side, side front and back, the same. The coronet is made by bending wires straight up, or in other words in a cuff. In measuring off the brim dimensions, the first measurement is for the brim, the second for straight coronet and the third for the curve which is bent toward the outside. It doesn't mean that where first figures read ¾-4-5 inches, that each bend must be measured separately, but the tape must not be taken from the wire after starting to measure each wire. The distance between three-quarter and four is but 3¼ and 5½ inches but 2¼ inches. The frame is covered with crinoline, fitted smoothly, cutting crinoline to take out plaits wherever they occur; and, as one can see from illustration, the braid runs up and down the brim, but only over the curve. The wreath can be made at home by wiring small pink roses, blue forget-me-nots and small rose foliage, alternately. The crown is not fitted, but top is brought right to brim and sewed below second bend. It is covered with a piece of blue silk then with chiffon of same color, as is the loop made. The wire ear is made, and after sewing up loop on one edge, wire is slipped in and sewed on other edge then attached to the hat. The wreaths, if left long enough to extend upon the loop, adds much to the artistic appearance of shape. If the color is a little trying to the complexion, loop a row of black velvet ribbon, No. 22, around the brim. It is a beautiful hat, and, one making one like it would be very much pleased with it. It is one especially designed for a slender woman of round face, and when making it one would find the shape perfectly round, but it should be bent so it is a trifle longer than wide: To make it one would require:

One half roll frame wire	$ .10
One spool tie wire	.10
One yard crinoline	.10
5 yards braid at 8c	.40
½ yard of silk, 59c	.30
½ yard of chiffon, 59c	.30
2 bunches pink roses, 19c	.38
2 bunches forgetmenots, 15c	.30
2 bunches foliage, 19c	.38
	$2.51

A Melon-Seed Chain.

I WISH to pass on to the children of THE R. N.-Y. family a discovery my 10-year-old daughter made. For a very



MELON-SEED CHAIN.

pretty chain, take muskmelon seeds, wash and spread on paper until partly dry, then, with a needle and double thread string them irregularly until long enough to tie and slip over the head. Then dye any shade desired. We had pink dye in the house and used it, making it look not unlike coral. Children any age enjoy doing this, as we found by interesting the children in our neighborhood. A sample of the chain is shown above.

Conn. MRS. CHARLES TURNER.

"The Woman We Like."

The woman we like feels that a story told to hurt another's feelings or air failings is very bad form so she avoids it herself and discourages it in others.

She is very mindful of the little courtesies to the old, enjoys a laugh with the young and is a good listener as well as interesting conversationalist.

She does not judge people by their clothes but by their actions, yet is not a critic, seeing noble traits of character as readily in the washwoman as in her most fastidious caller.

She is very sympathetic to children, enjoying their joys and helping them through their troubles.

She by these acts brings out the good side of our nature and makes the worst of us, quite companionable so we are lifted up from a lower to a higher plane, and that is why we love her.

Virginia. MRS. J. N. LUDINGTON.

The Rural Patterns.

When ordering patterns give number of pattern and size desired. Price of each pattern, 10 cents.

7608, Housejacket with fitted back; sizes 34 to 44 bust measure. 7607 Kimono with set-in sleeves for misses and small women; sizes 14, 16 and 18 years. 7163, Long or short kimono, small 34 or

36, medium 38 or 40, large 42 or 44. 7595, Child's pointed yoke dress, sizes 1, 2 and 4 years. 7778, Child's tucked and plain guimpe, sizes 2, 4 and 6 years.

8050, Semi-princesse gown, 34 to 42 bust measure. 8369, Gown with long cir-

cular tunic, sizes 34 to 42 bust measure. 8266, Raglan coat, sizes 34 to 44 bust measure. 8283, Boy's blouse, sizes 4, 6 and 8 years. 8291, Infant's set, one size, dress and two petticoats.

7501, Girl's five-gored petticoat, sizes 8, 10 and 12 years. 8043, Child's one-piece nightgown, sizes 2, 4 and 6 years. 7088, Work Apron, sizes 34 to 44 bust measure. 7577, seven-gored petticoat, sizes 22 to 32 waist measure. 7248, Work or studio apron for misses and small women, sizes 14, 16 and 18 years.

From the Home Dressmaker.

FORTUNATE indeed is the woman who can buy new clothes this year, for there is a decided change in both waists, skirts and coats. By having things made in the very latest fashion one will be able to wear them the second season and be perfectly up-to-date; and if necessary, the third season by a little judicious change in the trimming or accessories.

WAIST.—First in importance is the corset, for if the old-fashioned corset, which curves in at the waistline, is used it will be impossible to make a dress or coat look up-to-date for the waist is larger than ever before, so that it is almost a straight line from the arm down to the hip. There are no more "flopping" full waists and sleeves, but the plain, straight basque, opening either down the front or back, this latter being the latest. They are apparently fastened with buttons and buttonholes, but in a great many cases the buttonholes are only simulated, and the fastening is really made with hooks and eyes. In other cases the buttonholes are bound with a contrasting material, as for instance satin, when the dress is of serge or cashmere. Buttons are used on everything, and they are of all kinds and description. Also all kinds of beads and bead trimmings are used even on broadcloth, serges, etc.

BASQUES.—To return to the basques. These are sometimes made separate and other times they are fastened to the skirt. In the latter case very often a narrow sash from four to six inches wide is used and just tied once with long ends hanging down. Plain velvet basques with skirts of other material, though generally of the same color, will be worn, and right here is a chance for the economical woman who has an old velvet or velveteen skirt laid away, for there should be enough in one of them to make one of these basques, for the sleeves could be made of some other material like chiffon, net or satin, and the length of the basque helped out by a broad sash or girdle. The sleeves are generally the long, close-fitting, set-in variety, when of heavy material, and slightly fulled when of net or chiffon; the former being finished with some kind of a cuff and the latter a frill. The new basques are more difficult to make than when basques were in style before, for the reason that the latter were tight and boned, so that if once buttoned they would stay in place but these new basques this year are made with only a thin lining to hang straight from the shoulders *without* any bones at all, but when they are made separate from the skirt weights are used to keep them down. It is needless to say that they must be perfectly cut in the first place to insure their keeping in shape, for they are only semi-fitting and must in no case look tight anywhere, but just as if you were wearing a very comfortable dress that had been made for just you and not for somebody perhaps half a size smaller than you. To be sure clothes should always look like that, and that is the stamp of the first-class tailor or dressmaker, but when things are made fancy or full and "floppy" as they have been for the last few years (I mean the waists in particular) you do not notice readily mistakes in cutting and fitting. The other dominant note about waists is that everything outside of the plain basque has a wide girdle, the newest ones being perfectly plain—that is not wrinkled and crushed—and they start in just below the bust and go down well over the hips.

SKIRTS.—The three or four-gored circular skirt is the newest and I was told by one of the leading New York authorities on dress, that no skirt to be in style this Winter should be less than two and three-quarter yards around. Two of the well-known French houses, it is reported, have made their models four and five yards around. But of course those are rather extreme. If the skirts are made perfectly plain, they usually ripple around the feet, but for a stout person those with side or front plaits stitched down to give a yoke effect and the plaits well pressed are much more becoming. Box plaits of all widths are used on skirts in all sorts of ways, but when the skirt is plaited all around it is made with a plain yoke at the top.

COATS.—The coats are very long and tight fitting until just below the broadest part of the hips when they begin to ripple, being very full at the bottom. Some of the coats reach to within a few inches of the bottom of the dress skirt.

MATERIALS.—Broadcloth is *the* favored material for dresses and suits this Fall, and velvets, velveteens, plush and cashmere and serge will also be used. Plaids and Roman striped materials continue to be very popular, but will probably not last beyond the Spring. Braid has come back into its own again and will be seen on all the new suits and wraps. The favorite is black silk braid, which is often used to bind the revers, collar, cuffs and edges of the coats.

MRS. B. B.

The Scientific Buttonhole.

THIS is the scientific process of making a buttonhole as told by Miss Annabel Turner of the Wisconsin University:

Buttonholes should be worked on the right side of double material, at least one-fourth of an inch from the edge of the garment. The distance between them is regulated by the material and by the size and location of the buttons. The beauty of the buttonhole depends largely upon the straightness of the cut, the regularity of distance between the stitches and the evenness of the stitches in depth. Make buttonholes firm, with a fan at the end receiving the strain, and finish with a bar on the other end. A vertical buttonhole with strain at either end should be finished with a bar at each end. Use thread to correspond with the weight of the material. Let the thread be long enough to work the entire buttonhole.

To make a buttonhole cut a slit the required length through both thicknesses of cloth, being careful to cut between two threads. Knot the thread, insert the needle half an inch above the right end of the slit, bring it out three or four threads below the right end of slit; insert the needle three or four threads below the left end of the slit, bring it out three or four threads above; insert again above the right end, coming out at starting point, three or four threads below the right end of the slit. If the material frays easily the slit should be overcast before attempting to buttonhole. Begin the buttonholing by bringing the needle about half way out at the lower right end just below the long stitch. Throw the double thread from the eye of the needle to the left and under the point of the needle with a circular movement to form a loop; draw the needle through the loop formed and pull up the thread away from you at right angles to the edge of the buttonhole, thus forming a double knot on the edge called a purl. Form the following stitches in the same way, leaving a thread of the cloth between each stitch and bringing the needle out under the same thread of the cloth each time to make the stitches the same length. In making a horizontal buttonhole spread the stitches at the left end in fan shape, continue down the other side, and at the right end make two stitches the length of the width of the buttonhole, drawing the two sides together. Wind the thread spirally around these long stitches until completely covered, carry the thread through to the under side and fasten.

BATHING SUITS IN LOUISIANA.—Having a large family to sew for my pet "saver" is the making of one-piece garments. All gowns, aprons, middies, little boy's suits, princess slips, etc., are made in one-piece patterns; they fit very nicely, are cool, comfortable and best of all pretty. It takes less goods to make them and is an economy of time, strength and money. Another successful experiment of mine this Summer, that I must pass along to the mothers who have plenty of sewing, is, instead of making rompers, a tiresome job, for the little four and six-year-old, buy the little navy blue, sleeveless bathing suits, all in one and let them wear in the mornings. Although miles from a beach, mine are dressed in their bathing suits every morning. They are easily rubbed out in a basin and are fresh and clean without ironing. I bought six at 25 cents each, and the saving in wear and tear, washing and ironing, sewing and mending, health and happiness, has been tenfold. Try this, busy mothers, next Summer, and I am sure the result will prove a delight. MRS. S. P. V.

Patterson, La.

MOTHER: "Gerald, a little bird has just told me that you have been a very naughty boy this afternoon." Gerald: "Don't you believe him, Mummy. I'll bet he's the one that steals our raspberries."—Punch.

Three for $1.00

42A73—Three garments for $1.00. Madam, it is just such bargains as this that have made the "NATIONAL" famous. This bargain offer includes one Dress of cadet blue Plaid Percale trimmed with solid color percale; one Dress of medium grey Striped Outing Flannel trimmed with cadet blue percale; and one cadet blue Chambray Apron. SIZES: 2 to 6 years. Sold only in sets of three—one of each kind and all one size. Order today.

Postpaid, **Three for $1.00**

We Take All the Risk

Don't hesitate to order these bargains from the "NATIONAL," because we take all the risk of your being pleased. We pay all transportation charges and refund your money if you are not satisfied.

12A73—Here is a money-saving opportunity for you—one of Winter's newest and warmest Coats—handsome in appearance and very serviceable—and the "NATIONAL'S" money-saving price is only $4.98. It is a becoming, loose-fitting model of Astrakhan Cloth, with smart raglan sleeves, and the fashionable collar of self-material is trimmed with rich black seal plush. The graceful lapels and deep cuffs are of self-material and large black plush buttons trim the cuffs and effect the closing. Lined throughout with durable sateen. COLORS: black or navy blue, each lined with black sateen; also medium brown lined with self-color sateen. SIZES: 32 to 44 bust; 48 inches long in back. Order this coat today and see for yourself its value.....*Postpaid*, **$4.98**

13A73—Same as 12A73, but made 52 inches long in back.

Postpaid, **$4.98**

1A73—Make this handsome Dress your dress—enjoy its smart style and beauty and becomingness and enjoy the cash saving it offers—for dresses of equal quality are priced at $8.50 elsewhere. Lustrous Satin Messaline is the material used, and dainty cream-white shadow lace is used for the standing collar and vest, the turned-down collar and sleeve frills. Full-length sleeves and girdle of self-material. Invisible front closing. White lawn waist lining; inner belt and shields. Fashionable box-plaited Russian tunic and comfortably wide underskirt on lawn foundation. COLORS: black, navy blue, Copenhagen blue, taupe grey, or medium brown. SIZES: 32 to 46 bust; skirt length 39 to 41 inches, with three-inch basted hem. In ordering, give bust, waist, hip measure and front skirt length. Here's a cash saving of at least $2.50 for you. Order today.....*Postpaid*, **$5.98**

Your money back if you want it

A Glove Bargain

46A73—Value $1.50—our price, $1.00. Very warm and serviceable Gloves of Fleece-Lined Suede. Half-pique sewn and three rows of stitching on back. COLORS: tan, or grey. SIZES: 6 to 8½—in half sizes. Perfect-fitting and very serviceable. Order today.....*Postpaid*, **$1.00**

NATIONAL CLOAK and SUIT CO.

273 WEST 24TH STREET, NEW YORK CITY

Mother's Sewing Room

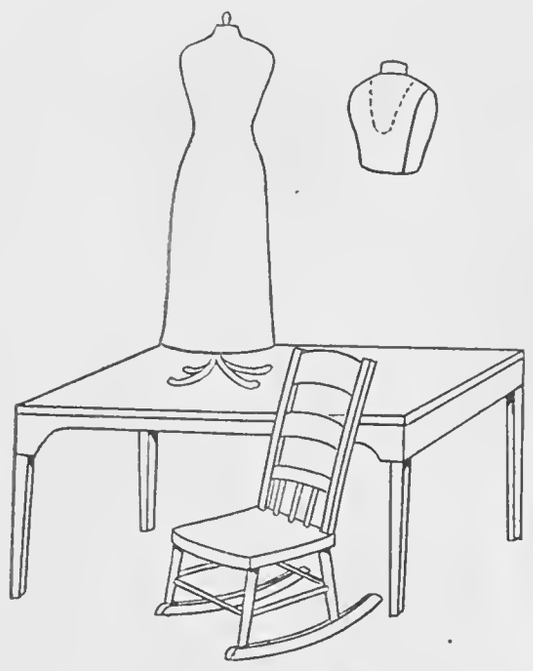
Farm Dressmaker's Work Shop

"By a Farmer's Wife"

PART II.

SHRINKING GOODS.—At first I was quite suspicious of silks and wool goods. However I find that textiles are very much like people—the more durable and better the quality, the more one likes them upon acquaintance. At first when buying woolens I had them shrunk at the tailors, this cost 25 cents, but I soon learned that I could do this at home by wringing two or three old sheets out of water, and spreading upon the floor, then laying the goods out full length upon them, and beginning at one end and rolling up the whole piece and letting it lie over night, possibly longer. I found the goods would be nicely shrunk. I usually press a little under a cloth afterwards. I find it better to shrink all wools and nearly all wash goods before cutting into them. Ginghams and shirtings are put into a tub of water, then hung on the line to dry, after which the cloth is dampened for ironing, this makes a second shrinkage for these before making up.

USE OF PATTERNS.—I always choose the simpler patterns and when about to make a nice dress, usually make a cotton from that pattern first. I am then familiar with it, and find it not only easier



"MARY JANE" THE FORM IN PLACE.

but often can save material. The same waist or skirt patterns are sometimes used several times with variations. I find I can work far more rapidly with the pattern that I have used before. When in doubt concerning anything I often write the editors of the fashion magazines, enclosing a stamped and addressed envelope for reply. I find they are very willing to help me. I judge this by the length of the replies which they send. I have come to do the larger part of my shopping by mail. This is much easier than going to the village and one gets a better assortment by sending to the cities for samples of goods, and especially trimmings, than are usually kept in small places.

BUYING TRIMMINGS.—It is well to send a piece of the goods to be made up to two or three different stores asking for samples of trimmings to match or harmonize; the result will be very satisfactory. In making up a cloth dress, a nice finish is produced by sending a piece of the goods to a merchant tailor and having buttons made to match the dress. These buttons can be had in two styles and any number of sizes. One style is plain and the other has a rubber ring around the outside. These latter in two sizes make a very desirable trimming for a plain heavy goods.

CAREFUL WORK.—In making up almost any goods, it is well to do a generous amount of pressing, and in a heavy wool dress or coat one needs to press, press, press, each step. This gives a neat tailored effect. I am hoping to have a gasoline iron, which will be a great addition to my sewing room equipment. After cutting out the dress I have found it best to baste and fit the waist and get this pretty well done, then putting it on the form a belt is pinned in place and the skirt adjusted to this, after which "Mary Jane" is lifted to the low table where, by taking the sewing chair, I can easily turn the hem. I use different sized spools, according to the length of skirt desired, a large spool for shorter lengths and vice versa. In adjusting darts, I pin them to fit on the right side; after removing from the form the garment is turned and chalked on the wrong side, when the pins can be removed and darts basted in without difficulty. For holding skirts fast to waist, the wide hooks and bars which are used upon the front of men's trousers, are the best of anything I have found as yet. All boys in our family have given me a generous supply from the cast-off garments, but these could undoubtedly be bought from any tailor. Much of the elaborate effect of dresses is produced by a combination of trimmings upon a rather plain foundation. Nothing gives the amateur dressmaker away more than an ill-fitting, loose guimpe or yoke, one that is always pulling out somewhere. To prevent this it is a good plan to make a foundation of white lawn, long enough to come to the bottom of the waist both back and front, where it can be securely fastened with a tape. The yoke material can then be put upon this, the lawn cut away underneath and a lining of thin silk or silk and cotton substituted. A narrow strip of canvas (bias) put underneath facing of the dress insures a smooth fit around the opening and this is where the little snap fasteners are desirable in attaching the dress to this yoke. An easy way to adjust them is to mark both dress and yoke with a piece of chalk. A fresh yoke and perhaps buttons will brighten a dress very perceptibly; that is why it is well to keep some netting and button moulds on hand. Often an old guimpe can be cleaned and retrimmed with very little effort, producing a very pleasing effect.

SMALL DETAILS.—By beginning at one side of a sleeve and stitching across the bottom, then on around and across the bottom again to the other side, one will strengthen the wearing qualities of the sleeve very materially. Another help is to baste where a buttonhole is to be cut and then stitch around it, thus holding the goods in place while working. When sewing on silks, if thin, it is a good plan to put a paper underneath when stitching; this will tear away and it makes the stitching look so much better on the right side. All selvage edges are clipped about two inches apart, this prevents that drawn look sometimes noticed on seams. All braids, taped and finished braids, should be shrunk before using; it is well to do this before they are put away as sometimes one wants only a little piece and that in a hurry. Fine needles should be used for pinning silks, as these leave no mark. Rubber mending tissue, used by tailors to fasten hems around the bottoms of men's trousers, is a very necessary article to keep in hand; 10 cents worth will last a long time for repairing little rents in dresses and coats.

OTHER HELPS.—The fashion magazines print a good many lessons in dressmaking designed especially for the home sewer. These are very helpful; however, I find it necessary to re-read several times before I fully understand their meaning, but it is time well spent. The catalogues issued by many of the city houses are a great help also.

ECONOMY IN APRONS.—Several years ago I had just enough dress ginghams to make seven aprons; these were reinforced underneath across the front, and were used alternately, the clean ones always being placed on the bottom of the pile. These seven aprons lasted three years for constant everyday service, when, much like "The deacon's one hoss shay, which was built in a logical way," they nearly all went to pieces in a day. Then I made another set of seven, this time from a nice quality of shirting (so-called apron gingham is not worth while, as it shrinks and fades so much). This set will soon complete its third year and will last longer than that, as they are all good yet. Reinforcing across the front with the same goods is a great promoter of long life for an apron. I also made an apron of table oilcloth, for dishwashing, the same way as the others; this is one of the best investments I ever made. I always watch for helpful hints in all magazines and papers, finding much that I can appropriate for my personal use, and I trust the reader may have gained a hint or two from this.

FARMER'S WIFE.

My Experience With Wash Goods.

"THAT gingham-veiling-crépy kind of stuff is rather pretty," said the guest as she looked over a fat envelope of samples. Other samples from other cities showed variations of the same goods most in demand this Summer, crépes, voiles and ratines. There were a few

THE YOUNG POTATO GROWER.

samples of tissue, a fabric thicker than batiste and thinner than gingham. What my guest admired was a crépe voile in Copenhagen and white. I much admired a plain ratine in rhubarb pink. One fabric that is very attractive and combines the three popular weaves is a ratine-striped crépe voile. This is not expensive, drapes prettily, but a beautiful gown of it shows a tendency to break close to the ratine stripes. The silk and cotton crépes are the prettiest things I ever saw at 50 cents per yard, so soft and clinging. They seem to wash and wear well. Some of the daintiest old-fashioned patterns are reproduced, such as little stiff bunches of impossible roses.

A whity-brown suiting linen pleased me, the natural color is harsh and white soils so quickly. There was one dainty crépe at only 15 cents per yard, plain white with a tiny blue forget-me-not on it. One weird sample showed stiff lavender roses on a tango ground. In the tissues, at 25 cents, were the prettiest assortment of gray and white, plain gray and black and white fabrics for elderly women I have ever seen. I had no idea it was so hard to get attractive goods in these colors until I spent much time shopping with a dear old lady who wanted a

"MUSIC HATH CHARMS."

waist for everyday housewear. We visited many stores in several places before finding anything passable.

Eden cloth may now be had in good plain colors; it looks like French flannel and washes and irons easily, but shrinks a little, so one must allow for this in the length of skirts. It makes good sailor suits and house dresses for cool weather and costs 15 cents per yard. Serpentine crepe wears finely but stretches out of shape badly. Dresses made of it have to be pulled into shape while drying and skirts need rehanging about every time they are washed. Tissue crepe is pretty and moderately satisfactory; this shrinks in length and gains in breadth with each visit to the tub. Nurse's cloth is an English fabric that one cannot always get. It is yardwide at 50 cents per yard. It does not fade nor shrink and wears forever. There is one exception, the red turns brick color after one washing. For children's cool weather dresses, house gowns and little boy's suits, it cannot be beaten, if you are lucky enough to get it. The real Indian head linene is substantial but very hard to iron at first, as warm as thin wool and never wears out. Linene launders more easily than linen but only imitates the real thing. Percale is very successful in the light colors. In plain white, at 25 cents, it makes very satisfactory blouses. In gray, it makes the most practical and best-wearing kitchen aprons we have ever had. Galatea wears like iron, shrinks a good deal and the outside wears off with hard usage. It is too warm for any but cool days. The prettiest coat and skirt suit I ever had was made of white galatea with a little black stripe. It was known as my "serge" suit and admired by people of wealth. With ripplette, after washing it dries harsh and the ruffled stripe is hard to get clean. Figured crépe is apt to look untidy unless very lightly pressed after washing.

Flaxon is about the daintiest fabric there is for thin goods and wears splendidly. Don't make the mistake of buying wash dresses too small and do try to keep the skirts an even length. It pays to shrink all goods before using. Our method is to pour boiling water over the goods, let stand all night, hang out dripping wet and dry in the shade. The wise woman merely has her lengths of goods put through the family washing, then hung out dripping. Still with all this, some goods will shrink a little the first few washings. Remember that one can often save laundering a thin dress that is only crushed by sponging it lightly on the wrong side with warm water and borax, then pressing it.

If you can't match your dress in canvas shoes, mix a little dye with some of your white dressing and make your white shoes the color you want. Camisole lace can be bought with beading at top and bottom and only needs ribbon matching your dress to be ready to wear. The new V-pins are pretty to wear with V-neck waists, and I like the wide soft suede belts. But the ribbon sautoirs to wear a watch around the neck do not strike my fancy.

EDNA S. KNAPP.

A Coming Potato Grower.

THE picture here shows a little farm boy and a part of his crop of potatoes. Some of the potatoes appear to be almost as large as the boy's head, and we can see how proud the little fellow is of his crop. It is a great thing to have a child interested in work of this kind. No one expects a little fellow to do a full man's work. Many a time he will want to stop and play before the job is done, and unless some one can keep after him in a kindly way, the child will be sure to neglect part of his work or let the weeds grow where the plants ought to be. It is a fine thing to be able to organize the work of these little fellows and get them to feel that they have really accomplished something without being made so tired that they feel that all work is disagreeable. All farm children should do their share of the work, but they should be made to do it in a kindly way, not driven to it like little slaves. This boy looks as though he would make a farmer some day and he is certainly on the right track.

"Music Hath Charms."

THE little picture here shows a pair of musicians who are certainly making fun and making music. This was probably taken after supper, and that is a good time to make music on the farm. The little fellow, who is riding horse on the man's knee is trying to keep up with the music, and while he may not be in time or tune, the chances are that the man would rather hear him play than to listen to the finest musician who ever came across the water from Europe. It is a beautiful thing to have the confidence and the affection of a little child. There really ought to be three broods of children on every farm. Probably the second and third brood would have to be adopted, but many a farmhouse stands cheerless and out of use today because there are no children in it to make music and fill it with joy.

The Land of Fulfillment

A Story of Homesteading

By Rose Seelye-Miller

(*Continued from page 1065.*)

Nate and Norm had plenty of ideas and plans of work that would keep them busy till Christmas, but on the 30th day of October a little snow fell. It kept on falling from day to day, until the ground was too well covered to make continuous ranging possible for the stock.

Each day the horses and oxen were turned out, and each night they were stabled with comfortable mangers of hay and grain in their feed boxes.

No anxiety was felt, for even the old settlers agreed that they had never seen a snowy Winter. A little flurry now and then, but no heavy falls, and it was prophesied that the snow already accumulated would soon go off, when a thaw should come, which was daily expected. But the snow did not go, nor a thaw come; instead the snow kept falling more and still more. It drifted into the valley space heavily. The chicken coop, built there for shelter, had to be dug out each time it stormed. The hay, too—what little there was—had been stacked as made in the valley plat, and this, too, had to be dug out each time a fresh load was needed.

"If this should keep on," Norm said, breathlessly, resting a moment from his shovelling about the haystack, "I'm wondering where we'll get hay to keep the stock alive through the Winter. I don't see why I hadn't sense enough to put up more. This valley would have fed 50 horses, and the few we have will starve long before Spring."

"I haven't any sense about things like that," Nate admitted. "But I wish we had put up more hay."

"Even if we hadn't burned the straw," Norm wailed. "Last year I looked for Winter, and was ready for it, but no Winter came; and here in November we are covered up with snow, and no sign of a let-up."

"What are we going to do?" Jim Maynard asked one morning, standing near one of Nate's shivering horses. "My critters are half frozen, and I haven't enough hay for them into the bargain. They eat as much again when it's so cold to keep their heat up. I—I'd hate to shoot 'em; but it seems to me I can't stand by and see 'em freeze and starve."

"We haven't half enough hay, either," Norm said, sympathetically, "and we haven't stock enough in the barn to keep it warm. I wonder if we could crowd your stock and ours in together, at night, anyway, and so keep them warm by their own heat." So the livestock were sheltered together, but the hay in the valley dwindled and dwindled away, to such a degree that the oxen were turned out to rustle as best they might, and the hay was doled out to the horses and cow sparingly.

Then came another serious problem. The fuel laid in for Winter had seemed generously adequate in the Fall, but much more fire had been needed than the previous Winter, and the fuel, too, dwindled away rapidly. The climax was reached when Norm came home from a trip to Wetasket after coal, without it. A coal famine was on the land, as well as the hardest Winter ever experienced by the oldest settlers.

"We'll have to bunk in the barn with the cattle or live in the cellar," Nate said cheerfully; and when Norm had gone out to take care of his team, Nate went down into the cellar, which was warm and dry. The shale beneath made it as dry as cement, and Nate, looking into the hole Hank had dug, remembered the stone ovens used by the Dagoes when they were doing railroad work. He believed that he could build a small fire in the hole, which would not only cook the needful food, but also make a sufficient warmth for comfort, for the shale would hold the heat like a vast soapstone footwarmer. Nate took the top off of a small laundry stove—a variety much affected by the early settlers, as giving a maximum of heat and top surface. This he fitted over the smal hole in the cellar, and from the stove top he run a length of pipe to the room above, and thence out through the roof, for this, too, was the only chimney the settlers' cabins had—a length of pipe run through the roof. Nate started a small fire in the little shale pit, and in a few minutes the small cellar was as comfortable as need be, and Nate felt that the fuel problem was solved for the time being, for very little would be needed in this basement kitchen, as he was pleased to call it.

Norm came in growling: "What! no fire and no supper?"

"'Will you walk into my basement, said the cook unto the crowd,'" parodied Nate, and he led the way to the piping hot supper below, laid out on a box, which was spread with a clean paper.

"What dido are you up to now?" inquired Norm, somewhat appeased by the savory odors and the comforting warmth.

"I'm just playing Dago," Nate replied. "I've seen their fire pits a hundred times, and their good sense, too. We can heat this cellar, and it will hold heat for hours and hours and hours."

"You must be a descendant of Robinson Crusoe, for you have a scheme for everything. Now, if you can find some substitute for hay."

But no substitute was found, and the feeding problem loomed large and larger.

"I believe I've scraped up the last forkful of hay," said Norm one morning, as he tossed his pitchfork on to the hay rack on the sleds. "Now we've got to do something. Somebody must have been provident, and somebody must have hay. I'm going to start out and travel till I find some. They ought to be shipping in to Wetasket."

"Couldn't the stock get along with just plenty of grain?" Nate asked with his lack of farming wisdom.

"They must have roughage. But we'd try to keep them alive on grain for awhile if we had to."

"I'll go along, too, then, after I've put a kettle of beans to cook in the pit." In doing this Nate managed to slop a good deal of water, but it only hissed on the hot shale and did not put the fire out. Taking some bread and meat in a paper sack, and buttoning his sheepskin-lined coat up well, Nate was ready when Norm drove up with the team and the hay rack. They made haste but slowly, for the roads were full of snow, and practically unbroken. More than once the shovel was brought into requisition. Inquiries were made all along the way for hay—if the settlers had any, or if they knew where it could be had; but none could be found to sell. Some had enough to pull through and some had not burned their straw, but the majority were about as anxious as were Nate and Norm. Norm went about to livery barns and feed dealers and to farmers, but he found no hay for sale.

"Why don't some blamed money-grabber ship in some hay?" Norm asked in disgust as his last hope failed.

"Why don't they?" cried Nate. "Why don't we? We'll wire Mansfield. He knows all about the country travelling as he does for machinery. He'll tell us where to hunt for hay, and we can ship it in ourselves."

"And we've been worrying over that!" Norm's face lit up with a smile, brighter than it had worn for a great while. So the wire was sent, and the reply came, cheering, inspiring.

When the telegram was at last handed out Nate tore the envelope off and read:

"Hay in Edmonds County. Bale and ship. Good money.

"MANSFIELD, St. Paul, Minn."

"You'd better go, Norm. You are worth a dozen like me." And Norm took the first train to Edmonds County, and travelled until he came to a region abounding in generous haystacks.

"Yes, we've got hay and straw in plenty," one old settler told Norm, "for we've lived in Dakota long enough to know we do have Winter sometimes. This is a new country right here, but I've lived in Dakota for a good many years." So Norm bought and baled hay, and Nate canvassed the country for buyers, until all were supplied.

There was no money in it, for neither one of the boys wanted to make money of people who were just as limited in circumstances as they were themselves. Still the expenses were all paid and the situation saved. When at last enough hay had been shipped, and Norm was ready for home, he felt that he was leaving a place of very pleasant people and much comfort. Still he was glad to get home again, and Nate held a jubilee of welcome for him. The coal famine had lifted, and the rest of the Winter passed uneventfully enough. To be sure, Norm had been absent from his claims for some weeks, and Nate, too, had been absent from his, for he had lived most of that time of coal famine and hay scarcity right in Norm's shack, because it was much better fitted up than was his own, besides being much nearer the stables, while the valley was so filled with the snow the usual access to his own shack had long been blocked and his shanty practically snowed under. Still there was no anxiety regarding the matter, as when the weather moderated the boys shoveled through the snow, and made Nate's habitation possible of access and comfortable to live in. The boys had part of their meals there, and Nate slept there, for the sake of holding his land by actual residence.

With the breaking up of the snow the creek, that had never been more than a rod wide and from four to six feet in depth, began to fill up. But so gradual was the melting of the snow, and so deep had the Winter's fleece drifted into the valley that the water seemed to make little difference in the creek itself, until there suddenly came a warm rain and a rapidly rising temperature.

"If this warmth lasts we shall get into the fields before long," Norm said jubilantly, as he parted from Nate at night.

I can hardly wait," Nate replied joyously. "I'd like to wake up and find the ground bare in the morning."

"Oh, I don't know as that would be as much of a blessing as you think. Better have it thaw slow, and soak the ground, than run in a stream into the valley and creek. Why, there's snow enough now in the valley almost to flood the land if it melted fast."

"And the water has been dribbling in there, too, for days. There's no telling how much water there is beneath that white crust," Nate agreed, quietly. "Well, we'll have to take it as it comes. I can't help but wish the chicken coop was on the top of the bluff, instead of in the low place."

"It has been a good warm place for the Winter, but if the rain holds and the weather is warm to-morrow we will move the chickens to the barn until the danger of the creek overflowing its banks is over."

It was grey morning when Nate awoke and looked out of his small window, to find the snow sodden and black with rot, the whole aspect of the country so changed he hardly recognized it. A strange, sullen, roaring smote his ears, and the noise seemed to grow louder and louder as he listened. Suddenly remembering the prophesy of Norm, and the peril of the chickens, he thrust himself into his overalls and rushed outside, to discover that the creek which had been such a peaceful stream, almost unrippled in its course, was swollen to a roaring torrent. It had overswept its banks by far, and had crept up over the valley in a flooding depth. Nate looked at the sullen darkness of the waters in amazement, and as he watched he saw the chicken coop caught on the swirling tide and swept past him. While Nate stood perplexed on the bank Norm appeared on the other side.

"Our garden patch is getting a good irrigating," Norm shouted above the noise of the waters.

"So are our chickens," Nate shouted back, pointing to the coop careening on the flood. "Get a picket rope," he cried, "get all the rope you can." And while Norm dashed away for the rope, Nate flung off his coat and boots, and cautiously essayed to descend the slippery shale of the high bank. Norm caught sight of him as he disappeared around a curve of the very crooked stream, and he ran swiftly along the bank, keeping Nate well in sight. When he had come abreast of the coop, Nate threw himself into the water, intending to catch hold of it and fasten it with the rope Norm had brought. The force of the stream was much more than he had reckoned for, and he found that his ability for swimming came into no requisition save to keep him in line with the floating coop. This object of his rescue seemed constantly to elude him. The water was icy cold, and Nate was so unpractised in the art of swimming that his chase after an ever-vanishing thing began to wear on him. Norm, running along the bank, saw the suddenly relaxing powers of his comrade, made a slip noose in the rope, and with a wild fling tried to lassoo him, but he had not been quick enough. Without a word, or cry, a sound, Nate went down into the surging, crashing flood. Norm thought wildly of the jutting stones in the bottom of the creek, of the sharp out-cropping of the shale, and he grew sick and faint, but this did not prevent him from flinging off his own coat and boots, and almost as quick as Nate had gone down Norm was in the water, waiting for the reappearance of his friend. But when he did come up it was at such a distance that Norm could not reach him, strong swimmer though he was. Almost he could reach him, almost he could catch and save him, but too late, too late, did his strong arm shoot out to grasp the sinking boy. With a quick indrawing of his breath Norm dashed up the bank; he did not know how he scaled the slippery steep, but he caught the rope he had discarded and crashed down the bank again to the very verge of the boiling water. With straining eyes and suffocating heart he waited, and he prayed—not that Norm knew himself to be praying, but his heart went up in a wild cry of anguish, "Lord, save him! Lord, save him!"

Economy.

THERE are three meanings commonly applied to the word economy. First, going without; second, using sparingly; and third, using to the best advantage. Transpose the letters of this word into two groups and you have *co-*(with) and *money!* Plainly economy means—with money! Remember there can be no economy where there is nothing to economize. Living from hand to mouth may, in some cases be a necessity, but it is never economy. Many believe that in order to be economical they must be stingy, buying and using only the smallest possible part of the things that would make their lives happier and more complete. There are those who have an abundance of means by which they might enrich their lives and the lives of their family, but through false ideas of economy they save here, there and everywhere, stinting themselves on everything, narrowing their hearts and lives and losing the joy and contentment which might be theirs. A shining contrast to these are the persons who having a limited income lay aside a small portion for the rainy day and use the larger portion for the brightening and ennobling of their own lives, and the lives of others. These are the truly economical people and the truly happy ones.

New York. ETHEL D. MC NICKLE.

The Housekeeper's Creed.

I WILL conserve my own resources of energy and time by having dry mop, duster, brush and dustpan on each floor: having matches and receptacles for burnt ones in each room; having no dirt gatherers under a mistaken ideal of decoration; having pencil and paper in each living room, to save a fleeting thought; having list in kitchen on which to jot articles to be bought, things to be attended to later, et cetera; having plenty of soft paper at hand in kitchen for wiping out greasy dishes, for lamps, and so on. The paper will do for lighting fires too.

Putting my dishes away so that in order to get one I do not have to lift or move two or three.

I will hang clothes on line to dry smooth, and will fold, when dampened by dew, as taken from line. Those that are not to be ironed I will take from the line while dry in the sun and put away.

I will sort clothes on the horse as I iron, and keep those needing mending by themselves. This saves one handling.

Will keep white and colored buttons in separate boxes with threaded needle and thimble in each box. This is a great convenience.

Will put my spools of thread away number side up.

Will label every box and bag as to contents, from attic to cellar.

So far as possible will follow the same order each day in doing the duties of the day. The time thus saved will be spent in reading, music, or resting and thus preserve my disposition from being frayed by nervous strain. So shall I "serve with joyfulness and with gladness of heart for the abundance of all things, as the Lord thy God" directed. DORA MORRELL.

Maryland.

Moving Made Easy.

EVERY Spring and Fall a large percentage of our "great American family" undergo what is frequently called the "agony of moving." Whether this moving is simply from flat to flat in the city, or from farm to farm in the country, the hard work and discomfort are much the same. But moving may be greatly simplified if you will try this "work reducer." Instead of getting all the furniture into a jumble in the old house, and moving it helter skelter only to leave it in wild disarray in the downstairs room of the new home, use this orderly method: On each door of the new house tack or paste a good-sized number, as No. 1, living room; No. 2 on the dining room door, etc. Then before mixing up the furniture which is to be moved from the old house paste or tie a numbered tag on each piece. All living room furniture will be No. 1 and will be placed in Room 1 in the new house; dining room furniture will be numbered 2 and placed accordingly. With this method each article will "arrive" in the right room and will therefore only need arranging. If the numbers are pasted on

Household Management

Head Work to Save Steps

use a flour paste so that the paper can be easily removed from the woodwork by using hot water. MRS. G. O. VOLOVIC.

New York.

Saving in Time.

Many women waste hours in churning; in Summer the temperature is too high and Winter too low for the cream. We have learned to avoid this waste of time by using a dairy thermometer and thus have the cream just the right temperature before operating the churn.

When making lye hominy we always use the washboard for rubbing the black end off the corn, but having a brass board this year we used the horseradish grater and found the work was accomplished in less time. A food chopper will grind a pint of horseradish in a fraction of the time it takes to do this work with the grater.

When time is lost in hunting the work gloves sew a brass ring in the wrist and hang on a hook when not in use.

A cup of kerosene in a pail of hot soapsuds will save time when washing windows, walls or floors. Dirty overalls, wristbands and other articles that require extra rubbing can be quickly cleaned with a five-cent vegetable brush. The brush is also a time saver in washing all kinds of vegetables and dairy utensils. When getting a meal put a pan of hot soapsuds in a convenient place and wash every utensil when used.

It often saves time to make the pie crust the day before using and when chilled it is even better. Baking powder biscuits can also be chilled.

Dustless dust cloths and mops save much time as no dust is scattered. They can be made at home by soaking a flannel cloth in paraffin oil over night, then hang out to dry. These can be washed many times in hot soap suds without fresh oil. Equal parts of coal oil and turpentine also make good dustless dusters.

To save time on washday without injuring the clothes the following recipe needs only a trial to convince even the most skeptical. One ounce of powdered ammonia, one ounce of powdered borax, one ounce of salts of tartar, one pound of potash to one gallon of water. Place in a jug and use one half cupful to nine gallons of water for white clothes, boil 20 minutes, rinse well and only badly soiled articles will need rubbing. After white clothes boil towels, etc. This water will not fade the colored clothes. Neither will it injure any fabric or the hands. The ounce of powdered borax is often omitted as the other ingredients are sufficient for the purpose. M. C. B.

SOUND MANAGEMENT IN THE SCHOOLROOM.

THE BATHROOM IN THE FARMHOUSE.—If it is impossible for you to have a modern bathroom in your farmhouse at present, then do the next best thing. Just set aside a room wherein each one in the house can wash the entire body at least once a week. If you can't get water piped into it perhaps you can get drainage for water out of it. When necessary you can do without either, but a tub you must have. An enameled tub new or secondhand is best, but tin will do or even a wash tub. Be sure to have a stove in the bathroom. If the room is small perhaps an oil stove will do. With a warm room and plenty of water the bath will become a pleasure. It is well to have the bathroom as near the kitchen as possible, so as to be close to the hot water. It can then be used for the hand washing room so necessary to men on the farm. The walls may be painted or enameled some desirable color, and table oil cloth placed where the splatter comes.

Nebraska. MRS. A. B. WALKER.

CHEAP KINDLING.—We have solved the kindling question by putting into operation a plan which at once includes economy and tidiness; it is by making burnt match sticks kindle our fires. We use a number of matches, for various things, and while keeping them off the floor, out of the waste basket and places where they might otherwise kindle an unwelcome fire, we accumulate them and make a proper use of them. Underneath or beside each match safe in the house we have a tin receptacle into which the burnt match, after we have taken the precaution of seeing that the fire is extinct, is placed. About once a week some one makes the rounds and empties each tin box; the match sticks being placed in a paper bag and tied with string. This bag of kindling is then put into a larger tin box for safe keeping. In making a fire progress is enhanced by having one or two of these bags of match sticks as a starter. A. P. W.

Farm Women's Problems.

ONE of the problems of a farmer's wife is to find the time to do many things she would be glad to. Truly I cannot think of any special problems we have. I was brought up in a small village, in Vermont, then lived for five years in a small city, then for three years in Boston, where I found the other half, a city man born and bred. We left the city 19 years ago for the farm up here in the Vermont mountains, and I have never regretted coming. We have both poor health, had when we left there, but so much better than we would have been in the city. A farm is the place to bring up boys. We have had many losses, but none of our family. So our greatest problem is how to escape such losses, when they come so suddenly there is no escape. Truly I think the same problems confront village and city women, even harder than farmers. Giving health, wisdom to do the right thing at the right time, and our fair share of the ever needful (which THE R. N.-Y. is trying to get for us) and in my own private opinion there is no place like a farm. We are near a village, good library, schools (there is my greatest problem; I wish the schools were different, but as they suit the rest I suppose my say would have little weight) telephones, auto's, all the "city comforts" in fact why should we complain? MRS. W. H. L.

Vermont.

"WHAT in my judgment do the farm women in our neighborhood most need?" I should say first, and foremost they should read more, or take more of the leading women's magazines, or THE R. N.-Y., all of which give in recipes, ways and means of cooking and serving everyday foods and their values, which so many women do not know how to cook and serve in a palatable way. All around us here, some have hot biscuits, coffee ham or bacon and pies every day through the Summer, hardly ever have much of a garden, because the men haven't the time to make garden as it should be, as it takes constant work, which is too much on women. By far the most important means to get farmers' wives out of the old rut is to make the men over entirely, so they may see women's needs in the way of conveniences, in kitchen, bathroom, running water in house and washhouse, etc. Then again "Uncle Sam" might do well sending, or having a teacher, where needed in neighborhood, teaching farmers' wives how to make good bread and cooking the proper foods which must nourish the women, children and men. Lots and lots of them do not know how to make bread, and buy baker's bread, not knowing of its little food value. I have asked many of them why not make their own whole-wheat bread: they would say "Oh, I can't make bread." If they only knew that in eating or having their families eat whole-wheat bread every day, there would be less doctor's bills! By far what is most needed is that they read more, many of them not having a single magazine or paper coming into the home.

Missouri. MRS. K.

SEVERAL things come up to perplex us here, and the most alarming thing seems to be the scarcity, of domestic help. My idea of this is that the complicated ways of living will have to be simplified and that if a crusade is made against this and we can be helped to systematize and simplify our housekeeping operations, one great step has been made. We, as a class, do not understand food values, nor do we practice sanitation as thoroughly as we should. We do not give enough attention to ventilation, particularly in bedrooms during cold weather. Personally, domestic help and food values are my troublesome questions. We live on a large farm and I have three and four men to cook for, making a family of five or six; a large house to care for and am not very strong. I put out washing and ironing, buy bread and yet can't do it alone more than half the time. Help at $5 per week seems a luxury not desired. I know there should be some more satisfactory way. If there were a crusade against this complex system of housekeeping it seems to me it would be of general benefit to the great army of farm women. MRS. B. L. C.

Ohio.

That Pantry of Mandy's

(Continued from page 1155)

Mandy flopped off so sudden, but it's that everlasting carpet; funny thing how a woman, once she gets carpet on the brain, can't seem to think of nothing else until it's home and tacked down."

As Mandy changed her dress her mind was one wild jumble.

"Tacks!" she cried. "I don't know where they are, and I don't want to know."

It was some time before she came down, but they were at the barn doing chores so she set about getting supper. Her mind was as busy as her hands, and once she almost smiled. One thing was certain; she wasn't going to give up a dream of years without a struggle.

"How do you like yer pantry, Mandy?" asked Ephraim later, as he sat down to a steaming supper. "I sort of finished it for you today."

"I see you did," said Mandy calmly and Ephraim never noticed.

The next day Ephraim had to take a load of hay to Chateaugay, and it would be mid-afternoon before they were back. Lant was going with his father. Mandy hurried the younger boy off to school, waited impatiently until the load of hay went down the road, then she fairly flew at the pantry.

In the depths of her soul she longed for an ax, but she knew she would do more effective work with the despised hammer. She began by carrying back to the old house all the old truck that had been piled on the shelves. The top shelf was the worst of course; it was hard to reach and Ephraim had put the knives of his mowing machine up there so that they would not rust. Every little while she would stop and pull a paper clipping out from the pile of tools and lay it carefully aside. She longed to lift the lid of the stove and tuck them all in but she knew she might as well burn the insurance papers. In every case they were farm paper clippings. When the last harness buckle was out she began on the shelves and long before the last nail was pulled, Mandy was almost too tired to stand. It was after two o'clock when the job was done. Her pretty new paper was ruined and the wall was jabbed full of holes, but there was a look of grim satisfaction on Mandy's face as she cleared things up.

At half past three she saw them coming down the road, and as they came up the driveway she saw Billy's check rein swinging again, and an amused smile lighted up her tired face.

"Guess Ephraim's tacks didn't hold," she mused.

Leaving Lant to unharness the team, Ephraim yanked off Billy's bridle and started for the house. Mandy saw him coming and knew just what he would say when he came in. She also knew just what her answer would be. Taking up the last magazine she was apparently deep in it when Ephraim suddenly opened the door.

"Gimme the hammer and a couple of rivets, Mandy, and I'll fix this check rein so's it 'll stay this time."

"You'll find them out in the old pantry—in the old house, Ephraim—that's where they belong and where they stay hereafter."

Ephraim stared at her a moment and then marched to the new pantry door and looked in. His shelves were gone and all the truck which he had so carefully laid away had disappeared.

"Why Mandy—where's the pantry?"

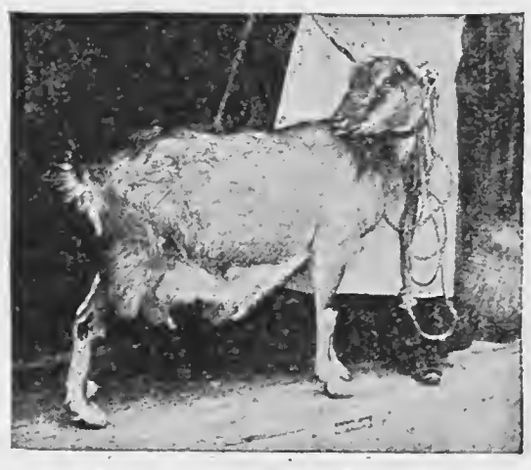
"It's right there where I want it. It belongs to me, or ought to. I've struck for my own pantry—to have it just as I want it. That's my right the same as you have the barn to suit you. If you bring that stuff in here again I'll just take it right out again!"

Mandy wasn't angry, it was just cold, justified assertion of a household right, and as Ephraim looked at her he saw Mandy at last meant business. Ephraim was at heart a just man and he knew Mandy. He stood holding the bridle in his hand.

"Why, Mandy, I didn't know you was so set on havin' things your own way! That ain't no way to have a pantry fixed up, but if it suits you—well let it go for now."

Producing Goat's Milk.

A USEFUL farm lady is shown in the picture. This is the milch goat, Jennie, belonging to Mrs. C. B. Dreyer. This goat is four years old and gave three quarts of milk a day when fresh. This milk analyzed 5.8% fat, and 9.6% solids not fat, and total solids 15.46. Jennie gave two quarts a day, four months after she was fresh. She is not a purebred goat, but what we would call among cows a grade, probably a mixture of several of the definite pure breeds, but she is a good one and above the average as a milch goat. It is evident that great interest is being taken in goat breeding. Several of our women readers have started good flocks and are doing a fair business in selling the milk. It has a fair sale as food for invalids, and where its qualities are known, it commands a high price. In almost any city or town the better class of physicians would prescribe goats' milk for certain diseases, if they were sure of obtaining a stated supply. The



"JENNIE" THE MILCH GOAT.

business seems to offer a fair opportunity for some farm women to establish a good business, but it would not pay to breed goats except in places where a constant demand for the milk can be created, but there is unquestionably a good call for milch goats of fair quality. Every year we have 50 or more letters from our people who want to buy such a goat, and it is almost impossible to find good animals for them. A business of this kind would seem to be especially adapted to farm women who have made a success of raising sheep or calves.

Canning Pork and Beef.

WHILE in attendance at the Ohio State Fair at Columbus last week my husband subscribed for your paper. On looking over our sample copy almost the first article I read was H. A. E.'s question about canning meat. Now I am very proud of my success in the canning of both pork and beef. I can the strip of tender loin which is found down both sides of backbone as well as hams, shoulder and sides. Cut in slices convenient to pack in cans, salt and pepper as for immediate table use. Having cans sterilized and tested to know that lids are all right I begin packing into glass quart cans, using a round ended stick—I use the top sawed from an old broom handle—to pack the pieces in as tightly as possible. I always use small bits to fill in the chinks. When I have eight or 10 cans filled I put *old* rubbers on and place lids on cans so they will hold, but not real tight, put a board in bottom of washboiler, place cans on that and then fill with cold water until almost up to ring or top. Place on stove and from the time water begins to boil I keep at the boiling point one hour for pork and two hours for beef. The age of the beef may call for a half hour longer. When the time is up, draw boiler to back of stove, with a cloth remove cans from water. This is the only unpleasant part to me, for the cans are very hot. Take off tops, remove old rubbers, replace with new and tighten lids as one would for anything else to be kept airtght. This will keep until used; one year or two. The juices are all retained in a jelly-like form around the meat.

The pork I have always prepared for the table by browning in butter or lard, then making a milk gravy to which one must add the jelly-like juice. This is certainly an excellent meat dish. The beef can be used in the same way, substituting water for milk, or more water may be added and a stew with dumplings or biscuit prepared. One reason this way of canning beef appeals to the housewife is that no matter how old the animal is if boiled sufficiently it comes out as tender as that of a yearling, and in fact from experience I believe the older the animal the better the jelly-like juice will be. be.

So to H. A. E.'s questions I would say fresh pork can be canned. It is better boiled directly in the cans, no water touching it, glass cans to be used. It will keep through warm weather in a cool cellar. I want to add that the juices from the meat will not fill the can, but that does not matter; the meat not covered will be just as good as that at the bottom of can. As butchering season approaches I do hope this will be of benefit to many housewives as it has been to me. KATH. C. WIVEL.

Ohio.

Pack sausage seasoned as for the table, tight in tin cans, then put cans without lids in a bread pan in the oven, so the grease will not run out on the oven floor. Cook three to four hours, or until a brown skim comes on the top of the gravy in the can. Take out, be sure to wipe all the grease off the top of the can, put on the lids and seal. On opening, cut the bottom of the can out, and your sausage will come out in a nice roll ready for use. The fat around it is fine for frying and the jelly makes nice seasoning for an omelet. MRS. E. C. K.

Take lean meat for canning, leaving a small portion of fat on some of the meat, and cut into pieces just small enough to go in a quart glass jar. First put one teaspoonful of salt and a little pepper in the bottom of the jar, then put in the meat, pressing it down until the jar is full. Do *not* add any water, lard, or stock, for the meat itself makes stock in jar while cooking. Now put on the covers, but do not screw tightly, then put the jars in a boiler with warm water enough to come half way up the jars. Let it come to a boil and boil for about two hours. Take out jars, screw the covers down tight, put back into the boiler and completely cover them with hot, or better, boiling water, and boil two hours longer. Take boiler from stove, letting jars remain in water until cool enough to handle. Take out and see that the tops are all tight. When cold put away in a cool cellar and the meat will keep indefinitely. This process has been used in my family for 20 years, and has always been found to be perfectly satisfactory and a great convenience when unexpected guests arrive.

THE Monitor CALORIC

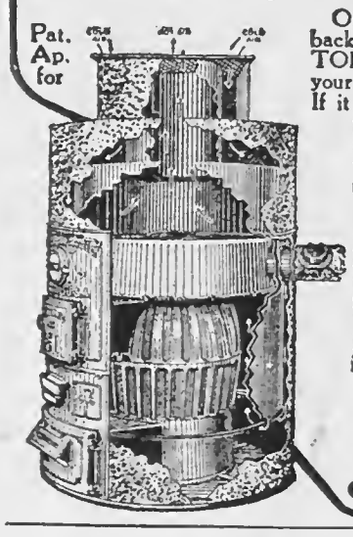
"The Furnace Without Pipes"

The most unique heating system ever introduced. Requires neither flues nor pipes in the walls or cellar. Distributes heat perfectly through one register, necessitating but one hole in the floor. Brings city comfort right into the farm home. Costs less than other furnaces and can be easily installed by yourself.

Absolutely Guaranteed

To save at least 25 per cent. of fuel. Burns coal, coke and wood equally well. Does away with the disagreeable task of carrying coal upstairs and ashes downstairs. Gives you more space in the living rooms by getting rid of the stoves. Keeps the upstairs rooms and halls uniformly heated at all times.

30 Days' Trial



Our guarantee stands back of every "MONITOR." Install one in your home for 30 days. If it does not give complete satisfaction in every respect we will refund your money.

Free Booklet

Describes and illustrates all important features of the "MONITOR." Be sure to write for it AT ONCE.

Indian Bead Work

NOTHING is more fascinating or more in vogue at this time than **Indian Bead Work articles.** We have procured an outfit for making these articles, which will be sent, delivery charges prepaid, for

ONE NEW YEARLY SUBSCRIPTION
OR
THREE YEARLY RENEWAL SUBSCRIPTIONS
(One of these may be the renewal of your own subscription for one year.)

This outfit consists of a Patented Loom for making articles, an instruction and design book, a spool of cotton, twelve H. Milward Sons' needles, seven bottles of colored beads—dark blue, green, light blue, black, red, yellow and white—a complete outfit to start the work.

Every woman knows and appreciates the value of these home-made articles.

Your neighbor needs *The Rural New-Yorker.* If he is not a reader get his subscription. If he is a subscriber get his renewal.

These articles will not be given with subscriptions—they are sent as rewards only (in place of cash) to our subscribers and friends who, acting as agents, send us subscriptions as indicated.

THE RURAL NEW-YORKER, 333 W. 30th St., NEW YORK CITY

A Boy Wanted.

HERE is another problem which appeals to many country people. Possibly some reader can help solve it.

For the last three years we have been reading about the redheads. I suppose you have none to spare. We haven't any —i.e., boys. Providence has sent us two girls, but we cannot look forward to their being farmers when the wife and I are too old to continue active farm work. We dislike to consider the possibility of being compelled to sell the farm and move to town. I wonder if any of THE R. N.-Y. readers know a redhead or a towhead who needs a good comfortable home? We are not rich, but we have a good farm, make a fair living and hope to educate our children and that includes the boy. G. B. P.

Pennsylvania.

A Bunch of Suggestions.

THE old theory that baking powder mixtures must be baked at once has been abolished. A cake may be mixed, put into the pan and put into a cold place, if it is not convenient to bake it immediately. The action of baking powder is not immediate and very slight in a cold place.

Bayberry candles are quite difficult to make. Still one loves the odor of bayberries. Here is something new and easy to make of bayberries. Put the berries in a flat little bag and use these bags in place of ironing wax. The scent when the iron passes over this little bag is very pleasing.

Lettuce which has been pulled by the roots may be kept fresh a long time by placing the roots in water.

A CONTRIBUTOR.

Lost: Ten Minutes.

CUSTOMER: "Milk five cents a pint and 10 cents a quart! How outrageous! You country people must all be rolling in money. Isn't there any limit?"

Dairyman (apologetically): "Well, our milk is clean. We hire high-priced help and try to handle it right. Then our feed is higher than it was last year. Pastures are dry, and the price of everything is high."

Customer: "Indeed! Now what I say is, why don't you farmers raise your feed and not all the time complain of high prices?"

Dairyman: "We have to let the mill man make the bran, madam, and the other mill feeds, while cottonseed don't grow in Kentucky, so we can't make the meal."

Customer (very knowingly): "Yes, but there's substitutes and all the papers say there are bumper crops. So why do you feel obliged to charge *me* 10 cents a quart for the same milk I can't see."

Dairyman: "The bumper crop report, Mrs. Smith, is to induce the farmer to sell cheap. The fact is there's very little hay in the country. And we barely make expenses."

Customer: "Oh, the same old story. All I say is, and I say it again, you ought to raise your own feed and your expenses wouldn't be so much."

Dairyman: "If we do raise it ourselves, Madam, it is worth the market price just the same. May I have the week's collection of bottles? I am half an hour behind now?"

IDA EARLE FOWLER.

Unfermented Grape Juice.

WITHIN the past few years the use of unfermented grape juice has increased to a great extent, and it is probable that since Secretary Bryan has set the seal of his approval upon the use of it, it will be even more popular. It is invaluable in the case of fevers, and is considered by physicians to be one of the best of tonics, especially in cases of nervous prostration and after surgical operations or a debilitated condition of the system, especially for anæmic children. I often put a small bottle in my little daughter's lunch pail, and it always pleases. I have had so many requests from strangers as well as my friends, for my recipe, that I wondered if the Rural sisters would be interested in my way of making it. If you want a clear, bright crimson juice, use the grapes before they are fully ripe, grapes that are entirely ripe will give a purple color and a different flavor. I like a mixture of purple and white grapes, not too ripe, this gives a good color and a fine flavor. Pick the grapes from the stems, being careful not to use any green ones, wash, and place in an aluminum or porcelain lined kettle, cover with boiling water and cook until soft, so the seeds will separate readily from the pulp, mash with a wire potato masher, and place in a jelly bag to drain. Do not squeeze the juice out, but hang on a nail to drain. If you wish to get as much as possible from your fruit, after most of the juice has drained from the pulp, it can be put through a sieve, and the seeds and skins removed from the pulp, sugar can then be added, and all cooked until thick, and this makes an excellent marmalade. Place the clear juice in a clean aluminum or porcelain lined kettle, add about a cupful of sugar to each quart of juice, some tastes like it sweeter than others, and if the grapes are very ripe it will require less sugar than when they first ripen. Bring quickly to the boiling point, skim, and put immediately in sterilized cans, being careful to fill the can slowly at first and shake the hot juice up onto the sides of the can, as the cans break much more readily than with canned fruit. Seal quickly and you will seldom have a can work or mold. I usually fill all the bottles I can get, to give away, as a bottle of grape juice seems to be appreciated more than almost anything I can give to a sick friend. I have the bottles clean, dry and hot when I fill them, though I never feel quite as certain of their keeping perfectly as I do that put in cans, though I use new corks and push the cork as far as possible into the neck of the bottle, then cover with paraffin or sealing wax.

Michigan. CLAUDIA BETTS.

DOWN in a Southern mission school was a young Northern teacher who was over-anxious for her share of what good things there were. "A little of the escalloped potato, I *like* the brown top, please," she would say. "It is strange how the brown part of her helping always slid off the spoon," remarked the principal in speaking of the incident.

POISON IVY AND ANTS.—W. B. W. inquires how to rid a place of poison ivy. I succeeded in clearing a badly infested place by allowing cows to graze where it grew. The cows seemed to relish it and no bad results were noted. If R. D. U. will sprinkle tartar emetic mixed with sugar wherever ants congregate, whether indors or out, it will surely eradicate them. In some cases it may be well to add sweetened water in dishes, placed on shelves in pantries, but I prefer the dry method. In either case it is a certain remedy for the pests. It must and roses and clove pinks. The sun is shining and the birds are singing, and every day for a whole week I've been well enough to get outdoors to sit on the lawn seat near the back door. For several weeks I haven't had strength enough to. S.

PAINTING BLINDS.—Father has been painting blinds, a job he has not attempted for 40 years. The first one took him 55 minutes, and he said it made his back ache to stoop so many times to dip his paint brush into the pail on the ground. I suggested a board across the horses where he put the blind. The second blind he did in half an hour. S.

COOK BOOKS.—That bit about cooking recipes in paper was very good. Do you know a single woman who ever uses the average recipe in the average paper? I don't, although we have used a number from THE R. N.-Y. The best and most practical cook book for the country home that I ever saw is one that cost a quarter and was got out by the ladies of a little church in this State. It is just the daily recipes they use, and the things they need to know, with a few dainty desserts added by the minister's wife. A college woman, who is companion housekeeper in an exclusive Summer resort took that book with her as the only one she would need. K.

DESTROYING MICE.—Regarding the cat and mouse article on page 927, would say a mound of concentrated lye placed in a shallow dish, such as a tea saucer, hollowed out at the top and a little molasses in the hollow is a good rat and mouse trap. They get enough lye in eating the molasses to kill them. Care must be taken that cats and chickens do not have access to it. To purify stale cistern water tie a pail to a rope, till it with water and churn or plunge it up and down in the cistern for a few minutes. H. H.

Michigan.

:: "Short Stories" ::

WE WANT

A great many things. Some of them may have to wait for slow growth, but not all. Here are two of these things which we expect to have on time:

A Good Thanksgiving Story!
A Fine Christmas Story!

Do not spend time tracing out nice distinctions between "good" and "fine." We want the best stories possible. One is to be printed in our Thanksgiving number—the other at Christmas. We want stories of farm life—the best of farm life—and we prefer to have them written by farm people. We will pay a fair price for a suitable story.

Do Not Make It Long

It should be from 1,000 to 2,500 words, boiled down, suggestive, strong and true to life. The Thanksgiving story should be here by November 1 anyway. The invitation is to all, but we should prefer to have the story right out of the heart of some farm woman to whom life has given, through experience, the true Thanksgiving and Christmas spirit. Of course we cannot agree to use all the stories which may be sent us. Those not found suitable will be promptly returned. Now, let the story writers put on their thinking caps and see what they can do.

THE INVALID.—My neighbor's oatfield is full of wild mustard, and it irritates me to see it there. Yet I can look above it to the blue sky, or beyond it to the pine grove, or at the roses in our garden. Out of doors is sweet now with pine odor be remembered this is poisonous, and must be placed out of reach of children. Five cents worth cleared my house of them in one season, and they were very numerous. R. H. S.

Connecticut.

SWEEPING COMPOUND.—My grandmother used to save all her tea-leaves from one sweeping day to the next and then wet them, and either pressed out superfluous water or else allowed them to drain for a few moments in a strainer. She then sprinkled them over the carpets to be swept and they certainly made the carpet look a great deal brighter as well as prevented a great deal of dust rising in the air to settle on the furniture, which necessitated more work in dusting. F. B. T.

AUTOGRAPH ADDRESS BOOK.—Something new has come to me recently, an autograph address book. It is something on the line of the old autograph album, but has several spaces on its daintily decorated pages, and you write your name so it will give your correct address, as Miss Mary Strong, 341 Essex street, Boston. There is an attractive verse on the cover. S.

"THE MISERABLE COCKROACH."—Some years ago our house became infested with them to such an extent we almost had to leave. I asked an old storekeeper if he knew a remedy. He said he surely did; that they had them in their store once, and after trying many things tried scattering borax about their shelves and on floor or wherever they went, and they left. We used it; they went for us also and at once. The remedy is clean, sanitary and will harm nothing. W. W., JR.

ABOUT BANANAS.—Strawberries and bananas are good together. Try them for a shortcake early or late in the season, when strawberries are scarce. Crush the berries and slice the bananas thin. A farmer my uncle knows buys bananas by the bunch, and always keeps a bunch hanging where he and the hired men can get at it. The men like fruit as a lunch between meals, and the farmer says this is the cheapest thing he can furnish. A health expert says that anybody can eat bananas if the fruit is sliced very thin or eaten slowly. S.

A USEFUL MINISTER.—Have you seen an item that was in the "Boston Globe" a couple of weeks ago about the Connecticut minister who was making himself so useful in his district, and being upheld by his bishop? The minister even cuts the boys' hair in the vestry after church, he takes the farmers' supplies to market, and brings back what they want. My sister has seen his church, she taught a few miles from there at one time. The church is a tiny place at a cross road, three-quarters of a mile from any house, and seven or eight from village or railroad. E. S.

SANITARY FLOORS.—I beg of every woman to clear the floor of her dining room and have her husband or some one to paint it (preferably a light color), perhaps give it two coats of paint if it is an old ugly floor. When the paint is dry use a coat of marnot; this not only gives a beautiful gloss but makes a hard surface, which will not show heel prints, etc. A few small rugs or pretty pieces of carpet put down where the most walking is done, will make the cleaning easier. Gather up the rugs and take the dirt out with them, then put an onting flannel cover, partly saturated with kerosene on your broom, and go over the floor; it will look as clean and pretty as a polished table. Of course houses are built with the expectation of bare floors now-a-days, carpets are so unsanitary. Modern floors need only a coat of varnish, but do have bare floors in Summer if you have to fill and paint old floors to get them. CORA JUNE SHEPPARD.

SHUT CELLAR WINDOW.—I am often surprised to see the cellar windows of country houses standing wide open in mid-summer, though I can remember that for years I did not know any better myself. From the first of April I never open my cellar windows unless the temperature outside is, say five degrees lower than that indicated by my cellar thermometer, and I am exceedingly careful not to leave the windows open after the temperature rises outside. The result of this is a dry cellar, and at no time up to now has the temperature been above 60 degrees, while on Tuesday morning, before I closed the windows, it was 55 degrees. We keep our milk, butter, meat, etc., in a safe, and have had no use for ice up to 90 degrees or above, we think 65 degrees very cool, and milk brought from the cellar is very refreshing and probably more healthful than when iced. The warm air entering a cellar when the windows are open causes the dampness, so general in house cellars, and very little attention to opening and closing the windows will prevent this. I feel that many housekepers would be glad to know this, hence this letter. A. C. WORTH.

A MAN in New York went fishing on one of the Brooklyn piers, his little daughter, four years old, went along with him, on condition that he would look out for her. The man became so interested in his fishing that he forgot his child, and she fell off the pier and was drowned.

THIS question of taking a "dare" has serious consequences. In England recently a rich young man was challenged by his companion to jump off a boat into the river. He jumped to his death. A New York girl recently swam across the Hudson River. A 15-year-old boy was dared to equal her record. He plunged into the river, started the mile trip, became exhausted, and was drowned. There are too many people in this country who are afraid to get left. There is a good old saying, "Dare to be left, where to be left is right."

:: Heating the Farmhouse ::

The Hot Air Furnace

[Note—Hot water and steam for house heating will be considered later]

No. 1.

CONDITIONS INVOLVED.—Our farmhouse was probably built nearly, or quite, one hundred years ago. The walls are of plank placed vertically from sills to plate and clapboarded on the outside, without sheathing or paper, and lathed and plastered on the inside. Like many old houses, the ceilings are low, only a little over seven feet in height, but the rooms are large, and after one loses his fear of bumping his head seem homelike and cosy. For seven Winters we have tried to keep the house comfortable by using two heating stoves, and a range in the kitchen but, as a matter of fact, we have lived in about three rooms and abandoned the rest to Jack Frost for a season. This required the use of eight tons of hard coal, and we decided that before the eighth Winter came upon us we would install a furnace and have the use of the whole house, Winter and Summer alike. The cellar was dug only under the "upright," but was deep and commodious, and we could use either hot air, hot water or steam, the choice being left to our fancy and pocketbook. All three systems were considered and neighbors who had the various kinds were interviewed as to their efficiency and economy. We quickly learned that those who had hot water were very sure that hot water was the only system and that those who had steam wouldn't think of using anything else. Those who used hot air furnaces couldn't be persuaded to exchange them for any other kind. Such is the pride of ownership. It was evident that all three are eminently satisfactory and that the choice must be made on other grounds than efficiency.

REQUIREMENTS.—Our house is surrounded by large maples which, while furnishing delightful shade, tend to keep the rooms damp, and we find it necessary to have some artificial heat in the house early in September and to continue it late into the Spring. But we don't want much heat for at least three months of the year; just enough to take the dampness and chill out of the air, any more is wasted. We found that our neighbors with modern steam-heating plants were forced to burn enough coal to generate steam if they had any heat at all; that this required considerable fuel; and that they were frequently compelled to open their doors to get rid of the surplus heat. That seemed wasteful. Those who had hot-water fared better during the chilly months; they could get a circulation of moderately hot water with but little fuel; no need to boil the water to obtain heat. But a hot water system was expensive; the most expensive of the three. If the heat from a few chunks of burning wood could be utilized it would be all that was required on many days of the year. These few chunks of wood would not raise steam in a boiler, however, and it is doubtful whether they would start a circulation of hot water. But in a hot air furnace they would accomplish their mission; air is easily warmed and made to flow through pipes to the place where it is needed, and more than this, wood is a product of the farm, its use as fuel is economy. Still further, a hot air furnace can be installed at practically half the cost of hot water or steam. These things being considered, the choice fell upon hot air.

EXPENSE OF HOT AIR.—The good fortune of having a relative in a business with hardware connections enabled us to obtain our furnace and fittings at trade prices. A high-grade furnace of ample capacity cost us but $65, a little more than the cost of an equally high-grade stove. As the large sitting room had a cold bay window in which house plants are kept we purchased a hot-water radiator also, and placed it next to this window and connected it with a water coil in the furnace. This cost about $15 extra, inclusive of an unnecessarily expensive expansion tank and water gauge.

HOW INSTALLED.—The minimizing of expenses being a necessity on this, as on most farms, led the owner to attempt the installation of the furnace practically alone. After all, a furnace is nothing but a big stove enclosed in a jacket and connected to the rooms to be heated by means of tin pipes. It was decided that five hot-air pipes, one being large enough to heat two bedrooms, would be sufficient. The furnace could be placed so that they would all be very short and with a good pitch throughout their length. Three were nine inches in diameter and two 12 inches, one of these latter going to the big sitting room and the other by means of a Y connection being made to heat two bedrooms. From the cold northwest corner of the big parlor a wooden cold air shaft, made of matched flooring, was carried to the cellar bottom and here connected with the concrete conduit leading to the concrete pit beneath the furnace. A sand bed behind the barn furnished the material for this concrete work and the muscle of the owner the labor. If a few general principles of concrete work are understood, it can be well done by any husky man.

INSIDE "THE LITTLE RED SCHOOLHOUSE."

POINTS FROM EXPERIENCE.—Every farmer must be at least an amateur carpenter; he should be also something of a mason and it would be well if he were handy with the tinsmith's tools. The proprietor of this farm dabbles in all trades but the tinsmith's. He hasn't learned to use the soldering iron. But the furnace was set up, the registers put in place, and the concrete work done before the local tinsmith was called in to connect the register boxes with the furnace jacket and the radiator with the water coil; many farmers would have done this equally well and much quicker than the local "expert" did. Professional plumbers have a way of keeping very busy and accomplishing very little when it suits them to do so. The eight-inch smoke-pipe had to be carried up through two floors to a short chimney in an upstairs bedroom. This pipe is made of the best quality Russian iron and a liberal use was made of asbestos sheathing wherever it came near the old pine in floors and joists. Asbestos is cheap, but it would cost considerable to replace the old house. The hot-air pipes are also well covered with asbestos, and hot-water pipes will be wound with old burlap sacks. All pipes were made as short, and given as much pitch as possible; hot air likes to go straight up. The cold air will be taken from the house instead from out of doors; this helps the hot air from the furnace to enter the rooms and saves heating the icy outdoor blasts in zero weather. Well; the job is done in first class shape and required a money outlay of practically $150. If you know of anyone who wants to buy two heating stoves, we have them for sale; and we kind o' wish that Winter would come. M. B. D.

The School Lunch.

The subject of school lunches is always one of interest to the mother whose children are obliged to take a cold luncheon, and she cannot give the subject too much attention, for the child's health depends very largely upon what the lunch box contains. It must not only be nourishing, but it must be tempting in appearance. Nothing adds more to the daintiness of the lunch than to have the sandwiches, cake, etc., wrapped separately in paraffin or parchment paper; this costs but a trifle, as do paper napkins also, and they are certainly worth all they cost as the food is kept moist and looks so much more appetizing, a fact that is of no small importance to the average child. Of course, the sandwich is the main part of every lunch, and there is no end to the variety of these. The bread must be sliced thinly and evenly; if meat is used it is more appetizing if run through the food chopper and for a variety a bit of mustard or cayenne is sometimes added. Sardines minced fine are good, also hard boiled eggs, mashed fine, and melted butter, salt and bit of mustard or cayenne added, and sometimes nasturtium or celery leaves chopped fine. If a cottage cheese is liked, that makes a good filling—most children like peanut butter, and as it costs only a little more than half the price of cream butter, it is really more economical. Cold chicken is always good, also slices of beef loaf with plain bread and butter.

Little individual pies are much more appetizing and also easier to keep from becoming mussy than an ordinary piece. Little cakes iced with plain icing, then a little chocolate or cocoa added to a bit of the remainder and placed on the cake to form a "brownie" face always delight the little ones, and sometimes even the older ones, as well. A little surprise usually goes a long way with children and I usually keep some dates, figs, etc., for this purpose and a few are added occasionally, also a little pure candy; if homemade, all the better. Nuts are now considered a valuable food, and a few added to the lunch box are a most wholesome addition; the children can pick them out and they can be kept for this purpose.

A large-mouthed bottle with a screw top, such as vaseline or cold cream is sold in, is nice in which to send canned fruit, custard, etc. Fruit should always accompany the school lunch, and occasionally a banana or some fruit not quite as common to the country child, as an apple is appreciated. CLAUDIA BETTS.

We Save You $8

Fall Suits and Overcoats

$10 to $22

Money Refunded If Not Satisfied

Of course you want that new Fall Suit or Overcoat of yours to be stylish. Yet the more dollars you can save on such a garment the better you will like it. Let's get together.

Send for our Men's Fall Style Book and 40 samples of cloth patterns. You select the style of cut and cloth sample which you like best. Write your measurements in order-blank which we furnish. You can't go wrong. You can't lose on the Glen Rock plan.

Every garment is guaranteed not only to fit perfectly, but to *keep* its perfect shape permanently. Glen Rock garments are noted for the excellence of cloth, trimmings, cutting and tailoring. Signed guarantee attached to every made-to-order garment. The first step to save $8.00 is to **Send Today for Style Book and 40 Cloth Samples. IT'S FREE.**

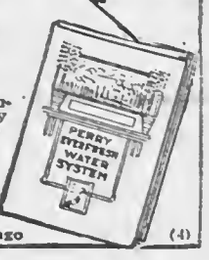
WONDERFUL FAUCET CONTROL

EVER-FRESH WATER SYSTEM for FARMS AND COUNTRY HOMES

Here at last is the perfect water system for farm and country homes—one that gives you all the pure running water you want fresh from the well just by turning a faucet anywhere about the house, barn or yard. No stale, stored water—no slimy tanks to clean and repair. No pump to freeze—no depending on wind or weather.

Over 6 Years Old — **Everfresh WATER SYSTEM** — **Over 6000 Sold**

is controlled entirely by the turning of the water faucets. Opening any faucet in house, barn or yard starts the Perry Pump and delivers a full steady flow of pure cool water at well temperature the year round. Closing the faucet stops the pump and it will remain idle until you again open a faucet. No waste, no bother—no stored water. One system will supply water hard or soft, hot or cold, for family, kitchen, laundry, toilet, bath and barn use. Easy to install, inexpensive to operate. No change in well or location of buildings required. Write for free catalog today.



UNITED PUMP AND POWER CO., 473 Dickey Bldg., Chicago (4)

Live Stock and Dairy

THE HOTHOUSE LAMB.

IT is time now to begin to have a talk about the hothouse lamb. Those who know how to produce this expensive morsel of food have a good business which prospers from year to year. The picture shown on this page was sent us by J. J. Ross & Sons, of Delaware. The little lambs shown in the picture were handfed, the smaller one being the smallest of triplets, and the other being deserted by its mother. The grandchildren of the senior Mr. Ross took delight in feeding these little lambs, and they prospered abundantly at the business. Delaware is making a good record at the lamb business. The mild weather, and the abundance of cheap fodder, give a good opportunity for those who know how. It has often been suggested that this raising of hothouse lambs would prove a good business for women, and a small flock of ewes properly handled would give a nice income, with probably a more agreeable work than that of running a dairy herd. The objection which we have had urged

LAMB BROUGHT UP BY HAND.

against lamb-raising for women, is the fact that whoever raises these little creatures gets to love them so that it is almost like breaking home ties to see the fat little creatures finally go to the slaughter. It is quite a problem sometimes to advise women as to the best kind of stock for them to raise in case they take up stock breeding in any way. Most of them appear to take poultry of some favorite breed as best suited to their capacity. Several women that we know have done very well with pigs, and we have a number of readers who tell us that their milch goats are quite satisfactory as money makers. Several of our women readers, however, are actually raising lambs for sale, and we would like to hear from them regarding the profit in their enterprise.

LIVE STOCK IN EAST TENNESSEE.

THE country adjacent to the line of railroad from Knoxville to Chattanooga is specially adapted to dairy farming, and has for years been the best dairy section of the South. Upper Eastern Tennessee is coming to the front along dairy lines rapidly. The milk within hauling distance of railroad has been shipped to Knoxville and Chattanooga and then retailed and made into ice cream. Nearly every village and hamlet along our railroad has a knitting mill or woolen mill, and many of them two or more, hence the ice cream trade is something immense, and we have a good market for all our milk or cream. It is all sold by fat test. We get 40 cents per pound for fat in milk from April to September and 45 cents the remainder of year, 36 cents per pound in cream. Probably a majority sell cream. Farther back from railroad many men keep large herds and make butter.

The dairy cattle are almost exclusively Jerseys and Jersey grades; we have many very fine herds of registered Jerseys. The demand for good dairy cows is very satisfactory. I sold a carload of registered cows a few weeks ago at $125 per head. Well-bred unrecorded cows bring $50 to $70 each. Owing to lack of help many men are selling their dairy cows and going in beef raising. We have been breeding Jerseys for 20 years, but for the above reason have quit the dairy business and many others are doing the same, but all farmers here grow cattle or mules. You never pass a farm without some line of live stock, and the quality is being steadily improved. It is the exception to find a farmer who will use a grade sire of any kind, horses, hogs or cattle.

We are having plenty of rain and pastures are extra good. All lines of stock are doing well. The beef raisers are feeling good at the outlook for this Fall's sales, but as most of them depend on buying to replace, they are finding it hard to buy suitable stockers to carry over. Since selling our dairy cows we purpose to grow beef, pork and mules, and all our farmers are trying to carry the maximum of live stock of some sort, especially beef cattle. The black Angus seem to have the lead in popularity just now. This region has as many good Jersey cattle as any equal extent of country I know of. There is a market here in Eastern Tennessee for all the dairy output at the prices mentioned. Cows are in good demand at fair prices as buyers from Illinois, Indiana and Ohio come here each year to replenish their herds. While some of us are going out of the business for lack of help, others who have the help are going in, as it is fairly profitable and builds up our lands rapidly. As a whole the stock growers of all kinds are feeling enthusiastic, and are all trying to do a little better each year.

Loudon, Tenn. C. L. G.

Hog Growing on the Pacific Coast.

I AM on a small farm of 10 acres. I expect to keep 20 brood sows. Is that too many to keep on a small farm? I can dispose of all pigs at six to eight weeks old, for $3.50 to $4 apiece. I can raise potatoes and root crop to make about two-thirds of my feed bill. The other third I shall have to buy, which will average about $30 a ton for wheat, corn, oats, barley, and Alfalfa meal. Would a silo in my case be a good investment for me and what size would it require for 20 hogs? What is the best mixture for brood sows if I built silo?

Washington. W. T. J.

Twenty brood sows should produce you at least 240 pigs a year, which at $3.50 or $4 each, at two months old would figure close to $1,000. Ten acres should keep the 20 brood sows easily. But you may find it more profitable to keep a few head of good cows along with the hogs, as you undoubtedly will find it more profitable to feed most of the mill feed to the cows and keep your pigs growing with the skim-milk. A few head of well-bred Jerseys would be just the thing on such a hog ranch. As for a silo for storing hog feed I believe it would be very good, although we have not fed silage to our hogs to any great extent. For such a place I would not advise a silo over eight feet across, but put them up as high as you can. As for a mixture for the silo, we are growing less stalks and more ears. Much of the corn we grow for the silo is sweet corn, especially when we mix it with sunflowers. We tried sunflowers last year for the first time and were well pleased with it. The cows would not eat so much of it, but seemed to do as well as, or better than, they did on corn straight and kept up in better flesh. Yes,

SANITATION

would have saved a great many of the 7,420,912 hogs valued at $59,455,700.00 lost in United States during 1913 from

Make Your Winter Barn Work Easy

WM. LOUDEN Originator of Modern Barn Equipments.

Write us for free sketches and suggestions for your new barn. State size and kind of barn needed; number of cows and other stock you wish to care for. The service will cost you nothing, and we may be able to save you money and trouble.

Louden Barn Equipments meet the needs of the business farmer—the man who farms for profit.

The Louden Litter Carrier saves time in the morning and evening, when time is most precious. With a Louden Carrier you can

CLEAN THE BARN IN HALF THE TIME

The Louden Carrier moves easily suspended from an overhead track, behind the stalls. You can place it at a convenient height for loading, raise it with a light pull, and send the load out to the pit or manure spreader. It never balks. Let us tell you of the many special features.

Louden Carriers are easy to install. No expert needed; their cost is so little they will pay you even if you have but a few cows or horses.

We manufacture carriers for all purposes: Feed and Litter Carriers, Milk Can, Harness and Merchandise Carriers. Also Louden Stool Stalls and Stanchions, Spring-Balanced Mangers and Manger Partitions; Cow, Calf, Bull and Pig Pens, Go-Right and Alignment Devices, Hay Tools, Power Hoists, Window Ventilators, etc.

Write for our free book "Some Interesting Facts on a Homely Subject." It gives important facts about fertilizing values of manure.

Illustrated Catalogs FREE. See Your Dealer or Write Us. 116

and something put our cream test up when we were feeding it too.

Now I've done it. I can hear some of your readers saying, "But you cannot feed cream into milk." Very well, that is what the experiment stations will tell you, but my experience tells me that I can and do. Hogs are very fond of sunflower seed when they learn to know what it is, and I believe a mixture of sweet corn and sunflower silage would make great hog feed. If you buy mill feeds for your hogs do not leave out oil meal to feed with your roots and milk, as it is the cheapest feed we have on the coast today. Vetch sown early in the Fall will be ready to put in the silo by the fifteenth of May or first of June, and unless we have a very dry season you can get a good crop of corn or kale off the vetch ground that same year. Vetch makes fine silage to feed any kind of stock and you will find kale a great growing feed for hogs. CHAS. H. HAYS.

Oregon.

TALKS WITH PRACTICAL FARMERS.

Hogs in an Orchard.

T. B. WILSON of Ontario Co., N. Y., said: "We allow hogs access to our orchard. We leave the rings from their noses, and I am satisfied they can be allowed the run of the orchard to advantage up to the time the fruit is well matured. There may be objections to the practice in some cases owing to packing the soil, but our farm is well underdrained. In fact I would not consider planting an orchard without thorough underdrainage. Apples are like Alfalfa and many other crops, the orchard will not do well with wet feet. Of course, one does not want too many hogs in an orchard, and there is danger of their rubbing the trees and in this way injuring them. The practice I follow is to sow shelled corn broadcast on the ground, allowing the hogs to root around and hunt it up. I do this in orchards where the trees are large, and I find the hogs dig up the soil. Most of my orchard is cultivated and I allow hogs access to this part as well as that which is in sod. I use as a cover crop two pounds of Cowhorn turnips, six pounds of Mammoth clover and a bushel of barley or oats."

W. J.

Buy Springers in the Fall.

"I AM not a cow man, and I would not follow dairying," said Mr. O. J. Burley of Monroe County, N. Y., "but last Fall, hay was very cheap, and I tried out the idea of buying some cows, keeping them and selling them to dairymen in the Spring. I visited a dealer near Rochester and asked for springers. The dealer is reliable and I based my purchase not only on his guarantee, but on what looked good to me. I could not buy high-priced animals; could not go as heavy as $75 or $80, which our dairymen did. The first purchase was eight cows and I kept this number constant, until the first of March. We paid $45 each for the first eight cows, then we sold five of these at the end of three weeks. Of these I sold two for $105. I figured that we made $7.50 each on the first five and made quick sales. I went to the same dealers and secured five more, and I sold these in March to dairymen for about $75 the head with calf at the side. These cows paid for hay, grain, all bran for six horses, and all other feed for the horses except oats, the manure paid for the labor, and I had one cow left out of eight for profit. The cows were not at first good lookers, but they responded nicely to feed, and the prices received measured up with the prices which good milch cows brought. I could have gone to auctions and made some money had I been a cow man, but I bought from a dealer and put up the proposition that they must be guaranteed with calf, have good teeth and good udders, and I was allowed privilege of return or exchange. I based my judgment on the proposition that almost any kind of cow that had size and would calve in the Spring, and could be bought for $45 or $50 in the Fall, in the Spring when fresh would sell to dairymen from $75 upward if she could be put in good condition. I could have paid more for possibly better stock, but that would be narrowing my margin of profit, and secured this class of stock, which I considered would afford opportunity to realize not only on feed, but allow profit. This provided Winter labor, and afforded a good lot of manure which I applied to an old peach orchard. This manure was hauled out as fast as made and the results are striking between those trees unmanured, and those which are given the manure. In fact the trees manured doubled in growth over their neighbors. This is just a little business deal, but we must be wide awake to opportunities to turn dollars our way. It is only business, and farmers must become keen business men."

W. J.

Fighting Animals; Dogs.

I READ with much interest the Hope Farm man's account of an encounter with a savage heifer. I had a similar experience just two years ago, though mine was with a 1,600-pound Holstein bull. I had been grooming him preparatory to exhibiting at our Winchester Fair, and one morning, after completing one side, started around to opposite side. He turned and pinioned me in the corner of the stall, getting his head against my thighs. I thought at first he was playing, and tried to drive him off, but this seemed to encourage him, and he pressed harder. Considering myself in a perilous position I yelled, and our dog—half shepherd, half bull—came to my rescue through the door, which was fortunately open, and jumped over the manger driving the bull in a corner. It was several minutes before my son arrived in response to my call, and had it not been for my faithful friend I'd no doubt have been a goner. It was fortunate that he did not have his head higher, else I might have been injured internally. He was fortunately dishorned. I believe every farm has a place for a good dog, though some correspondents condemn all dog kind. On a previous occasion this dog began scratching at the door about time we retired. After we had retired he ran around the house barking and finally stopped under my bedroom window and barked. Thinking something wrong I got up and went to the window and saw a reflection causing me to think the barn was on fire. I ran downstairs and out and found a wind that had risen had kindled a supposedly dormant fire under the wash kettle. After putting out the fire there was no more noise from Billy that night. Can I be blamed for thinking lots of Billy? G. L. R.

Virginia.

UNCLE Zeke Howell had spent all his life on a farm. One day a nephew of his visited the farm and during the conversation that ensued the old man learned that the youth was attending college. "An' so ye go ter college, Sam?" queried Uncle Zeke. "What might they learn ye there?" "Lots of things, Uncle," answered the young man. "Latin, Greek, and also German and algebra." "Ye don't say?" returned Uncle with a surprised look. "Well, now, what might be algebra for turnips?"—Everybody's.

DAIRY CATTLE

FOR SALE—Young High-Grade Jersey Family Cows. Springers A. L. FITCH, Westmoreland, N. Y.

FOR PRODUCTION—BREED UP, NOT DOWN—Registered Jersey bull calves, only, from producing dams and highest type sires. R. F. SHANNON, 603 Renshaw Bldg., Pittsburgh, Pa.

"MERIDALE FACTS"

for 1914 presents a significant record of herd building. It tells of 135 tested cows in the Meridale Herd with an average yield of 7982 lbs. milk, 512 lbs. butter per cow. 31 of them were two-year-olds. It shows an average increase of 1033 lbs. milk, 98 lbs. butter per cow during five consecutive years of authenticated testing.

We shall be glad to send you a copy, and to tell you of some of the bulls and heifers now for sale from the herd of which this steady progress is recorded. These youngsters are bred to work similar advancement for you.

FAYER & McKINNEY
300 Chestnut Street, Philadelphia, Pa.

AYRSHIRES FOR SALE
8 head cows, heifers and calves, some imported, from imported dams and sires, 2 fresh and 2 to freshen before Oct. 9, 1914. In calf by prize winner at International Stock Show, Chicago, 1913. Purebred Registered
HOLSTEIN CATTLE
Twenty-five cows and one bull, all pure-bred registered Holsteins, were recently unloaded at Williams, Minn. They were purchased by the Security State Bank of that place, and sold to farmers on easy terms. These far-sighted financiers selected pure-bred registered Holstein cattle because they were sure that it was for the best financial interest of the community. They acted on their knowledge of Holsteins as producers as compared with other breeds. If purebreds were good for them, why not for you?

Day after Day, Year after Year,
PRODUCTION COUNTS
It is not what a cow can produce in 7, 14, or 30 days, even in a year that determines her value to the farmer. It is what she can do in a lifetime.
Brown Swiss Cows rank high in average production and are regular and persistent breeders and producers. Year in, year out, they make good records and raise good calves without any coaxing or pampering. If interested, we will send you an illustrated booklet.
The Brown Swiss Cattle Association
IRA INMAN, Secretary BELOIT, WISCONSIN

Partitioning a Silo.

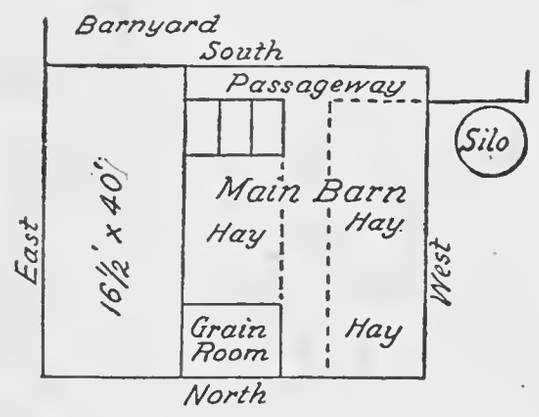
I HAVE a silo that is too big for me, and I have been thinking of putting a partition in it. I would like your advice about it. Some thought the corners would not settle well enough, but I would pack it well there. Do you think if I make it airtight every way it will do? I cannot keep cows enough for the one I have now, so I thought if I could make two of it I could feed them Winter and Summer. E. H. A.
Woodstock, Va.

Certainly it is feasible to divide the silo, making two pits out of the one. My understanding is that you will continue to fill it, but want to save half for Summer feeding. These narrow pits would have more proportionate wall friction than a large silo, and would require more care in filling to make it compact along the walls. You can easily make it airtight by using matched flooring nailed to the 2x4's for the partition frame. In the corners, nail half of an 8x8 sawed cornerwise, well painted in with gas tar. As you would fill in both sides with the silage at the same filling, the pressure would keep the partition in place, but when feeding out one side, should you notice it springing out, it will be easy to stay it across the silo to the other side with light timbers of some kind. I am inclined to believe that if you feed through the Summer, you will not need a partition, as the removal of two layers a day, will keep ahead of any loss by fermentation, and that the loss at best would not approach the cost of a partition. If you will in the Summer—after each removal of silage—sprinkle a pail of fresh water with a garden sprinkler over the silage surface, it is probable you would have no trouble, of course being careful not to disturb the remaining silage more than possible. An old canvas spread over the silage between feeding, would be a considerable help.
JOHN GOULD.

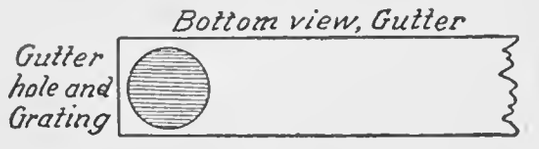
Plans for Cow Barn.

WILL you give me plans for ventilating, lighting and arranging floor space for cowbarn I am going to make in a part of my farm? Floor space 16½x45 feet. I want 12 cows. Is it too many? Cement floor; planks for cows to stand on, solid cement gutter; cement feed trough, water turned into feed trough for cows. How much room for each cow? How long a cow platform? How deep and how wide gutter? Is this plan feasible? To slant the gutter slightly toward one end and have at the lower end a drain of four-inch tile to collect and carry to manure pit the excess liquid?
Would this trap catch loose manure and if cleaned out when necessary prevent tile pipe from becoming clogged? It would be a great saving in absorbent material. Please tell me how to make a manure pit for 20 head. C. C.
Massachusetts.

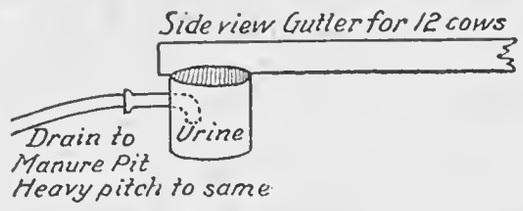
A stable 45 feet in length will accommodate 12 cows and give needed passage way at the side. Cows should be given from 3½ to four feet of platform each,



and this platform should be from four to five feet in depth from stanchion to gutter, the depth depending upon the size of the cow. When standing in natural position, the cow's hind feet should be close to the edge of the gutter. The gutter should be wide enough to admit readily the ordinary stable shovel; 15 inches being a good width; and a depth of eight inches in front and six inches at the rear is a convenient one. The walk behind the gutter and the cows should be about four feet in width and two inches lower than the standing platform of



the cows. This slight elevation of the cows gives them a better appearance to an observer behind them; 16½ feet will provide sufficient room for cows and the feeding alley in front of them; this latter should be from four to five feet in width for convenience. I see no reason why your plan for carrying the liquid manure to a pit is not feasible, though if the horse manure or some other good absorbent can be used in the gutters such a drain is not needed. Manure pits are simply reservoirs of the required size with water-tight sides and bottom to hold the liquids. They are usually rectangular in shape and not more than four feet in depth; two feet of the pit may well be above ground if the walls are built of concrete, as they usually are. The bottom may be of concrete or puddled clay. If placed where a wagon may be loaded



from either side of the pit some labor is saved. The size will depend upon the number of cattle and the length of time that will intervene between the removals of the manure to the fields. M. B. D.

Turnips in Silage.

WHEN I planted my corn I mixed some Swedish turnip seeds in with the fertilizer, and now they are quite thick and heavy in places. I am thinking of cutting them up, roots and all, together with the corn into the silo. If I do, what will be the effect on the silage? Will they hurt the keeping quality. A. S.
New York.

We have had reports from farmers who mixed mangels in with the corn. The mangels were put right into the cutter, chopped or pulped and blown into the silo. They made a wet pulp which mixed in with the corn and made a good feed. We do not know of cases where turnips have been used in this way. We think they would give a bad taste to the silage. Has anyone tried it?

Fencing in Sheep.

I AM keeping sheep and our neighbor refuses to fix his fence. I notified him when I got the sheep. Am I responsible for damages done by sheep on his farm when they go through his fence? Is he obliged to fence against sheep? If so, how should I proceed to make him fix the fence? S. W. W.
New York.

If the electors of your town have some rule as to what shall be deemed a sufficient division fence in your town and your neighbor is not complying with the rule, he could not recover against you for damage done by your sheep. In the absence of any such rule, and if your neighbor maintains a fence of the height or strength of division fences generally in that town, you would be liable for the damage done by your sheep if they escape on to his land. Division fences are not generally of a character to keep sheep out, and if you wish to keep sheep, you will have to fence them in or be liable for damage, unless, as said before, the electors of the town have made a rule in regard to fences. M. D.

Ration for Milch Cow.

WILL you advise me whether the following feed for a cow is calculated to secure the largest yield of milk? Morning and night two pounds bran, two pounds stock feed. Cow is on pasture during day, gives about 10 pounds milk at morning milking and eight pounds at night. Milk very rich in cream. Cow is about size of Jersey; six years old, and called a "dark Jersey." I am aware that 18 to 20 pounds milk per day is not large, and trust you can suggest a feed formula that will tend toward an increased yield.
Massachusetts. J. W. C.

I am not familiar with the stock feed you mention, but assuming it to be like most of the compounded feeds on the market, I believe the following will give better results: Bran, one pound; brewers' or distillers' dried grains two pounds; cornmeal one pound. Feed at morning and night, as at present. Eighteen to 20 pounds daily, it is true, is not a large production, yet if the milk is very rich it is by no means a bad performance for a small cow, and as you are feeding very well at present you can hardly expect a large increase of milk by a change of ration. C. L. M.

AILING ANIMALS.

Horse Walks to One Side.

WHAT is the matter with a horse when he persistently walks to one side? Mine walks to the left on the farm and on the road. Is it an indication of pain or weakness that might be remedied? L. W. R.
Michigan.

A horse tends to walk away from the shoulder that is sore; but if no such soreness exists one may conclude that persistent abnormality in walking is a matter determined by the brain or spinal column and that such an abnormality is incurable. A. S. A.

Locomotor Ataxia.

I HAVE a colt about 15 months old. He has developed nicely and grows rapidly. About five weeks ago I noticed that he did not travel right. He drags his hind feet, staggers one way and another and blunders along. He appears to have lost part control of his legs. In the pasture he stands with his head down much of the time. His eye is a little dull at present, but much brighter than it has been. His appetite is good and his hair looks well. His mouth, tongue, and teeth look stained much as a boy's after he has been eating choke-cherries. What is the trouble with the colt and tell me the remedy, if any? L. P. H.
New York.

Ineo-ordination of motion indicates disease of the spinal cord, or pressure from an abscess, or collection of serum; or it might come from lightning shock, or osteo-porosis (big head). Without an examination we are unable to confidently prescribe treatment in such a case, hence we should advise you to consult a local expert. A. S. A.

Controlling Dogs.

MY ideas of controlling the dog nuisance are as follows: First I would bell the dogs in place of sheep. Let the State furnish the bells to the trustees of each township. Charge all dog owners say $2 for first bell $4 for second and for female $5. Have the law to compel every constable to kill all dogs not belled. Also anybody may kill them if he wishes to; only protect the dog that is properly belled. Have good shrill-sounding bells, so they can be heard a long way. Then if the dog gets after sheep you can hear the bell and go to the sheep's rescue. Also the dog owner can tell where his dog is by the bell. Yours for better sheep husbandry. A. D. WOLVERTON.
Indiana.

Sore.

MY horse in some way knocked off a patch of skin the size of a quarter on the inside of his right foreleg just at the knee; this was about six weeks ago. I have washed it with disinfectant, and peroxide of hydrogen, but it does not heal, exuding bloody matter almost continually. What can I do for it? There seems to be no single opening, for the matter to exude from; it exudes all over its surface. The flies bother it, and the horse rubs it and starts fresh bleeding quite often. This horse also has round bunches come under the skin about the size of a cent or smaller; these remain for a time and then disappear, to be replaced by others. They do not fester or break except under collar, then they will bleed a little, scab over and finally heal.
Massachusetts. W. G. F.

Once daily swab the sore with tincture of iodine and as often as found necessary to keep it dry and keep flies away dust it with a mixture of one part of iodoform to two parts each of powdered charcoal, sulphur and slaked lime. Tie the horse so that he will be unable to bite or rub the sore. The "bunches" might indicate farcy, the skin form of glanders, and on that account it would be well to have the horse examined by a graduate veterinarian, or they may be due to derangement of the digestive organs and skin. Reduce rich feed. Increase exercise. A. S. A.

Spavin.

CAN a bone spavin on a horse be cured? If so, how? If not, what will take the lameness out? E. R.
New Jersey.

The bone spavin cannot be removed, but the lameness may subside if you have the spavin and entire hock joint fired and blistered by a graduate veterinarian, and then tie him up short in a narrow stall for a six weeks' rest. Better postpone the operation until late Fall, when flies are gone. A. S. A.

Supernumerary Teat.

ONE of our four cows (a heifer) when she freshened milked from five teats. The fifth one is about one-half size, and I have milked it for several months. It is a great nuisance, taking as long as the other four sometimes. Will it be all right to let it dry up? 2. Another heifer sometimes is slow in urinating. One day she will pass off a good stream and the next it will be slow and scanty. What is the matter with her? She is in good flesh and large size. One of her teats seems closing up; what causes that? R. B.

1. The extra gland may be dried up now, by leaving milk in it daily and rubbing well with camphorated oil twice daily, or may be obliterated by cauterization when she is dry. It would even be possible to amputate the teat, as well as do away with the secreting function of the gland, if you can employ a graduate veterinarian for the work. 2. An examination will have to be made as some obstruction probably is present in the vagina, urinary passage or bladder and may be removable by operation. Closing of the teat duct likely is due to a warty growth which should be removed or slit through in four directions by means of a sterilized teat bistoury, or you might try the effect of dilators (teat plugs) to be bought from a dealer in veterinary instruments. A. S. A.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

SAVE YOUR HUMUS
Make the most now of your corn and cabbage stubs and refuse—they are valuable as humus and vegetable fertilizer. Cut them up fine—make them immediately available. Plow them under where they will do their work but won't interfere with cultivation.
IRON AGE STUB and VINE CUTTER
Cuts corn stubs in 5 pieces, makes cabbage stubs fly apart, levels ridges so you can disc better, cuts up and returns to the soil pea, bean and tomato vines, etc. (all valuable vegetable matter), prepares ground and opens furrows for succession crops, cuts drains in low spots of your wheat fields, etc.

Great Big Wires
Open Hearth Steel
Heavily Galvanized
Tells why they last longest—why they do not rot nor sag—why they stay hog-tight and cattle-tight—why they are by far the least expensive fences to buy in the long run. Farmers, everywhere, are investigating fence quality. Users insist on knowing the quality underneath, just as they know how to judge a horse. You cannot fool an experienced buyer with an old horse doped up—polished up—to look like a good horse. You cannot fool an experienced buyer with a poor fence doped up to look like a good fence. A penny postal brings you the money-saving book. Write today.
Bond Steel Post Co., 23 Maumee St., Adrian, Mich.

AMERICAN STEEL FENCE POST
Made by American Steel & Wire Company
High-class steel, heavily coated with zinc. Strong enough to hold up any wire fence and furnish all necessary resistance. End and corner posts so strong that they will maintain any wire fence made.
Cheaper than Wood and More Durable
Adapted to all conditions and absolutely satisfactory, no matter how heavy the fence nor how hard the usage after the fence is erected. Give better service than wood post, and you get the benefit of every post in the fence from year to year, while wood posts burn, rot and decay from the start. Have been in service since 1898, in every section of the United States, and the oldest posts now as good as when set. Adapted to all fences. Increases the life of a fence. A wire fence on wooden posts is like building a brick house on a wood foundation. For sale by dealers everywhere. Big picture catalog FREE.

EVENTS OF THE WEEK.

DOMESTIC.—The American Express Company is going to invate the South American field. Its aim is to provide better transportation and financial facilities for American manufacturers who want to share in the increased trade relations between the United States and South American countries.

A despatch received by the revenue cutter service, Sept. 13, from Capt. Cochran of the revenue cutter Bear brings the news that the cutter has rescued eight members of the Stefansson expedition, a part of which was caught in the ice floes of the Far Northwest about a year ago. Since then the members of the party who have survived held out on Wrangell Island. The names of two members of the party who died are given, and another was accidentally killed. Eight others are missing. Stefansson himself became separated from part of his expedition, who were on the steamship. He is still in the Far North, conducting his explorations on behalf of the Canadian Government. Messages have been received from him which show that he and others of the original party are alive.

Reports have been received confirming the reports of a remarkable gold discovery in Broad Pass on the Sustina River, Alaska. The discovery, it is predicted, will create a new era of prosperity in this country and already has started another rush of prospectors to Alaska. According to reports from the regions in the Northwest, the strike was made where there are gold ledges 100 to 2,000 feet wide. The discovery is said to surpass any yet made in South Africa. The least valuable of the ledges are said to eclipse the Treadwell and other Juneau ledges.

It is expected that inside information of the manipulation and the alleged fraudulent action in connection with the foreclosure proceeding against the Newark Meadows Improvement Company will be revealed when several of the defendants in the suit brought by W. Russell Root, a bondholder, are examined before trial. John T. Hettrick, attorney for Root and numerous other bondholders, obtained the order at New York, Sept. 14, from Justice Guy for the examination of the defendants. Among the latter are Wilbur C. Fisk, member of the banking firm of Harvey Fisk & Sons, Albert A. Tilney, William C. Lane, Albert H. Wiggins, Charles H. Keep and the Guaranty Trust Company. The individuals named are directors of the Newark Meadows Improvement Company, and it is alleged that they wasted and dissipated the assets of the corporation through their official neglect.

James Bottenus, a former advertising man of 2095 Webster Avenue, New York, was arrested by Post Office Inspectors Barber and Shaeffer, Sept. 14, on a charge of using the mails to defraud in the operation of a real estate scheme in which a number of inaccessible lots in the Watchung Mountains, in New Jersey, were bought at $2 each and sold at from $35 to $50 each. Mrs. Rose Stack, said by the post office inspectors to be the defendant's chief agent, was also placed under arrest in Bluffton, Ind. Amos W. Jones, another salesman, was sentenced by Judge Ray in the Federal Court at Watertown, N. Y., recently to five years in the Federal penitentiary at Atlanta. Bottenus operated as the James Realty Company, with headquarters at 2095 Webster Avenue. In the advertising columns of rural publications all over the country, according to the charges against him, he inserted a simple puzzle. All those who submitted a solution to the puzzle got a deed to a lot 20x100 feet. They were then informed that since the insertion of the advertisement laws had been passed to prohibit the building of houses on any lot less than 25x100 feet in size. In this way, the post office authorities say, the prize winner was usually induced to buy another lot at from $35 to $50.

Twenty-seven persons were drowned, Sept. 15, when a St. Louis & San Francisco westbound passenger train plunged into a cloudburst two miles west of Lebanon, Mo., and two passenger cars toppled into a deep gully swollen with water. Eighteen persons were injured, but none of them was hurt seriously. Ninety-nine persons, including the train crew, were on the train.

The United Mine Workers of America accepted, Sept. 15, President Wilson's proposal for a settlement of the Colorado strike. It now remains with the operators, including the Rockefeller interests, to say whether or not they will accept the plan and end the conditions which have broken down civil government in Colorado and resulted in much bloodshed.

FARM AND GARDEN.—Representative Cullop, of Indiana, has introduced in the House of Representatives a bill to make it unlawful to ship in commerce between the States any grain or seed for the purposes of sale or barter for use in agriculture which is falsely labeled or branded or falsely represented, and to fix a penalty therefor. The bill makes it unlawful for any firm, person, corporation or association of individuals to ship, mail or otherwise convey in commerce between the States for the purposes of sale or barter any seed or grain falsely labeled or branded or falsely represented as to grade, character or name. Violation of the act will be punishable by a fine of not less than $500.

Mr. Charles M. Arthur has been appointed specialist in markets in the extension division in agriculture and home economics of the New Jersey State Agricultural College. Mr. Arthur was graduated from the Pennsylvania State College one year ago. He will devote part of his time to a study of market methods and to assistance of producers who want information regarding the best methods of putting their products upon the market. Mr. Arthur will also have charge of a news letter to be sent to all papers circulating within the State which will carry recent information of Experiment Station results and of means used to assist the farmers of New Jersey.

To place on display 140 different kinds of agricultural products in a single season is the task Charles Hardin, a farmer near Belleville, Kans., did at the Republic County fair. Of this season's display there were 72 varieties of corn and vegetables and 68 different kinds of grasses, all taken from Mr. Hardin's 160 acre farm. His premiums on the collection amounted to $24.

As a war measure the Canadian government will endeavor to have the wheat acreage doubled next year. There has been a conference between the Dominion Minister of Agriculture and experts in wheat production to devise means to enlarge the wheat acreage of Canada for the coming crop. Through agricultural papers and lecturers farmers will be advised that it will be good business and good patriotism to seed every acre at their disposal to wheat. The British government has asked the Dominion to cooperate in the work of increasing production so that the food shortage in Europe resulting from the employment of men in war may be met.

THE EUROPEAN WAR.—The battle of the Marne, occurring September 7-12, was followed by a general German retreat. This may be called the greatest battle in history as far as number is concerned, more than 2,000,000 men being engaged. The British reported the capture of 6,000 men and 15 guns, while the French are said to have captured 160 guns and many prisoners. No data is given as to casualties on either side, though it is said this equals 20 per cent., but German losses are much heavier than those of the Allies, owing to the massed formation in which they still fight. It is admitted that German losses in Belgium were fully 50,000, but apparently little news of casualties is given out to Germany by its government. Sept. 15 the Germans were taking up strong positions along the River Aisne, and another great battle was beginning. The new line of battle extends along the region of Noyon, through Soissons, Laon, the heights north and west of Reims, through Ville-sur-Tourbe, north of Varennes, and along the Meuse to the forest of Forges. This line is about 100 miles long, and throughout its length the Germans are acting on the defensive. The Crown Prince was compelled to abandon his position at Varennes and was then moving northward through the rough country between the Argonne and the Meuse.....Sept. 13 it was stated that the Russians had again defeated the Austrians in Galicia, Austria's loss being 60,000 men in killed, wounded and prisoners. Reports from Petrograd, Sept. 14, asserted that during 17 days' fighting 280,000 Austrians were taken prisoners. It is said that much distress exists in Austria. The Russians are administering the conquered districts, but disclaim any idea of annexing it. They assert they will capture Berlin. .....Sept. 15-16 a naval battle was in progress in the Baltic, between German and Russian fleets.....Sept. 16 the Germans had concentrated in East Prussia a force of 750,000 men. This is believed to be a larger force than is necessary for the defence of the province and it is believed that it may be used for the invasion of Russian Poland and the capture of Warsaw.....Sept. 14 the British War Office denied that any Russians had been landed in France, although reports to this effect have been brought over by many returning tourists. It was asserted that the men had been brought from Archangel, on the White Sea, by British transports, landed in Scotland and trans-shipped to the Continent..... Italy continues neutral, but pressure is being exerted by both Germany and Austria to alter this attitude. The people generally are making demonstrations of hostility against Austria.....Hostilities continue in Belgium. Commandant Meune, of the Landsturm, who was commander at Louvain, is a prisoner, and is to be court-martialled by the Belgians. The Belgians refuse to treat him as a prisoner of war and will try him upon the charge of destruction of public and private buildings. A German force of 60,000 men was rushed into Belgium, Sept. 15-16. It is considered doubtful, however, if they will make an attempt to capture Antwerp, as the dikes have been opened and the surrounding country has been flooded.....The Servians were marching on Hungary, Sept. 15, with a force of 150,000.....Turkey has decided to remain neutral in spite of pressure from Germany.....Sept. 15 it was announced officially that Great Britain's expense for the 43 days of war was $165,500,000.....The British have captured German possessions in Polynesia, and have defeated German forces in South Africa. Much German shipping has been seized in various parts of the world, and the German cruiser Hela was sunk by a British torpedo boat in the North Sea, Sept. 13. There have been some further casualties from mines in the North Sea, among them the British tramp steamer Ottawa with a crew of 26.

One Moment, Please! It Will Pay You

L. S. and P. Co. Fifth Consignment Sale

October 12 and 13, 1914

New Sale Pavilion, Syracuse, N. Y.

GLANCE OVER THIS LIST OF CONSIGNORS:

Irwin J. Schoonmaker, Kyserike, N. Y.
F. B. Loren, Central Square, N. Y.
J. H. D. Whitcomb, Littleton, Mass.
Allen R. Owen, Goshen, N. Y.
Sanford R. Clark, Onondaga Valley, N. Y.
Stevens & More, Lacona, N. Y.
E. C. Brill, Stewartsville, N. J.

J. A. Leach, Cortland, N. Y.

It is not necessary for us to go into further details, because you know the class of animals that these breeders have. The majority of the females are just fresh or will freshen soon. These are the kinds that you want NOW.

The sooner you start, the sooner you get results

LIVERPOOL SALE AND PEDIGREE CO., Inc.
LIVERPOOL, N. Y.

New Holland
Stone Crusher
The finest machine made for crushing all kinds of rock for road making or concrete work. Easiest running and most durable. *Equipped with Pulverizer to grind rock fine for building and land purposes.* A money maker for contractors or farmers having 4 to 12 h. p. A chance to increase value of your own farm and *establish a big money making business.* Write today for catalog, facts as to value of raw limestone on land, and *free trial offer.*

NEW HOLLAND MACHINE CO.
Box 41, New Holland, Pa.

Maple Syrup Makers

With our evaporator you will make better syrup with less fuel and labor than with any other system. Will last lifetime. Made in 23 different sizes. Write for catalog and state number of trees you tap.
GRIMM MANUFACTURING CO.,
619 Champlain Ave., :-: Cleveland, Ohio

FOR SALE—First-class farms, from 150 to 450 acres. Write for descriptions. F. E. BASSETT, Walton, N. Y.

Profitable Burlington Co., N. J., Farms—All sizes, all purposes. Established 1898. A. W. DRESSER, Burlington, N. J.

$10,000.00
BACKS THIS SAW. IT IS THE BEST AND CHEAPEST SAW MADE.
As low as $10

HERTZLER & ZOOK Portable Wood SAW
is easy to operate. Only $10 saw made to which ripping table can be added. Guaranteed 1 year. Money refunded if not satisfactory. Send for catalog.
Hertzler & Zook Co.
Box 3, Belleville, Pa.

Save Work, Time, Money
By using our low down steel wheel wagon

Electric Handy Wagons
saves high lifting, lighten draft, don't rut roads. Spokes don't loosen—wheels don't dry out or rot. Write for free book on Wagons and Wheels.
Electric Wheel Co., 48 Elm Street, Quincy, Ill.

150 Farms FOR SALE—near Phila. and Trenton markets; good railroad and trolley facilities. New catalogue. Established 25 years. Horace G. Reeder, Newtown, Penna.

Farms in Delaware—All sizes, productive soil, genial climate, close to markets, fair prices, free booklet. Address STATE BOARD OF AGRICULTURE, - DOVER, DELAWARE

121½ ACRES—21 Acres Timber
wire fenced; 8-roomed, two-story house; large basement barn; ice, hen and wood house; plenty fruit; insurance, $2,300. School, church, ½ mile. Creamery; 14 head of cattle; pair horses; brood sow; wagons; grain drill; 4½ horse power gasolene engine, mowers, rake, plows, harrows, buggies, harnesses, hay fork, everything goes for $5,000. HALL'S FARM AGENCY, Owego, Tioga Co., N. Y.

WILL SELL FARM
440 acres. One of the best farms in Southeast Virginia. Suitable for one to four farms. Large Colonial buildings; grand location; excellent water and climate; adapted to hay, wheat, oats, corn, peas, beans, tobacco. 200 acres creek-watered pasture, 100 acres oak and pine, 240 acres improved. Large stock. For full particulars address BOX 56, Blackstone, Virginia

Roof Protection at a low cost against Fire, Storm and Lightning
The danger from lightning can be avoided, roof fires never occur, and the weather is kept out when your buildings are roofed with
Kanneberg
Metal Shingles
"We Pay the Freight"
Lightning never damaged a Kanneberg shingled roof, because they are fire-resisting. Rain, snow, heat and cold stay outside. Kanneberg Shingles need no repairs, because they resist rust, don't rot, crack, buckle, curl, nor fall off. Can be laid on low-pitch roofs and always look well. Give clean cistern water.
FREE—Send for our big catalog at once and you'll SAVE BIG MONEY on roofing and you get the best protection. Take advantage of our LOW FACTORY PRICES. Catalog shows many designs and sizes.
Kanneberg Shingles come singly, 8 to a sheet, or in clusters 2 feet by any length from 5 to 10 feet. You can put them on quickly. Easy to lay.
Write for catalog and give dimensions of roof, so we can show you how little it will cost to get perfect roof protection for years.

:: The Favorite Hen ::

Thirty Women Enter Birds

WE have done our best to make a fair selection of entries from the 90 women who offered a hen for the egg-laying contest. We could only enter three pens of 10 birds each, and when it came to making a fair selection of one-third of the entries we found ourselves facing a hard problem. We put the case fairly before these women and they unanimously agreed that they were satisfied to let us decide. Many of them suggested that the names be put in a box and the "Hope Farm Redheads" draw 30 names at random. Instead of trying any plan of chance we obtained, as far as we could, a history of the various flocks and the conditions of their owners. We wanted good hens and of course responsible people. Then we wanted representatives of genuine farm flocks—not birds from commercial plants which have been advertised freely or bred expensively. The object of this contest is to encourage genuine farm women to show what their hens can do, and to let the public know something of the ability of the *genuine farm hen*. We based our selection partly upon the history of the flock from which the hen was taken. We also tried to consider the conditions of the women who enter the hens—seeking to encourage those who could not otherwise enter such a contest. We have made the best selection possible under the circumstances. We hope to give those who could not enter this year another opportunity at some future time. It was finally decided to make up one pen of White Leghorns, one of R. I. Reds and one of mixed breeds. The Leghorns will be contributed as follows:

WHITE LEGHORNS.

1. Mrs. N. D. Rand, New York.
2. Mrs. Lewis J. Happich, New York.
3. Mrs. V. D. Miller, Ohio.
4. Mrs. A. J. Skellie, New York.
5. Mrs. C. L. Todd, Virginia.
6. Mrs. Walter Fletcher, Pennsylvania.
7. Miss Tillie B. Cloud, Pennsylvania.
8. Mrs. Josephine Hollenbach, Pennsylvania.
9. Mrs. W. E. Phelps, Pennsylvania.
10. Mrs. L. E. Hilborn, New York.

There were more R. I. Reds entered than of any other breed. After a long examination we selected the following:

RHODE ISLAND REDS.

1. Mrs. Carrie Bliss, Virginia.
2. Mrs. E. S. Marlatt, New Jersey.
3. Mrs. T. Schwenk, Connecticut.
4. Miss Ethel A. Pierce, New Hampshire.
5. Mrs. Samuel O. Travis, New York.
6. Mrs. W. R. Merrick, Massachusetts.
7. Miss Edna M. Porter, New York.
8. Mrs. Andrew J. Wilson, Connecticut.
9. Mrs. E. P. Andrews, New York.
10. Mrs. Cecil Farnham, Maine.

As for the other breeds we finally decided to enter the following as it seemed to be a fair selection from all.

THE MIXED BREED.

1. Mrs. F. M. Earl, Connecticut. White Wyandotte.
2. Mrs. A. N. Conell, New York. White Wyandotte.
3. Mrs. R. W. Stevens, New York, White Wyandotte.
4. Mrs. W. S. Walters, Michigan, Barred Rock.
5. Mrs. G. L. Rothgeb, Virginia, Barred Rock.
6. Misses Osler & Wilcox, New York, Barred Rock.
7. Mrs. Robert H. Wood, New York, White Rock.
8. Mrs. Joseph di Fabrizio, New Jersey, Black Minorca.
9. Mrs. Emma H. Wood, New York, Buff Orpington.
10. Mrs. Edwin Walker, Massachusetts, Buff Orpington.

All possible precaution will be taken to preserve the identity of these birds. Legbands properly numbered will be sent to the owners so that when the hens arrive at the contest they will be properly marked. Full shipping directions will be sent in time and great care will be taken to handle the hens properly.

SELECTING THE BIRDS.

These women are left free to send either a pullet or a hen as they prefer. They will use their best judgment, but it will be well to select a strong and vigorous bird, free from disease and naturally vigorous. In spite of the best of care some hens at the egg-laying contest die or meet with accidents, and none but the strong, healthy birds should ever be sent. Have them clean and free from vermin. Most of the women have told us how they intend to select their hen, and it is evident from what they write that they will use a sort o' instinct which cannot well be put on paper. Few, if any, will be trap-nested birds. We have asked Mr. Geo. A. Cosgrove to give such advice as he can and what he has written follows:

As there are differences of breed with their varying shapes, to be considered, only general instructions can be given; but these will apply, as a rule, to most of the breeds that are likely to be entered. Length of body is one of the first

WHICH IS THE FAVORITE HEN?

things to look for. Some years ago Prof. Chas. K. Graham, then of Storrs College, gave a series of illustrated lectures in which he showed the pictures of 200-egg hens of 10 or a dozen different breeds. The most noticeable feature was, that no matter what the breed, the birds seemed extra long bodied for that breed. A long breast bone is very desirable. A short breast bone can easily be noticed by the rear line of the body sloping from the root of the tail towards the legs in almost a straight line. The rear outline should drop from the root of the tail almost or quite perpendicularly to the base line of the keel. The bottom outline should slope from the front toward the rear; giving a good distance from the pubic bones (the small bones on each side of the vent) to the end of the breast bone.

If the bird is also wide across the back, standing with legs wide apart, then she has plenty of room for her internal organs. She should also have a bright, full, round, eye. This varies greatly in different breeds; most of the Asiatics have rather sunken eyes, the skull bone projecting over the eye. In the Leghorns a large comb, but of fine texture, is an indication of vigor and of a good layer. Mr. Barron says he has tried for years to breed smaller combs, but the trap-nest generally selects the big-combed ones. He also says that he finds the high-tailed birds are the better layers as a rule. The American fancier breeds for a low tail, the tail forming a very obtuse angle with the line of the back and squirrel-tailed birds are disqualified by the standard for show birds. The good layer is a busy bird; does not mope around; is first off the roost in the morning and the last on the roost at night. In picking out birds for the contest it is better to send those which have not yet laid, but which you expect every day will lay; rather than to send those which have been laying for a month or so. The change of quarters may stop the laying and start the birds to molting. If it is a complete molt, it takes 60 to 90 days to get the new feathers and begin laying again.

GEO. A. COSGROVE.

Leghorns as Mothers.

LEGHORNS are usually considered non-sitters, and the large majority of them never show any indication of broodiness; but where they will sit and hatch out broods, they make most excellent mothers. The writer has used hens for incubation as far as possible for many years, in connection with incubators; but this year has used hens exclusively, as nothing has been hatched but English White Leghorn eggs. With about a hundred American Leghorns kept in two 20x20 feet houses, all the birds that wanted to sit were utilized, and every one has faithfully kept to her nest and hatched a larger per cent. of the eggs put under her than heavier fowls usually do. For the first time in many years *not a single chick has been killed by being trampled upon*. When on my farm, raising Wyandottes and Orpingtons, the loss from the above cause was quite a serious one, the chicks themselves not being as quick in getting out of the way, or as able to take care of themselves, as the Leghorn chicks. As careful and watchful mothers, and industrious scratchers, certainly the Leghorn cannot be excelled; and I doubt if even Games would be braver in defense of the chicks. Catching a little chick a few days ago, before I could straighten up there were three Leghorn hens on top of me, picking and striking at me and returning to the fight when I threw them off. The vigor and vitality of these English Leghorn chicks is remarkable. In June and July I have hatched out between 100 and 200, and until a week ago could truthfully say that not a chick had died after they were taken from the nest and put out in the brood houses. But every chick had its beak dipped into some loppered milk when taken from the nest, except the last brood. Not having any loppered milk at that time I let that brood go without any, and found one dead chick in that yard two days after. That is the only dead chick I have found, out of the whole two months hatches. There has not been a single chick "pasted up behind," nor a case of "big wings." G. A. C.

DR. HESS Instant Louse Killer

Kills Lice on Poultry and Farm Stock

It kills them as soon as it gets to them—that's why it's called *Instant*. Sprinkle it on the hens, roosts and in cracks—put it in the dust bath. See the name "Instant" on the can—that's the louse killer formulated by Dr. Hess (M. D., D. V. S.).

Sifting top cans. 1 lb. 25c; 3 lbs. 60c. Except in Canada and the far West. If not at your dealer's, write

Utility S. C. White Leghorns—Selected yearling hens, $1 each, $90 per 100. GEO. FROST, Levanna, Cayuga Co., New York

The Henyard

THE EGG-LAYING CONTEST.

THE forty-fifth week of the contest closed September 11 with an egg production of 2,092. This is 246 less than the previous week, and 774 less than two weeks ago. For the first time in many weeks the White Leghorns have to take second place. A. B. Brundage's pen of S. C. Reds make the highest record this week, scoring 52 eggs; being the only pen in the whole contest that reached 50 or over. This pen has a higher total record than any other pen of the Reds, and is only exceeded by six pens in the whole contest. Mr. Brundage is president of the Connecticut Poultry Association, and his Reds are so proud of that fact that they are putting in their best licks to do him honor. Tom Barron's White Leghorns tie with Francis F. Lincoln's pen of the same breed, for second place, with scores of 45 each; and Albert T. Lenzen's White P. Rocks are third with a score of 43. Merrythought Farm's White Wyandottes laid 42, the Silver Campines of W. J. H. Lobel laying the same number. It is a pretty safe bet that Francis F. Lincoln's White Leghorns will win this contest; their total now is 1,909 eggs; only one egg less than the famous "sour milk" pen from Storrs Agricultural Station, and 48 eggs ahead of Barron's White Wyandottes, which held the lead so long. The week's report follows:

GEO. A. COSGROVE.

Grains for Poultry.

I HAVE 30 S. C. White Leghorns and seven Rocks, to which I wish to feed wheat, oats and barley at present and corn later. In what amount should they be fed to get the best results? How much should they have at a feed?

Maryland. F. W. S.

You do not say whether you intend to feed these whole grains alone, without mashes, or not and it is accordingly impossible to say how much grain the 37 fowls will require. Your flock will do better if part of their rations is given in the form of ground grain mashes, either wet or dry, and the balance in two feedings daily of whole grains. If a dry mash is kept constantly before them, the better way, or a moist mash is given at noon, they may be given a handful each of the mixed whole grains morning and night. A little observation will teach you how much to give; the exact amount will depend upon their appetites and will vary from time to time. Give them all that they evidently want but not so much that part of it will be wasted. With a dry mash constantly before a flock they cannot be underfed and there is little danger of overfeeding if ordinary judgment is used. M. B. D.

Trouble With Ducks.

A YEAR ago last Spring I bought five Rouen ducks, four young ducks and one drake. I bred them with fair success. This Spring I mated the same four ducks with a drake I raised last year. I had about 40 young ducks that I hatched and thought I could raise. At present I have 16 left and do not think I shall have any in a little while. I fed on bran, cornmeal, and ground oats for mash, gave them fresh drinking water three times a day, no water to swim in, also mixed a little grit in mash. Kept them indoors nights on dry board floor, sprinkled with lime almost daily. They appeared to grow but very little; had a run on grass plot 12 by 20 feet. Every morning some of them would have their eyes closed, be very weak and drop over and die, also would get lame. Will you give information as to raising Rouen ducks, also let me know the fault of my ducks if possible? W. M.

New York.

It is difficult without seeing the situation to say just what is the trouble. The mash is good if they have grass on which to run. One of the largest duck breeders in the East feeds bread-crumbs and rolled oats slightly moistened at first, gradually changing to vegetables 1 part, green stuff one, beef scraps one, low-grade flour two, bran two, cornmeal three, with a little grit and oyster shells and a pinch of salt in each mess. Once a week a little ground charcoal is added. Adult ducks may be fed whole corn for one meal. The drinking water should be deep enough to cover the bills without allowing them to get in all over. A chance to get into the shade during the day and dry quarters at night ought to insure success. Shavings make one of the best coverings for the floor. W. H. H.

Experiment With Sweet Clover.

I AM trying an experiment with five acres of Sweet clover seeded with Spring wheat on some worn-out land that was abandoned by my predecessor in title. I encouraged this Spring wheat and clover with a light sprinkling of hen manure and litter from the hen houses, supplemented by a little potash, bone, and lime. The wheat is the "Marquis" and clover the white variety. At this date it looks like "pay dirt." I intend to use the Sweet clover for litter in the laying houses to see if it will help about solving the Winter egg problem. I enclose two samples that grew side by side.

Connecticut. FRED'K M. PEASLEY.

R. N.-Y.—We are glad to receive any experience with Sweet clover. Thus far reports are varied—some good, others negative. This idea of figuring out suitable farm crops for poultry farming is a new one. Spring wheat is not usually recommended for New England, and a "litter crop" for hens is new. Let us have all such experience.

Lice and Mites.

SMALL and insignificant as these vermin appear to the naked eye, they boast of book names that would put to blush the wooden labels in a botanical garden, and under a glass they are startling monsters of ferocious ugliness. Occupying a world of their own, they are divided into clans and families as distinct as those of any of our domestic animals, and each variety has its own preferred location and its own life habits which distingnish it from all others. Fortunately, it is not necessary for the practical poultryman to be able to identify each variety or to know all about their life habits in order to combat them successfully. Lice obtain air through breathing pores in their bodies, and anything with which they come into contact small enough or of such nature as to obstruct these pores kills them. Fine dust of any kind or greases and oils stop these pores and shut off their supply of air.

For practical purposes lice and mites may be divided into three classes, according to their life habits and the best means of destroying them. The first and least harmful class is that made up of the large body lice which live upon the skin of adult fowls and annoy them chiefly by the irritation of their presence. These are comparatively easily killed by lice powders sifted through the feathers, or by the dust baths which all fowls enjoy if given opportunity to take them. Given opportunity to take these dust baths, adult fowls will need little help in combating this class of parasites; young chicks, however, cannot protect themselves and if hatched under hens they must be greased about the head and perhaps under the wings when a few days old and the mother hen must be at least temporarily freed from the pests by the use of insect powder. Young chicks cannot thrive, or even live, under lousy hens.

The second class is composed of those which burrow into the skin or beneath the scales of the fowl's body and legs. The depluming mite which burrows into the skin at the base of the feathers and causes these to drop out, and the mite which causes scaly leg by burrowing beneath the scales of the feet and shanks belong to this class. These cannot be reached by dusting powders and must be attacked with some grease or oil that can penetrate to their habitations. Any non-irritating grease or oil may be used, ordinary lard being as good as anything, though it sometimes needs reinforcing with mercurial, or blue, ointment in the proportion of about one fourth part of the latter. This can be rubbed in and reaches the pests. As a liquid dip for legs, kerosene or coal oil is efficient and handy. The mercurialized lard also may be used about the vent or on the head of young chicks to kill the large lice, but it should be used sparingly on these.

The third and most destructive class of parasites is represented by the common red mite. These mites do not stay upon the fowls during the day, but live in cracks and behind loose boards about the nests and perches and come out at night to feast upon the blood of their victims. Careful search will find them in any neglected hen house and no fowls can thrive where they are present. These are to be killed by the lice paints or sprays and by whitewash. For painting perches and small surfaces kerosene to which has been added one fourth part of crude carbolic acid is cheap and effective. Carbolineum is also good but expensive. Any hard grease like tallow may be melted and applied to perches by means of a brush; this will fill the pores of the wood and lasts longer than the liquid paints.

Will Double-yolked Eggs Hatch?

WILL double yolked eggs hatch? If not, why not? If not, how are abnormal chickens (two heads, four legs, etc.) accounted for? L. A. R.

Cassopolis, Mich.

Without pretense of being an authority on embryology, I may say that I doubt if anyone knows why double-yolked eggs do not hatch; if, indeed, they never do. Lack of room and nourishment would explain why two chicks could not reach full development in one shell, but it would not explain why development should not begin. Personally, I can see no reason why two yolks should not each be fertilized by the male element swarming within the oviduct and begin development when placed under favorable conditions, even though enclosed within one shell. The existence of two yolks within one shell need not be invoked to explain such abnormalities as two heads, four legs, etc. This variation in the number and orderly arrangement of multiple parts, such as legs, wings, etc., is known to biologists as meristic variation, and is explained by the fact that all parts of an animal are produced by the multiplication of certain cells, each part being made from its own kind of cell—a cell is a small bit of living matter enclosed in its own membrane and uniting with its fellows to make up a tissue as bricks unite to make up a wall. By the slipping of a cog in nature's machinery, these cells sometimes fail to stop multiplying when just enough have been produced to form the part which they are to build and a duplicate part is formed; then we have a freak like the two-headed calf, or the four-legged chicken. M. B. D.

5,000 S. C. White Leghorn Pullets

April Pullets —to lay in October
In lots of 100 $2.00 per head
In lots of less than 100. $2.25 per head

May Pullets —to lay in November
In lots of 100 $1.75 per head
In lots of less than 100, $2.00 per head

Order Quick

These birds will go fast. A more magnificent lot of pullets were never offered for sale. The blood of the greatest layers in the country is in them. They're beauties. They're sure profit boosters. Write today.

What Is an Education?

Need of Imagination to Practical Men

By Dr. E. H. Jenkins

PART I.

We regard Dr. E. H. Jenkins, Director of the Connecticut Experiment Station, as one of the wisest men ever connected with agricultural education. The following notes are made from an address delivered by Dr. Jenkins before the students of the Pennsylvania State College.

A CONTRAST OF RESULTS.—I shall say something about college education, *not* as a teacher or expert but as an outsider. For I am not an educator. I have not talked to a body of students more than two or three times in my life and have never conducted a recitation but once. I speak therefore as a rank outsider, but one who in almost 40 years of experience in the work of an agricultural experiment station and among farmers has had a chance to see the results of education and contrast sound mental training and habits of thought with the faulty, superficial kind. *Practical* results I mean, both in the business of farming and in the work of research. Now education I take to be the handing down from one generation to another, for its use, the Heritage of the Past, just as a faithful public officer not only hands over to his successor the public property in his charge but its heritage. He explains the office routine, the methods which have served him best, the tradition of the office, so that the newcomer may be saved from mistakes and the public better served. Just as the sailor on the sea, before going below after his trick at the wheel, says to the man who relieves him: "Keep her S. E. by S. half E. and call the cap'n at seven bells. The barometer is going down a little." He does it for the safety of the ship and all aboard her. Just so before our generation goes below to rest from its labors it must give to you what it can of the course to be held and the watch to be kept, both for the sake of you and of this dear old world itself.

WHAT MAY BE GAINED.—No man, of course, can gather to himself anything but an insignificant fraction of this heritage. No teacher can hold or impart more than a tithe of our small department of the store of human knowledge. All that the teachers in this or any other college can do is to give you a *taste*—a sample—of this store, a longing for more of it, and to show you how to get at the sources of it from which you may draw more, both now and through your whole life. For education is not a thing of course A or B of so many hours a week for so many semesters, with a degree at the end of it, like a period in punctuation which marks a full stop. Education should be to each man a continuous performance, a matter for all time, if not for eternity. Your course here should be only a start, and its chief importance is in making the right start, and in *that* you have the same responsibility as your teachers.

THE HERITAGE OF THE PAST.—What is it? A part of it is very obvious. There is the great body of established facts regarding the properties and relations of material things; surest of all, the facts of mathematics. There are all the great facts of physics (celestial and terrestrial), of chemistry and of the other natural sciences. There are other things which are more or less in the nature of hypotheses, like the existence, the nature and properties of atoms, which have so greatly helped to explain the facts of the physical universe and have so advanced our knowledge in many directions that we feel the theories must have truth in them though it seems likely that our statements of them still have a good deal of occluded error. The essential essence of many of these things we do not know, but of the phenomena of their action and interaction we have a good deal of knowledge. Electricity is a striking example. Very few physicists, I think, would feel confidence in any definition of it, but how much we have learned regarding its applications to the work of the world. Within the memory of some of us it has risen from its lowly place as a lecture-room curiosity to an indispensable servant of civilization. With this knowledge of the properties and uses and interaction of material things is closely associated the establishment of certain great laws or rules of conduct in the material universe.

PRACTICAL TRAINING.—Now there is a widespread feeling that these things which I have mentioned are really the essentials of education, at least, of what is called "practical" education, "vocational" education, education while you wait, or by whatever other name it goes. There is a valid distinction to be made between cultural and vocational courses. But the thought I want to leave with you—and this is the gist of what I have to say—is this: Culture is "vocational," culture is practical, and cultural study contributes to business success, to pecuniary profit. By cultural study I mean that which relates to the working of the mind on matters not visibly or immediately concerned with technical training for a given calling, such as the humanities, as they are called, the study of history, of literature, of philosophy and ethics. These are certainly a part of our heritage of the past. There is the history of peoples, the channels in which human thought and endeavor has flowed, the experiments in human government and their results, the literature, the philosophy and the religion of the past. I believe all these have had their effect on the agriculture of this country. Some comprehension of them makes the farmer and the experimenter a better man of affairs, a better "practical" farmer and a better citizen than he can be if his whole time and thought has been spent on the details of his own specialty. I have not time, nor ability, adequately to set forth the particular ways in which these things minister to the life and work of investigators such as I hope some of you will be, or of farmers which I hope more of you will be. But I am sure that they have a very practical use in every life.

THOUGHT AND KNOWLEDGE.—No man can have any comprehensive knowledge of all the heritage of the past. No educated man should be without some little knowledge or comprehension of the different departments of it. Such knowledge opens his mind to receive impressions from all sides, it enlarges his field of thought and it brings in unexpected ways help for the solving of any special problem of whatever kind it is. The efficient research man does his work quite as much by brooding as by working; by considering the relations of facts and their probable meaning; yes, by imagining in the first instance what may be the explanation of a phenomenon. Education—some knowledge of the heritage of the past—results in an attitude of mind which is pliable, receptive, judicial, imaginative and, as Lowell says, of "unsullied temper." It is a mind which can handle and apply general principles, and without this thinking, brooding mind a string of facts "practical" in themselves are of little practical use. The storeroom of a manufacturing plant, with its supply of nuts, bolts and all the machinery parts, is only a junkshop without a mind which knows the place and purpose of each one of them and has before it the vision of a complete and perfect machine. Just so without the power to see the use and the application of each, the facts learned in the class-room are mere educational junk. I get several thousand letters every year from farmers. From the kind of questions asked I can tell pretty well whether a man has had some kind of decent college training or not. The uneducated man wants some kind of a receipt for success in growing his crops. The other wants rather a guiding principle.

(Concluded next week.)

AGRICULTURAL EXPERIMENT STATIONS

WE have many calls for a list of the Agricultural Experiment Stations in this country, and therefore we print a list of the stations herewith. There is also a map showing where these stations are located, so that our readers may understand what part of the State is represented. There are many bulletins issued by these stations which would prove of great value to our readers. Many of them issue lists giving the titles of their bulletins, and very likely you will find in such a list a discussion of just what you would like to know. As a rule, the stations are willing to send their bulletins to all who ask for them. Preference is given to citizens of the State in which the station is located, yet if they have a good supply of the bulletins on hand they are generally willing to supply outsiders.

Don't buy any of the above till you get our Catalog and reasonable prices. We'll surprise you. Hundreds testify to the wisdom of this counsel. Send for new 1914 Catalog full of pictures. A. W. GRAY'S SONS, 14 South Street, Middletown Springs, Vt.

MAKE BIG PAY DRILLING WATER WELLS
Our Free Drillers' Book with catalog of Keystone Drills tells how. Many sizes; traction and portable. Easy terms. These machines make good anywhere.
KEYSTONE WATER DRILL CO Beaver Falls, Pa.

WELL DRILLING MACHINES
Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

LET US TAN YOUR HIDE.
Cattle or Horse hide, Calf, Dog, Deer or any kind of skin with hair or fur on. **We tan and finish them right;** make them into coats (for men and women), robes, rugs or gloves when ordered.
Your fur goods will cost you less than to buy them, and be worth more. **Our illustrated catalog** gives a lot of information which every stock raiser should have, but we never send out this valuable book except upon request.
It tells how to take off and care for hides; how and when **we pay the freight both ways;** about our safe dyeing process which is a tremendous advantage to the customer, especially on **horse hides and calf skins;** about the fur goods and game trophies we sell, taxidermy, etc. If you want a copy send us your correct address.
The Crosby Frisian Fur Company, 571 Lyell Ave., Rochester, N. Y.

For Two New Yearly Subscriptions, or Twenty 10-Week Trial Subscriptions, or Four Renewal Subscriptions. (One of the four may be a renewal of your own subscription.)

THE CELEBRATED BABY BUMPS DOLL.

The doll with the grown-up grin. Has Unbreakable Head and Hands, Jointed Limbs, and stuffed with Cork. Dressed in Rompers, with a bell rattle.

The Rural New-Yorker, 333 W. 30th St., N. Y.

:: The New Public Markets ::

What A Housekeeper Found

WOMEN of all ages, kinds and descriptions, coming and going, some laden with paper bags or various kinds of shopping bags, from the black oilcloth one to be had for 10 cents, to the pigskin leather suit case or Gladstone; others without packages but intent on getting some as soon as possible, is the sight that greets one as you go towards the market. And when you reach the market itself, what a busy scene it is! But the surprising part of it was to see so many men there of the better class, who went evidently to help their wives carry the bundles home, though some of them did not like it very well, as I could tell by their talk. Many mothers were there with babies in carriages and other children pulling at their skirts, and all had to do their share of carrying parcels home, for baby was almost out of sight from the packages piled around him by the time mother could tear herself away from all the bargains in fruits, vegetables and eggs "right from the farm." There were also chickens—cold storage and freshly killed—so the man said who was selling them. When asked if they were direct from the farm he said yes, he had bought them from a farmer, but I must say his manner was not convincing and I think he had bought them in the regular way from a commission merchant. The fricassee chickens were 16 cents per pound and broilers and roasters 20 cents per pound, being a few cents cheaper than at the regular stores.

PRICES.—There was a great difference in prices, some of the farmers charging as much for their goods as one had to pay at stores where orders are called for and delivered, and they had very inferior goods too. It is needless to say that most people looked further for their bargains, for women will not take the time to go to a market and carry things home unless the farmers make it worth their while. Peaches were from 60 and 80 cents for nice large ones to $1 for very small ones, reversing the usual order of things, small baskets were sold in proportion. Speaking of small baskets, I never knew there were so many kinds of little baskets made as I saw there Saturday, so that it is rather difficult to give prices, as you really had to see them to get an idea of how much they held, as some were heaped and others were skimped. Onions were two cents per pound; apples five to seven pounds for 10 cents for little bits of inferior fruit, and 10 cents per quart for nice Greenings. Soup greens, a large bunch five cents; egg plants four to eight cents; tomatoes from five cents for one of the little grape baskets heaped to five cents for a quart basket full, the man offering the former selling a crate for 65 cents, 10 cents being charged if the box was taken away. They were lovely, big round tomatoes without a spot, and the crowd was about three deep around them; the man and his helper were working just as fast as they could go. This was equally true of the other good things—wherever the crowd was biggest you could rest assured the stuff was the best for the money.

Cucumbers, small, were 10 cents per dozen; peppers, red and green 10 cents a dozen; corn 20 and 25 cents per dozen; small cauliflowers eight cents; string beans eight cents per quart; potatoes seven pounds for 10 cents. Lima beans five cents a quart basket; cabbage five cents for large and small heads, depending on seller; beets and carrots two bunches (about five in bunch) each for five cents; grapes, small baskets, 10 cents, but there was quite a difference in the amount in each basket; cantaloupes, five to eight cents each; plums 25 to 40 cents a square basket; celery five cents per stalk for large and two stalks for five cents of the small; bacon 25 cents per pound; legs of lamb, 18 cents; ribs of beef 18; eggs 35 to 43 cents per dozen. The lowest of the above mentioned prices on vegetables are just about half the regular store prices, and on fruit about two-thirds the regular price. If country housekeepers had to go just once to one of these markets to buy, they would realize how fortunate they are to be able to go out into their own garden and pick fresh vegetables in abundance, and they can have chickens and fresh eggs whenever they want to, while the city housekeeper who is at all practical (outside of really wealthy people) can only afford to have chicken on state occasions; for four or five pounds of chickens do not go as far as the same quantity of beef, lamb or pork.

THE COUNTRY WOMAN'S CHANCE.—Now it certainly seems to me that here is a chance for the women near these markets to make some money, for no matter how much or how little of any one product you may have you can sell it. If a great many more chickens were raised and the price lowered so that they would be the cheapest meat it would be good for both parties. Everbody is fond of apple jelly, spiced or plain, and this year when apples are so plentiful even though sugar is a little high it seems as though there ought to be good money in it. Homemade pies, cakes, doughnuts or crullers, plum pudding, conserves, pickles, relishes, —also I think cottage cheese could all be disposed of *provided* they were packed and handled in a sanitary way. Assuredly it will not be the woman's fault if the markets are not a success, for on Saturday there were women there of all classes, except possibly the very wealthy, although quite a good many expensive autos were there with large baskets of fruit and vegetables in the back. It is up to the farmers who live near enough to reach these markets to capture more than a 35-cent dollar by offering good goods at moderate prices.

MRS. T.

The Wild Flower Collector.

LISTING PLANTS.—The country girl who has decided to engage in the business of wild flower collecting must first make out a list of all the available plants in her locality. This list is the basis of all her future operations, for if she have rare and valuable species her list will "take" at once with the dealer. Every dealer has his price, which varies but little from any other dealer's price. Send for his price list and if you have plants plentiful enough you can underbid the other collectors and thus get the lion's share of the orders. The list that you send in to the dealer must give price per 10, 100, 1,000, and tell when the plants are ripe and ready to dig. Right here you will see that you must be very well acquainted with the habits of every flower on your list, otherwise you cannot furnish this information and must put in a whole year studying these things before you are ready for work. Of course if you are working for a near-by nurseryman it will be different, for he knows the blooming season of the plants in that locality. The dealer has to be well informed about the blooming time in different localities, too. If he is late getting his collectors lined up for work on a certain item he will be short on that particular species when he comes to filling the orders.

COLLECTING AND STORING.—You can see what it means to be forehanded in this business—that is, to dig the plants at the proper time and store them away ready for the order that is likely to come. There is nothing that gives a collector greater satisfaction than to receive an order for, say 2,000 Spring beauties, after they are all "out of sight," and be able to write the dealer that he has that number stored in his cellar. One of the first aids to this business is a cool moist cellar; in fact it is positively necessary. As fast as you gather the plants place them carefully in the cellar till you have enough to fill an order. When starting out to work provide yourself with a basket that will accommodate the length of the plants, if they are to be sent in bloom; otherwise cut off the stems immediately and drop the roots in the basket.

CONDITION OF STOCK.—Of late customers are demanding that all stock be matured before digging. This is all right. The packing is much simpler and more speedily done, the postage is less and there is a better chance of growing if the shipment is for long distance. Many people say they never lose a plant when dug at blooming time and transplanted in their wild gardens. There is no doubt of that, but suppose the plants must make a long journey in the fierce heat of Summer; even though well packed they have not the chance they would have were they matured and dormant. This necessarily means that you mark the beds of each kind of flower—a most tedious operation sometimes—or keep them in cultivated beds. The latter is by all means the best, not only for you but for the plants. You would say I was first cousin to Ananias if I were to tell you how wonderfully the wild flowers thrive under good cultivation. Anne McCall, in July Woman's Home Companion, tells her childish experience in cultivating the common blue violet. You will strike a responsive chord in the heart of every flower by giving it kind treatment, i.e., protecting it from the "wild beasts" of the plant world and giving it good rich victuals.

PACKING FOR SHIPMENT.—When packing for shipment use a stout pasteboard box well lined with wax paper, with damp moss scattered over the bottom. Pack the roots in carefully and compactly, cover with more moss, fold the ends of the wax paper over smoothly, put on the label giving name and number. Then put on lid and tie *securely*, and lastly wrap in strong paper and tie again. This is the safest way. Write name and address on a piece of white paper and paste in position. Put your name and address in upper left corner. Keep a bottle of library paste on hand. The dealer will supply you with wooden labels and tags. Send by parcel post, and be sure to fill all the requirements. If you are shipping plants in bloom or plants with tops on, divide them into bunches of 10 (if not too large) mass the roots well, wrap tightly in wax paper, then in tough brown paper and tie *securely* just above the roots, leaving the tops exposed. A small bundle can be rolled in pasteboard with both ends open, but long enough to protect the plants. All growing plants must be so packed that the tops have air and the roots are kept moist. This is the reason for tieing tightly above the roots. You must prevent the moisture escaping from the moss. When shipping growing ferns they are to be treated the same way, literally planting them in a shallow box as tightly as they can be packed and crating the upper part of box to allow free circulation of air. For long distance shipment soak the moss overnight, wring out rather tightly and use liberally, making sure that every root is in a veritable nest of moss. Then be just as careful about the wrapping; use double sheets of wax paper, and see to it that every bundle is so wrapped and tied as to be really airtight. These bundles can be placed in pasteboard boxes, well lined with wax paper, and crushed newspaper can be tucked in here and there to hold the tops firmly and prevent injury to leaves and flowers. When shipping dormant ferns cut off the tops, pack the roots in a strong wooden box, or barrel, well lined with newspaper. Scatter some damp moss over the bottom, pack the roots in very closely, with a little damp moss over them, put in label with name and number, cover well with newspaper and nail on cover. With very small brush, paint on name and address. You can do this with a pointed piece of cork and ink.

BUSINESS DETAILS.—The dealer always returns the "carriage fare," so when you send in the bill let the postage or freight be included. If sending by express it is just as well to have them billed "collect." When you receive the check the bill will come with it for receipting. Write the words, "Received payment." on it, and return it to him for filing. When writing to a dealer always remember that time is money in every office, and make your letters as brief and to the point as possible. If he has any special pet way of doing things do them his way. This is one way of pleasing him. Then some day, when sending you an order, he will take time to say: "We like to do business with you."

IDA M. JACKSON.

"DOES your dog love you, little boy?" "Well, I guess he loves me, mister. He knows I'd lick him if he didn't."—Judge.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

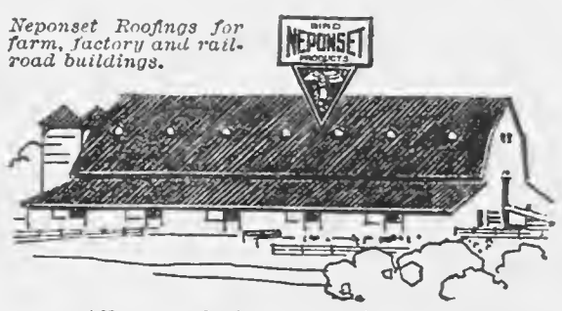
Are You Going to Build?

□ You Spend a Post Stamp □
We'll Save You Dollars

Perhaps you are going to reshingle, finish off another room or make repairs for Winter.

Write us fully today about the nature of your building or repairs. Our twenty-five years' experience with building materials and methods can probably show you how to save money, whether you use our products or not. Whether residence, barn, factory, garage or poultry house, our building experts will gladly give you advice and information. The service is free.

Neponset Roofings for farm, factory and railroad buildings.



All we ask in return is permission to submit samples of our Neponset Roofings, Spark-proof Shingles, Wall Board, Waterproof Building Papers. You are under no obligation to use them, but you may find them exactly suited to your needs.

Since Neponset Roofings were first made, hundreds of roofings have come and gone. Neponset Roofings' increasing and enormous sale is due to one thing—they have made good for 25 years. Records like these: "Not a leak in 13 years; One roofing taken up after giving 8 years of the best kind of service and relaid a *second* time" reveal the proof of Neponset Roofings' long wear. Better *dollar-for-dollar* roofings are not made than

NEPONSET
ROOFINGS

The double-width Neponset Shingles—spark-proof, attractive, permanent, non-splitting and non-curling. Neponset Proslate, a colored ready roofing for bungalows, etc.; Neponset Paroid, the standard prepared roofing for farm, factory and railroad buildings, etc.

Building Advice, Samples and Booklets FREE

We have thousands of dealers, but if you don't know one, write us.

For $3 we will send prepaid this pretty Neponset Doll House. Equal to any $10 house. If you don't think so, you may return it at our expense and get your money back. This price is possible because the house is so effective an advertisement. Strong and durable, 19 inches high and 30 inches long.

JUST the thing for preserving files of The Rural New-Yorker. Durable and cheap. Sent postpaid for 25 cents.

The Rural New-Yorker,
333 W. 30th St., N. Y. City.

Publisher's Desk

I AM enclosing you some papers from the International Stock Food Company of Minneapolis, Minn. I purchased some stock food from the above named company some three years ago, and we were to be the judge of it whether it was a benefit or not. We wrote them about it, saying we could see no benefit to the stock. We had on hand one pail of their stock food, and we offered to return it to them. They said for us to continue using it, and did so, and they extended our time. Ever since we used it they have sent us dunning letters, and there are several others here who are in the same boat as I. T. E.

The papers referred to by this subscriber included the blank contract which he signed when ordering the feed. The order blank signed by T. E. which constituted the contract read as follows:

Please ship me at once by freight, 100 pounds of International Stock Food Tonic, in four 25-pound pails, on your four *months' free trial offer*—with one 25-pound pail extra and absolutely free. Also send me absolutely free, Premium No.....I am to have the privilege of using the entire shipment for my stock. If I am perfectly satisfied with my four months' free trial results, then I am to remit the regular price, of $14, for the 100 pounds, in four months, or write you, asking an extension of time. You are also to send me extra and free, enough International Poultry Food Tonic—your remarkable preparation to double egg production, and International Pheno, the dependable disinfectant and germicide that helps save hogs from the terrible hog cholera—to pay all freight charges on my entire shipment.

A SPECIAL AGREEMENT IN MY ACCEPTANCE, is that if I am satisfied and it is not convenient for me to remit in FOUR MONTHS, that I am to have an EXTENSION OF TIME, beyond this if I write you and request it. If I am not satisfied, it will NOT cost me a cent for the entire 125 pounds or for the valuable free premium. ALL WILL BE FREE.

It is a part of my order that if I have not received paying results, after my four months' usings test, ON MY OWN STOCK, I am NOT to pay you a cent for the four 25-pound pails of International Stock Food Tonic or for the premium I select, and you are to accept my own personal written letter, which I agree to write you in specified details as to results I obtained in my four months' free using test. In my written letter I hereby agree to tell you how I used it and for how long a time, how many times per day, what size amounts I used for each animal, for what kind of stock, for how many head of stock, for what purpose and what results I obtained, and you are to accept my written statement as final and CREDIT ME IN FULL.

Now the above contract appears on the face of it so fair and liberal that it is inconceivable that any business concern would attempt to force collection for the goods after the customer had reported unfavorably from the use of the stock food as T. E. alleges he did. Notwithstanding the contract, however, and the unfavorable report from the use of the stock food, the International Stock Food Company has written the subscriber several letters demanding payment, and finally placed the claim in the hands of collection agencies, who are threatening to bring suit to recover the price of the goods and to report the farmer as unworthy of credit. The International Stock Food Company and their attorneys realize well enough that no court would render a verdict in their favor under the terms of the above contract, provided the customer complied with the conditions as T. E. claims to have done.

During the month of September, 1913, I shipped the Richmond Produce Company of Richmond, Va., two consignments of apples. They sent return for the first lot, but have not returned for the second lot. Will you try to get a settlement from this firm? R. D. C.
Virginia.

In response to our first request the Richmond Produce Company promised to adjust the matter in a few days, claiming delay was due to the fact that the fruit was green and they held it, but it began to decay very rapidly; at the same time they hoped to allow the shipper a fair price. The returns were then four or five months overdue. Green apples are hardly held so long. But no returns of any kind have as yet been received.

Your check in payment of my Canadian Express Company claim received and I wish to express my thanks for the interest you took in looking after it. I had tried for a long time to get the claim adjusted but could do nothing with them. It is a good thing that some one will champion the cause of those who are helpless in such matters as this. I have been a reader of THE R. N.-Y. for a good many years and think I shall continue.
Michigan. E. P.

This refers to a tub of butter, valued at $4.95, which was lost in transit March 13, 1912. We received the remittance for the claim on August 12, 1914.

William H. Cooper, a former vice-president of the Siegel-Cooper Company and head of the bankrupt New York Central Realty Company, convicted after a long trial of using the mails to defraud investors to the amount of $460,000 in the stock of the realty company, was sentenced yesterday by Judge Grubb, in the Federal District Court, to serve three years in the penitentiary at Atlanta, Ga. After passing judgment Judge Grubb, on motion of Cooper's lawyer, stayed the sentence pending an appeal. Cooper was released on a bond of $25,000.—Daily Press.

Penitentiary sentences to a few more real estate operators of this sort ought to have a discouraging effect on their kind. The publicity given the trial and conviction will undoubtedly act as a warning to those who may be tempted to put their savings into such schemes in the future.

I am putting out the samples sent me wherever there might be a chance for a new subscriber. I have done this before, and am ready at any time to testify to the worth of THE R. N.-Y., and the service it has done me in advice, and the collection of the Old Dominion Steamship Co. claim. If this has resulted, or eventually results, in new subscribers, I do not wish any premium or other reward. That incentive is not needed. I give out the subscription envelopes wherever there might be a chance for results. Please understand that while I am not working for any premium and will not accept any, I overlook no occasion to give you a hearty boost, and this with the idea of helping other farmers to a good friend.
Virginia. E. P. L.

If the above were an isolated sentiment it would not be significant or important. But it is not an isolated expression. It is the expression of a very general sentiment among our friends. He instances one service. The Old Dominion Steamship Company, received his perishable products when it was not in position to handle them because of an accident to a boat. The shipper lost his goods. The company refused him any adjustment. They first refused us; but we finally induced them to adjust the claim. At that the shipper did not get more than 50 per cent. of the loss. This incident alone would not influence a man of this type to canvass his neighbors for subscriptions any more than his influence in his neighborhood could induce the paper to attempt the collection of his claim. The men who do this work are impelled by a sense of coöperation, and an impulse to support a service to agricultural interests without regard of personal benefits. Without such a spirit, a paper like THE R. N.-Y. could not exist. That spirit has doubled the circulation of the paper three times in less than 20 years. The publishers and editors direct its forces; but it is the farmers themselves who furnish the energy that makes it powerful to champion their cause.

My wife gave a photograph of her deceased mother to an agent of the Colonial Art Company, Utica, N. Y., who called here with the understanding that he would make an enlarged picture for $1.15 and return the original photograph. She gave him 50 cents, and the balance was to be paid when the picture was delivered. Now they refuse to deliver the picture or return the photograph, until we pay $2 or more for a frame, which we refuse to do. He has worked the same scheme on many others around here, and some have paid as high as $14 before they could get the pictures. Can you get the original photograph back for us? T. W.
Greene County, N. Y.

It is doubtful if we can get the photograph returned, or anything else; but we will try. Twenty-five years ago fake picture concerns were numerous, and complaints were frequent. We are having a renewal of the complaints from various sources now. The general plan is to get the photograph of some deceased relative, usually the only one in existence, and with it an order for the enlarged picture at a trifling cost. They then refuse to deliver picture or return the photograph until you buy a cheap frame and pay a big price for it. The sentimental value attached to the photograph often induces relatives to pay what is demanded rather than lose it. This the concerns well know and they make the most of it. The only protection is to refuse to have anything to do with them.

Tenant's Right to Crop.

I HAVE received notice to vacate the premises that I now occupy by the first of next month. I have lived here 13 months, and my rent is paid monthly in advance. I have gone to some expense and considerable hard labor to get in a fair-sized garden, which is just now beginning to yield. It will be all of two months before I can clean it all up. Must I go and leave the garden (and I would hate to destroy it), or can I still claim the produce from it, or transfer the same to some other party not a tenant of the premises, should I move? How soon must I leave the place? Have I a certain length of time to vacate, or must I take the landlord's stated time? I have not spoken with the landlord as yet. He is not the owner of the property, only the agent. Has he all the power to evict of the owner? J. T. S.
Massachusetts.

Your rights would depend upon the terms of a written lease, if there is one; failing that, the landlord should give you at least one month's notice to quit. The general proposition is that the tenant should be, and is, entitled to emblements (the growth out of the earth produced annually by labor and industry, such as beans, corn, potatoes, etc.) when, without any fault or concurrence on his part, it is unexpectedly ended. Thus, if the lease for a designated number of years provides that either party may terminate it on giving notice and after the tenant has a crop growing, the lessors serve the notice which will expire before the crop can mature, the lessee will be entitled to emblements. In some States there is a custom which retains for a tenant the ownership of the annual crops which he has growing on the land at the time of the termination of his estate. So it would seem, in your case, that if you did not know when your landlord would terminate the lease, you would be entitled to the garden crop and may transfer your interest in it to some other party. You should have an understanding with the landlord or his agent immediately and he will probably recognize your right to the garden crop. The agent usually has all the power to evict possessed by the landlord. M. D.

Concrete Structures Like These Never Need Replacing

They are built to last forever. Their first cost is their last cost; they need no painting, no repairs; are fireproof and ratproof; unaffected by time or weather; as enduring as the granite rock.

You can have such structures on your farm. Whenever you replace a farm building, build an enduring concrete structure. Whenever you add anything new to your farm group, make it a concrete improvement. Always use the best materials in their construction. Be sure to ask your dealer for

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending Sept. 18, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914.	1913.
April	$1.40	$1.50
May	1.50	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.10 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.81 and $1.61 for B and C. Hotels and restaurants using two to three cans per day are paying five to 5½ cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

Business has been on a moderate scale during the week, without much pressure to sell, except on the lower grades. Packing stock and city made are very dull.

Creamery, extra, lb	32	@	32½
Good to Choice	26	@	30
Lower Grades	22	@	25
State Dairy, best	29	@	30
Common to Good	20	@	23
Factory	21	@	23
Packing Stock	19	@	22

Elgin, Ill., butter market 30½ cents.
Philadelphia, western creamery, 32 cents.

CHEESE.

The market is one-fourth cent lower on nearby grades and trade quiet, with considerable stock going into storage.

Whole Milk, fresh, specials	15½	@	15¾
Average fancy	15	@	15¼
Prime	14½	@	14¾
Under grades	11	@	14
Daisies	16	@	16¼
Skims, specials	13	@	14
Good to choice	11½	@	12½
Poor to fair	7	@	11

EGGS.

Business is unsettled. Receipts are quite heavy, but running medium or below in quality, very few being good enough to meet the top quotations.

White, choice to fancy, large	38	@	40
Common to good	30	@	35
Mixed colors, best	32	@	33
Common to good	22	@	25
Western fresh, white	26	@	32
Lower grades	18	@	20
Storage, best	24	@	25
Lower grades	20	@	24

FRESH FRUITS.

Apple prices on the better grades of picked fruit have improved. Pears are with a large proportion bruised or small. top qualities. Peaches are still very low, with a large proportion bruised on small. Grape market dull and lower. Cranberry quotations are low because of the poor quality of the receipts.

BUFFALO MARKETS.

POTATOES, which retailed for $1 a bushel last month, are down to 90 cents and not quoted above 80 cents wholesale. Beans remain high, on account of the partial failure of the crop, quotations to retailers being $4.25 for marrows and $3 for pea beans. Cabbage and onions are low, cabbage, $2.50 to $3 per 100 heads, and onions, $1 per bushel. Peaches are not above $2 per bushel, and good third-bushel baskets sell at 65 cents, retail. Butter runs as high as 34 cents wholesale and nothing being quoted lower than 22 cents. Cheese has not advanced, the highest regular quotation being 18 cents. Eggs are 26 to 33 cents wholesale. Poultry, 21 to 23 cents for dressed turkey, 15 to 17 cents for live; fowl, 18 to 19 cents for fancy dressed, and 17 to 18 cents live. The apple market is in an uncertain condition, buyers not being able to fix a price they would call safe which will be accepted by farmers. Summer apples are plenty at 30 cents to $1 per bushel, retail. The quality is much better than common. Pears are not a large crop. Bartletts wholesaling at $1.50 per bushel down and Clapp's favorite a little lower. Plums are scarce at 10 to 12 cents per six-pound basket for small blue, to 15 to 18 cents for large green. Home-grown grapes are coming in at 17 to 20 cents for seven-pound basket of blues and a trifle more for other colors. Melons are cheap, watermelons not being quoted above 35 cents wholesale and muskmelons at $1 per bushel. The season has been favorable to the crop. Corn is lower than it has been in some years, being eight cents per dozen, retail, for Golden Bantam and 10 cents for Evergreen. The quality is excellent. Cucumbers are more plenty than common, selling for 25 to 35 cents per bushel, or 15 to 25 cents per 100 for pickles. Cauliflower wholesales at 75 to $1 per bushel. Lettuce wholesales at 15 to 25 cents per dozen and retails at two heads for five cents. Celery is plenty at 40 to 45 cents per dozen for fancy. String beans are 50 cents to $1 per bushel, peppers $1.50 per barrel, tomatoes 35 to 45 cents per half bushel basket. J. C.

Sept. 7. Plenty of rain. Grass looking green; second cutting of clover about completed. Plowing for wheat mostly done; corn about ready for the silos. Potatoes will be a short crop; peaches full crop, selling at 50 cents to $1.25 per bushel. Brood ewes $2.50 to $3.50 per head; not much change in cattle prices. Corn, 90; wheat, $1; potatoes, $1; chickens, 12; hens, 10; butter, 20; eggs, 24. Sugar declining a little; no cause at the present time for it to be so high.
Morgan Co., Ohio. W. B. H.

Cattle most grade Holstein around here; good grades $85 to $115; cattle of other breeds $15-20 less apiece. Butter, creamery, 35, dairy 30; milk shipped to Buffalo, 15 cents a gallon, f.o.b. At ice cream plant price varies from $1.10 per hundred to $2, usually $2 for one month, November. Pears very scarce; selling for $1 per bushel. Apples large crop. No silos made as yet in this section. Wheat $1.10; beans quoted at $3.25. L. J. K.
Akron, N. Y.

We had dry weather until about three weeks ago, since that we had abundance of rain, so much so that it bothered cutting oats. The potatoes are growing nicely, but many of them are rotting. There is a good crop of apples, Bartlett pears are shy, the pear crop is not over half a crop. It is said that in the Keuka belt the grapes are doing nicely. Hay is not an extra crop, but little clover, and there is considerable Alfalfa which is very good. There will be some steers fed for the Buffalo market. There are not many silos, but more will be established than heretofore. T. B. H.
Ontario Co., N. Y.

"WHY would not Jiggs patronize the fortune-teller? Was he afraid to have his future told?" "Oh, no; he said he didn't care what she said about his future, but she threatened also to tell his past."—Buffalo Express.

FARM HANDS WANTED—We always have good places, in Dutchess Co., for men who can milk and do general farm work; wages dependds upon capabilities. The Dutchess Employment Bureau, No. 11 Washington Street, Poughkeepsie, N. Y.

Subscribers' Exchange

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

I WILL EXCHANGE first-class apples for sweet potatoes. L. I. WALDOCK, Cuba, N. Y.

NEW HONEY—Basswood or clover in sixty-pound cans. Write for prices. C. A. HATCH, Richland Center, Wis.

WANTED—Young family cow, giving eighteen quarts 5 per cent. milk, Jersey preferred; give particulars and price delivered. Box 56, Little Falls, N. J.

FOR SALE—Valley farm 190 acres; fine buildings; beautiful location. Address LARSON FARM, Willseyville, N. Y.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—Position as manager or foreman on a first-class fruit farm, 25 years' experience; references furnished. Address W. H. SCHWERK, East Otto, N. Y.

WANTED—By ambitious man, 25 years of age, steady position on farm; have some knowledge; state salary, etc. Address W. E. S., Rural New-Yorker.

YOUNG AMERICAN—Wishes position on country place; experienced about house, garden, horses, poultry, stock; references; state wages. P. R. J., Care R. N.-Y.

MARRIED COUPLE—Want position on farm; can do any work; two children; long experience; best reference; state salary. NESNADNY, Care Dr. Kucher, Rivervale, N. J.

POSITION WANTED—As farmer or herdsman by practical man, life experience with cattle, sanitary dairying, college training, good reference; small family; state wages. Address B. B., care of R. N.-Y.

WANTED—A reliable farm barn foreman by Oct. 1; must understand care of farm horses, repairing harness, and be generally useful; steady position, good wages for right party. Address Box 212, Greenwich, Ct.

FARMER WANTED—Married man as working farm foreman on Long Island milk farm; wages, $50, with house, fuel, vegetables, etc. State age, experience, nationality, size of family. S., Box 171 Saint James, L. I.

TWO STRONG CITY BOYS, aged 18 years, want place on farm for two years to get practical experience preparatory for agricultural college; salary not important. Address ROBT. P. KEHOE, 98 Morningside Ave., New York.

FARMER—Experienced in modern methods of dairying, efficient with purebred cattle, poultry and swine; a very useful, all-round man; married, but could accept good position as single man for a certain length of time. Address BENJ. H. DAVIS, Roslyn, L. I.

HOUSEKEEPER WANTED—Middle-aged woman, accustomed to farm work and butter; able to make and appreciate comfortable Christian home for owner. No objection to child if right sort. References required and given. Address "Housekeeper," care Rural New-Yorker.

WANTED—Steady, energetic young man to take charge of the poultry; must understand the running of incubators and care of young chickens; able to milk and assist in dairy; wages, $35 and board; must have references from similar positions. Apply Supt. Harkness Estate, Waterford, Conn.

POSITION WANTED—As superintendent or manager of a poultry plant, highest references as to ability, thoroughly experienced in modern methods; capable of planning or remodeling a plant on scientific principles, also experienced in general farm and orchard culture. G. H. SOMERS, Long Branch, N. J.

A PRACTICAL, successful farm superintendent desires position on an up-to-date dairy farm; understands producing sanitary milk, also care and breeding of Holstein stock and feeding for A. R. O. records, and can produce results; highest credentials; no liquors. Address N. X. Y., Care Rural New-Yorker.

WANTED—Position as manager of commercial Agricultural Enterprise on large farm to be run on a business basis; scientific knowledge and practical experience in North and South; silos, crops, breeding, feeding; unquestionable evidence of ability and integrity; at liberty Oct. 1, or sooner; will not consider proposition paying less than $1,800; or might consider taking under lease a good farm all furnished. Address B. D., Care R. N.-Y.

FARMER WANTED—Exceptional chance; on shares or percentage of profits, married, small family, on 20-acre Jersey farm, 6-room house, near Philadelphia; berries; 1,000 peach trees, grapes and early garden truck; must furnish horses, harness and wagons. We have all else. Give age, size and age of family; references, experience and all details in first letter or no attention will be given. JAMES R. GWILLIAM, Merchantville, N. J.

DAIRY FARM AND STOCK FOR SALE—One of the best opportunities in the South to-day; write for particulars. L. DILLON, Bedford City, Va. Route 2.

119-ACRE FARM in fertile part of New York. 80 acres in fine tilth; large barns, silo, well with power pump, hotbed, asparagus, fine orchard, strawberries. Large house with plumbing and modern furnace. Fine investment for city family; $9,000 for immediate sale. E. C. G., care R. N.-Y.

FOR SALE—Dairy farm of 214 acres, located one mile from Dryden village, Tompkins Co., N. Y.; farm has two houses, three barns, silo, and other buildings; would take a mortgage for part of the consideration price, if desired. Price $30 per acre. Address owner, Box 356, Groton, Tompkins Co., N. Y.

NEW ENGLAND FARM FOR SALE—To Close Estate—Forty acres cultivated land; eighty acres of pasturage and good apple orchard; high ground; good view; four miles from Atlantic Ocean, in the town of North Stonington, Conn. Modern thirteen-room house and small barn; good water; one and one-half miles from trolley, and near State Road. Address ALLYN L. BROWN, Admr., Norwich, Conn.

FOR SALE—A 209-acre farm, in first-class condition, 8 acres in wood and timber, value $1,000; level fields; one mile to Blooming Glen, mill, stores, etc.; 3 miles to Perkasie, R. R. and trolley, one-half to creamery and school, 30 from Philadelphia; attractive brick house of 12 rooms, slated roof; about 140 apples, pears and cherry and grapes trees, and 100 bearing peach trees; barn and other outbuildings, also in good condition; price, $80 per acre; $4,000 may remain on easy terms; no agents. Address S. A. SCHILSTRA, Perkasie, Pa., R. 3.

CONCRETE BLOCK outfit; mixer, etc., complete. O. REDFIELD, Salisbury, Md.

MILKING MACHINE FOR SALE—Having quit dairying have a Hinman Milker for sale; a bargain. F. E. BROWN, Newfield, N. Y.

TRY the NEW WAY Of Buying By Mail

VOL. LXXIII. No. 4275. NEW YORK, OCTOBER 3, 1914. WEEKLY $1.00 PER YEAR.

SELECTING THE LAYING HEN.

How To Look For Breeders.

A RULE-OF-THUMB METHOD.—In THE R. N.-Y. of August 29 Mr. Leo A. Mapes asks an important question, the answer to which may be of decided help to busy farmers. He writes:

It seems to me that there should be some rule-of-thumb method whereby the busy farmer-poultryman could pick out his best laying hens for breeders. My idea is that there ought to be some characteristic traits and habits of good layers, although it seems to be disproved that there is any uniform physical type. I wish you would submit the following points to some of the observant trap-nest operators, for comparison with their findings according to the records. If anything definite along these lines can be determined, it would be valuable to many of us. I believe that a hen having these traits should be an extra good layer, or, at least, extra profitable.

(1) A hen that lays during Fall and Early Winter. (2) A late molter. (3) One that lays during molt. (4) One that is active and always next to the feed pail. Good eater. (5) Not much given to broodiness. (6) One late to roost.

Likewise, that these traits indicate a poor one:

(1) A poor eater. (2) One lazy and sluggish. (3) A wild one. One that scoots around the farthest corner when you appear. (4) One frequently broody. (5) One not laying in Fall and early Winter. (6) One going early to roost and not coming at the feed call. All of these points with due allowance for the breed and condition at different seasons.

The phrase, "rule-of-thumb," is unfortunate in this connection, as its meaning is somewhat like that of "main strength and stupidness," which my father was apt to apply to certain ways of doing things, and both imply the use of physical strength rather than applying intelligence and common sense. In the handling of such live stock as hens and cows, whose product depends so largely upon right conditions and right foods rightly used, there *must be* intelligence and common sense applied for best results; just simple rule-of-thumb won't do! It needs science

HURRAH! MY SISTERS ARE AHEAD AT THE EGG-LAYING CONTEST! FIG. 519.

RULES OF SELECTION.—There are three methods of selecting the best layers, to be used later as breeders, and the first and best is the intelligent use of the trap-nest all the year around: the trap-nest record is dependable, it is absolutely certain. There is no doubt whatever about the trap-nest being the best method of selecting the greatest layers. The second method is to use the trap-nest for six or seven months of Fall and Winter, and that use of the trap-nest for the first half of the poultry year gives us a pretty good showing of a hen's laying ability. This point wasn't given due consideration when the question was put up to Mr. Barron at Storrs. Mr. Barron is so thorough himself, in his trap nesting and leg-banding, that any half-way measures don't appeal to him. The question had to be repeated in order to get his consideration, and when repeated he hesitatingly answered. "Why, of course, a six-months' trap-nesting is better than not trap-nesting at all, but the whole year's record is so much better, is so much safer. No, I wouldn't advise the six-months' trap-nesting!"

TRAP-NESTING SIX MONTHS.—That means that he did not give the question consideration from the busy farmer-poultry man's standpoint; he considered it solely from the standpoint of the poultryman. Now, there are very good reasons why a six-months' trap-nesting is decidedly helpful in selecting the great layers for future breeders. The birds which are the great layers are certain to be late Fall and Winter layers, and it is equally certain that the birds which are not late Fall and Winter layers are not great layers at all, hence the six or seven months' use of the trap-nest pretty well tells us which birds to select for breeders. So true is it that the great layers are cer

tain to be late Fall and Winter layers that I long ago adopted the slogan: "Take care to get eggs in late Fall and Winter, and the rest of the year can safely be left to take care of itself." This is a paraphrase of the familiar saying: "Take care of the cents and the dollars will take care of themselves"; and both sayings are eminently true.

ADVANTAGE OF THE PLAN.—A great advantage of the six or seven months' trap-nesting is that it exactly fits the busy farmer-poultryman's need. The five extra-busy months on the farm are May, June, July, August and September, and those are the months in which trap-nesting can best be foregone: the other seven months the farmer-poultryman can find the half-hours four or five times a day to give to the trap-nests and keeping the records, and great will be his reward. We urge the use of trap-nests for seven months instead of six months, because it is essential to the best late Fall and Winter egg yield that the birds come to laying maturity early in October, and they will then be in fairly full lay in November and December. It is the November and December eggs that fetch the greatest prices, so that the best profit comes from those eggs, but the vital point is that if the birds do not come to maturity until later they are overtaken by the cold weather, are slow in beginning to lay and do not get into the full flood of laying until well towards Spring! Just here the egg-contest people have slipped a cog, in that they do not have the contests begin until November first; the contests should begin October first, then they would be really valuable. True, that would throw out the birds of people who hatch their chicks so late that their pullets do not come to laying maturity till late Fall or Winter. Never mind that! What the contests should teach is the method of making the best profit from egg production, and that method unquestionably is to have the chicks hatched out sufficiently early that the pullets may be brought to laying maturity early in October, and then kept steadily laying. That is the keynote to profitable egg production, as was strongly emphasized by Mr. Barron at Storrs.

A THIRD METHOD.—The third method of selecting the best layers for breeders would be the examining of each bird, as Mr. Barron demonstrated to us. This examination would tell us the *probably* good layers. Mr. Barron's method of selecting was much like the examination a score-card judge gives to birds he is judging. It is noteworthy that Mr. Barron gives little importance to the familiar pelvic-bone method of determining a good layer, although he does estimate the probable time of a bird's beginning to lay by the position of the pelvic bones. His method might not apply to all pullets, and the evident bodily maturity of a bird would need to be considered. We need to keep in mind the fact that Mr. Barron is used to estimating pullets that have been bred for egg production for many generations, and have *the laying habit bred into them*, and such birds could be depended upon to lay at once they have reached maturity. With such pullets the pelvic bones being one finger's width apart, indicates that the bird will lay in about six weeks' time, two fingers' width apart indicates that she will lay in about four weeks, three fingers' width apart indicates that she will lay directly, if not already laying; and that is all the importance that he gives to these bones.

LAYING POINTS.—In taking a bird in his hands to examine her the first attention was given to the head and comb. The head should be full and broad, the beak should be short and stout, the eye should be full, clear and bright, and the comb should be of fine texture; it should be soft, smooth and fine to the touch, not feel coarse and hard. The back should have good breadth and be long; the great layers are long-bodied. The breast should be full, round and deep. There should be good width between the legs, to allow plenty of room for the digestive organs, and the rear part of the body should be full (but not "baggy"), and the general shape of the bird should be of good size, not small and thin; there must be "a good understanding" for the active, vigorous, great-laying bird. Mr. Barron desired to see the birds on the ground and walking around, so that he could better estimate their appearance: an erect carriage, and the look of being "up-to-and-good-for-anything" is essential. And the great-laying hen, he said, "will not be clean and tidy looking; she will be rather dirty looking, and ragged, and her shanks will be white—not yellow!"

WHEN TO JUDGE.—These points would be decidedly helpful to the busy farmer-poultryman in selecting his best layers for breeders, but they should be applied in late Fall and Winter, not in the early Spring, when *all* the birds are laying if they have any lay in them! These points are not much like those Mr. Mapes suggests, but they would be much easier to apply. I confess to being puzzled as to how Mr. Mapes would apply his points: how mark (or catch for leg-banding) the birds he notes as having the desired points. Apparently he would depend upon glancing at the birds as he is with them in the pen. No, Mr. Mapes, I think your rule-of-thumb method of selecting the best layers to be used for breeders won't do! It would be better than not selecting at all, would be better than the hit-or-miss breeding followed by the great majority of farmer-poultrymen, but when a really good selection can be made by going a step farther, why not take that added step? A. F. HUNTER.

WHEN TO KILL BRUSH.

I AM told that there are two months late in the season (August and November, I believe), when, if brush is cut off, it will not sprout or grow. Farmers cut in the dormant season to prevent regrowth. Is this method reliable? W. W.
Litchfield, Conn.

The best time to cut brush and small trees in clearing a field is during August and September, or before cold weather fully sets in. Many farmers will tell you that this is due to certain changes in the moon, but the moon has little if anything to do with it. You attack the brush at this season for much the same reason that you would from choice tackle a good-sized man when he was completely tired out, rather than wait until he was thoroughly rested and had just had a good-sized meal. The shrubs and

FOUR MONTHS' GROWTH OF APPLE GRAFT. FIG. 520.

trees grow fast during the Summer. A great deal of this growth comes directly from the large, fleshy roots, which feed the plant somewhat like the roots of the asparagus plants. At the close of the season these shrubs and trees stop growing, and their roots are well nigh exhausted by the growth they have made through the Summer. The plant then, if left to itself, will make no further growth above ground, but spends the rest of the season in replenishing its root system, storing up the food and energy for next year's growth. Now if the plant is cut off above ground while in this weakened condition at the end of the season, nature drives it into making a new growth to repair the damage; thus instead of refitting and strengthening the root system, these shrubs or trees proceed to send up a new growth above ground. It will be weak and feeble, as the roots are exhausted, but it leaves the root without power to strengthen itself, and the chances are that it will die through the Winter, or come out in the Spring badly exhausted. This is the theory upon which the destruction of brush is based. Trying to kill out the brush in Spring or Summer makes a very much harder job, because then such cutting acts like pruning a tree during the growing season, as this drives it into extra growth.

The best tool that we have found for chopping up such brush land, after it has been cut over in this way, is a disk plow, which is a large disk, either plain or with cutaway edges, mounted on wheels, so that it can be put down into the soil for a reasonable depth. This works better than a plow, as it chops and turns the roots over, while the plow catches under them and is often unable to break them off.

MODIFIED CULTURE FOR ORCHARDS.

LEARNING from Dr. Bailey's book on "Fruit Culture" that the roots of pear trees extend much farther than the branches, would it be a good way to plow, cultivate, fertilize or sow a cover crop in the center of the space between the rows, leaving sod next to the trees, this sod to be cut and used as mulch around the trees? S. E. T.
Cornwall, N. Y.

We follow this plan with most of our own orchards. A strip five or six feet wide is left unplowed along the rows of trees, while the middles or centers are plowed north and south one year and east and west the next. In young orchards we grow a variety of flint corn in these centers, using a small quantity of fertilizer, and sowing a cover crop at the last cultivation of the corn. This cover crop is left to grow until the early part of May, and then plowed under, repeating the plan of planting the corn. This has given us a good orchard, while the corn practically pays the expense of cultivation and fertilizing. If it was not your desire to raise corn or other crops, these cultivated middles should be kept thoroughly harrowed through the season and a cover crop put on in August. This crop should be plowed under thoroughly the next year, and the operation repeated. The plan is a sensible one in many localities, and has given us good results. There are a number of modifications which can be worked out.

FOUR MONTHS' GROWTH OF APPLE GRAFT

A LIVELY GRAFT.—We often have reports showing remarkable growth of grafted fruits. The picture at Fig. 520, shows what came from an apple scion in about 16 weeks. Mr. John N. Emery sends us this note about it:

"The scion was Fall Pippin; the tree was Summer Transparent of very vigorous growth. The graft was made about the 15th of May, and the actual time was about sixteen weeks when photographed. The owner, who appears in the picture, is Mr. E. B. Dunkerton, of Syracuse. When photographed the graft was three feet, three inches in length."

FRUITS IN CENTRAL NEW YORK.

OUR representative recently ran upon Grant Hitchings, of Onondaga Co., N. Y. Mr. Hitchings would hardly like to be called an "Apple king," but he has travelled the royal road to success. This is the way he talks:

"If you are to command the best prices for an article, that article must be good. If you wish to destroy the appetite of customers for a product, just mix in a few culls in your package, and you will see the popularity of your brand slip away. Do anything with your No. 3 and No. 4 fruit and your culls, but don't sell them under your own label for good fruit, don't sell them at all, let them go to the cider mill, to the hogyard or anywhere, but don't hurt the business of growing and marketing good fruit by shattering the confidence of buyers with an inferior article sandwiched in with attractive fruit. There are men who are growing high-grade goods for the market: these men are in a class by themselves. People are becoming acquainted with their quality as the people are becoming acquainted with the high-grade article of merchandise. The good buyers are calling for the products of these growers, and they will not be satisfied without their fruit. These producers who appeal and hold the high-class trade have good varieties, produce good fruit, and high quality.

"I would advise succession in fruit, as follows: Red Astrachan, Williams Favorite, Oldenburg, Gravenstein, Wealthy, Twenty Ounce, King, McIntosh, Northern Spy, Rhode Island Greening, Rome Beauty, and if you want any more plant McIntosh. There is no limit to its demand. The more of these which are grown the better will be the appetite of the consumer. These are good yielders, and satisfy the trade. In addition they cover the season from early season. The Spy and McIntosh are good yielders, and the more planted the better.

"The Eastern man is not harmed by the advertising of the Western grower. There are thousands and thousands of orchards coming in bearing. The products of these orchards do not glut the markets of the Middle West and the East: they are stimulating the market, continuing the taste for apples, and have demanded of the Eastern grower the good pack. We must do as the Western grower is doing, educate the customer up to the point that to enjoy good fruit he must pay a good price for it. We must have this price, for there is interest on investment to be figured against our orchards, the cost of maintenance, of fighting insects and scale, the harvesting and marketing of the crop. All this demands that we have good prices. The time has gone by when things just grow, and all that is necessary to secure returns is to pick the fruit and hand it over to the buyer at any price."

FARM EVENERS AND HITCHES.

Planning to Equalize the Draft.

METHODS AND PURPOSES.—Notwithstanding the increased use of the tractor in farming operations, the horse still furnishes the greater part of the tractive force used by the farmer. The evener always furnishes the link between the horse and his load, and a knowledge of its use and adjustments is essential to secure best results. Its purpose is to furnish a flexible hitch, place the horses composing the team so that they can work advantageously, and so to equalize the load that each horse draws his proportionate share. Among the desirable features are strength, lightness, simplicity and shortness of hitch. The evener is governed by a few simple laws which, when once understood, will enable one to devise hitches for a varying number of horses to suit his needs. The evener is a lever and comes under the laws of physics governing the same. This states that the power arm times the power is equal to the weight arm times the weight, expressed by the formula PA X P equals WA X W. The length of the arm is always taken as the perpendicular distance from the line in which the force is acting to the fulcrum or point upon which the lever swings. This law is probably illustrated as well by the seesaw as by any other common object. Every boy knows that to balance two of his companions on the seesaw he must sit just twice as far from the center as they do, provided, of course, that they are all of the same size.

ARRANGEMENT OF HITCH.—Practically every wooden evener has the center hole placed well toward the front and the two end holes placed well back. This is for the purpose of strength and is desirable as it shortens the hitch. However, it has one undesirable feature; it divides the load equally, only so long as the horses remain even. As soon as one goes ahead of the other it lengthens his lever arm as shown by Fig. 523, and gives him the advantage. The mount of advantage secured, of course, depends on the amount that the holes are out of line, and the distance one horse is in advance of the other. If one has a team, one horse of which habitually travels ahead of the other, I would recommend attaching his whiffletree nearer the center to equalize the load when at work. With eveners having a D, or clevis, to which a chain may be attached, the reverse is true: the horse behind has the advantage, for in this case the middle hitch is behind. This, however, adjusts itself, for, as soon as a horse drops behind he gains an advantage over the other and is enabled to catch up. This explains why a team will sometimes work evenly on a chain, that on a tongue are very uneven workers. The usual wagon evener is from 42 to 48 inches in length. Of course, the shorter the evener the greater the advantage gained by the horse going ahead.

EXPLANATION OF DIAGRAM.—Fig. 523 shows an evener 48 inches long over all; the end holes being placed 44 inches apart from center to center. A straight line passing through the centers of the two end holes will pass 3¼ inches back of the center of the middle hole. This is not an unusual condition, in fact many eveners have the holes for the clevis pins more out of line than this. A glance at the diagram will show that if the "nigh" horse travels 12 inches ahead of the other he will have a considerable advantage over his mate. No one would think of working an evenly matched team with one of them "bored up" 1½ inches, yet this is what this condition amounts to. On an evener of this description the end to which the leading horse is attached would have to be shortened approximately 1½ inches to equalize the load when working under these conditions.

DIVIDING THE LOAD.—There is no definite rule for dividing the load between two horses of unequal weight. Different factors enter, such as age, condition, temperament, and muscular development that call for judgment rather than the application of a fixed rule. However, it has been pretty well established that, other things being equal, each horse should draw a portion of the total load equal to a fraction whose numerator is his weight, and denominator the combined weight of the team. For example: suppose a team weighing 2,800 is composed of two horses, one of which weighs 1,300 and the other 1,500. The small horse should draw 1,300-2,800, and the larger one 1,500-2,800.

PLANNING DIVISION OF LABOR.—Referring to our law of the lever we find that the weight times the weight arm is equal to the power times the power arm. By thinking of one horse as the weight and the other as the power it is an easy matter to work out the position of the holes so that the load is equalized. Suppose that we have an evener 44 inches from center to center of the end holes to be adjusted for the above team. Each arm of the evener as it now stands will be 22 inches long (measuring from the center hole out). It is evident that the heavier horse should have the shorter end, therefore we will move the hole in his end of the evener toward the center. To get the proper distance to move it multiply the weight of the small horse by the length of the unaltered end (22x1,300, equals 28,600) and divide this product by the weight of the heavier horse (28,600 divided by 1,500 equals 19.066 inches), practically 19 inches the length of his evener arm, or 3 inches, the distance that his hitch should be moved toward the center. There are other methods of doing this such as moving the center hole or lengthening the end to which the small horse is attached, but this is the most practical.

UNEQUAL EVENERS.—With the advent of gang plows the farmer has many pieces of work requiring the use of three, four and five-horse teams. The three-horse evener is easily solved by dividing the distance between centers of the end holes into three equal parts and placing the hitch at one of these points. The two horses are attached to the short end and the single horse to the long end. The four-horse evener is even more simple as it resolves itself into a large doubletree with the hitch in the middle and two horses attached at each end. The five-horse evener is somewhat more complicated, but can easily be arranged by remembering the laws applied to the two-horse evener when adjusting it.

FIVE-HORSE HITCH.—When the five horses are to be used abreast the main evener is divided into five equal parts between the centers of the end holes and the hitch applied as indicated in the drawing, two of these divisions being on one side and three on the other. A three-horse evener is then attached to the short end and a two-horse to the long. In some work, as plowing with a heavy gang plow, it is not desirable for the five horses to walk abreast: it either necessitates travel on the plowed ground or causes too much side draft. This can be remedied by letting one horse work against the other four, placing two teams tandem on the short end of the main evener. The hitch will then come on the main evener one-fifth of its length from the point where the four horses are attached. A short vertical evener with equal arms at "A" equalizes the load between the two teams in tandem.

QUALITY OF WOOD.—Eveners should be made with their greatest thickness in the direction of the pull. A 2-inch x 4-inch will support a much greater load when on edge than when flat. Second growth hickory, white ash, red elm, oak and long leaf Southern pine are used in evener construction. The woods first named when they can be obtained in clear lengths make the best eveners, and when they contain a portion of sapwood will be stronger if made up with the sap to the back as it usually has greater tensile strength than the heart wood. Close, fine grained, heavy pieces are the strongest. The easiest material to get, however, is the pine, as the local lumber yard is more likely to have a good grade of it on hand. Select a piece that is slash sawed, i. e.: one in which the grain runs across the end diagonally, for greatest strength. Keep eveners and whiffletrees painted or oiled, and they will reward you with extra service. ROBERT H. SMITH.

New York.

ORCHARD QUACK GRASS; TAR PAPER MULCH.

I HAVE just read the interesting article on page 1097, entitled "The Fight With Quack Grass." Mr. Mathews' plan is an excellent one, and probably more efficient than the one I have tried now for the past two years, and found very effective in growing young trees in a small orchard badly infested with quack grass.

A few years ago I planted an orchard on my farm, 25 miles west of Chicago, the orchard consisting of about five acres adjoining a two-acre patch that was so infested with quack grass that I felt that I did not dare to attempt to plant it. Outside of that condition, it was one of the most desirable locations on the farm for an orchard: it was high and dry and rolling, with a gravelly clay loam, north and east exposure, and lay between the edge of my orchard and the highway. I wrote to members of my State Horticultural Society, who I knew to be successful orchardists, also sought the counsel of a member of the Wisconsin Horticultural Society, who has won considerable fame for successfully raising the Wealthy apple. They all said: "Don't do it;" but at last I accepted the challenge of that quack grass field, and three years ago I planted this patch, mostly with Wealthy and Duchess apple trees. A great many of those trees were killed by the awful freeze of 1911 and 1912, which was partly on account of condition of trees as sent by nursery. Then I should not have planted that Fall, as ground was so dry it could not be plowed, but I replanted next Spring and insisted on my tenant planting corn in that field, so he could cultivate both ways, and I kept quack grass away from trees by hoeing about them. They got a fair but not satisfactory growth that first season, so in the Spring of 1912 I hoed about the trees till June 1, and then placed about them a piece of tar paper about three feet square, held this paper down with clods of dirt and left paper there till September 1, when I removed the paper so the trees could get the benefit of the Fall rains. I got a splendid growth

(Continued on next page)

ORCHARD QUACK GRASS; TAR PAPER MULCH.

(*Continued from page 1179.*)

from all the trees when I used the tar paper and the roots of the quack grass had died and were rotten, so that I could raise them up with a hoe. My trees all did so well that I repeated that remedy this year with excellent results, some of my trees making nearly a three-foot growth. Next year I shall place a larger piece of tar paper around them and will continue this until trees are five or six years old, when I shall depend upon cultivation alone, which will insure a cover crop from the quack grass which will grow after I cease cultivation each year.

Wherever quack grass grows, corn and potatoes will do well if given clean cultivation, owing to the fertility from the decaying roots and its value as a mulch. This plan I have suggested may not be practicable for a larger acreage of orchard, but for one or two acres I believe from my experience that it is probably the best method to grow a young orchard, but of course it does not entirely eradicate the quack grass. I would also like to ask Mr. Mathews if there is not some danger in this climate from constantly stirring the ground from now on until freezing and would that not encourage young trees to continue growing too late if we should have a wet Fall, and thereby jeopardize them if next Winter should be unusually severe? I am glad to see the quack grass grow about my trees after Sept. 1, as that takes away moisture and plant food from the trees, and lets them mature for the Winter, besides acts as a cover crop, although not the most desirable one.

Illinois. DR. C. E. GREENFIELD.

Cutting Asparagus Tops.

I HAVE about two acres of Palmetto asparagus. I have always practiced the plan of mowing the stalks off after they turned yellow, and burnt them on the ground. I have recently been told that it was not good to do so, as the water during Winter went down the cut stub to the crown and hurt it. Will you inform me whether this is so? If left till Spring they become very hard, almost like wood. S. G. W.

Staten Island, N. Y.

The idea that mowing off the dying stalks of asparagus in the Fall will injure the crowns by water finding its way to them in Winter is not borne out by facts, but is purely the result of some one's imagination. Mowing off the stalks in the Fall has been a common practice with many growers for many years. If the crowns have ever suffered injury from cause stated it has not been observed by any of the large growers who have always made a practice of cutting the stalks down in the Fall.

What to do with New Clover.

A READER in Southern New York says he has a new seeding of clover this year which has made quite a heavy growth. He wants to know what he can do with it to get the most out of it. Should he clip it and leave the clippings on the ground for a mulch, let it alone just as it is, or turn in the stock for a pasture?

I consider it better to clip a new seeding and leave as a mulch, as injury may result from pasturing by the stock treading upon and pulling the young grass roots before having sufficient roothold to withstand the same. If growth is quite heavy and not clipped, or pastured, injury results from the matted covering of dead material over the grass roots during Winter and Spring. Clip not too closely as soon as possible, in order that a new growth start may be made. L. C. B.

Regarding the question of how one should handle the heavy growth of newly seeded clover will say that I should prefer to turn the stock on it for a short time every day and let them nip it down to a moderate length, but I would by no means allow them to eat it down close. This clover is one of the very best of cattle foods, and is surely worth much more as such than it is for fertilizer. A fraction of the value of the clover spent in stable manure and used as a top-dressing will keep the field in better shape than the dead clover would by rotting on the field. The only objection to feeding down the clover lies in its liability to cause bloat in cattle, so never turn on the cows when it is wet, and then do not leave them in the field until they have stuffed themselves. J. GRANT MORSE.

COMING FARMERS' MEETINGS.

National Apple Day, October 20.

National Dairy Show, Chicago, Ill., October 22-31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein-Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Association, Oct. 27. Official Dairy Instructors' Association, Oct. 27. National Dairy Union, Oct. 28. American Dairy Farmers' Association, Oct. 28. Council of the National Dairy Show, Oct. 28. National Association of Creamery Managers and Owners, Oct. 28. American Jersey Cattle Club, Oct. 28. National Association of Ice Cream Manufacturers, Oct. 28, 29 and 30. International Association of Dairy and Milk Inspectors, Oct. 29. American Guernsey Cattle Club, Oct. 29. Congress of Marketing, Oct. 29. Milk Producers' Association, Oct. 30.

New England Fruit Show in connection with the Rhode Island Fruit Growers' Association annual meeting, in Providence, R. I., November 9, 10, 11 and 12; secretary, A. M. Parmelee, Norwood, R. I.

National Grange, annual meeting, Wilmington, Del., November 11-14.

Maryland Week Exhibition, State Horticultural Society, Maryland Crop Improvement, Dairymen's and Beekeepers' Association, Baltimore, November 16-21.

Annual Show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

Western Connecticut Poultry Association of Danbury, Conn., Inc., nineteenth annual exhibition, Hull's Armory Hall, Danbury, Nov. 26, 27, 28; secretary, Thomas Deans, 39 Hoyt St., Danbury, Conn.

Sept. 22. Grape crop is better than last year, which was very small, perhaps 30% more. The quality is good, and the demand beyond expectations, especially by the sour juice people who secured last year but a small percentage of their usual requirements. Juice factories here will not pay less than $35 for contracted grapes and we look for a price of about $30 on the open market for bulk. Picking has just commenced on the basket trade and they are bringing 14 cents wholesale. Apples here are a big crop, fruit is smaller than usual but good. Size probably occasioned by the drought in the early Summer. Pears are a small crop and not raised extensively in a commercial way. We had no peaches this year for the reason of extremely warm weather in December and January starting the fruit buds which were killed later by cold weather in February and March. First time in the history of the belt, that we have had an utter failure. Tomatoes are raised extensively, are heavily cropped of excellent quality and bring $9 per ton at the canning factory and on the Erie market from 20 to 30 cents per splint basket. Early tomatoes are also raised extensively for the Erie and adjacent markets, selling anywhere from 75 cents per eight-pound basket to 50 cents per splint later in the season. R. C. M.

North East, Pa.

We grow our own Apple, Pear, Peach, Plum, Cherry and Quince Trees right here in our own Nurseries—know that they are sturdy, free from disease, and True to Name. We can quote low prices because we have got the nursery business down to a science. Fall is the time to plant Apple Trees. Write for our catalog and Fall Prices.
Kelly Bros., Wholesale Nurseries, 222 Main St., Dansville, N. Y.
You'll never regret planting Kelly Trees.

GIRDLING FRUIT TREES.

DURING the last few months I have read in THE R. N.-Y., as well as in other papers, advice where apple trees were not bearing to girdle the limbs. I have several Pippins about 18 years of age in a healthy condition, but producing little fruit. I girdled some of the limbs during latter part of June by removing about a quarter of an inch of the bark from some of the limbs of half a dozen trees. At present the leaves on the girdled limbs have a yellowish cast and some have fallen to the ground. The ungirdled limbs are not affected. Would you advise grafting in feeders before Spring or would an application of white lead and raw linseed oil prove beneficial? Do you think limbs will die from present indications? C. B. R.

Crozet, Va.

I note your suggestion of girdling apple trees to bring them to bearing. Why does not such girdling kill the tree? If a mouse did the work the tree would die. Why not when man does it? C. J. F.

Burlington, Vt.

Replying to these two notes from those who are interested in the matter of girdling fruit trees to make them bear, I will say that it should only be done in the most stubborn cases, and then only on apple and pear trees, for peach and all other stone fruit trees would be killed outright. I have repeatedly tried it on apple and pear trees and never with any serious effects, and it did cause them to bear. Of course it is a slight injury, but if done during the flush of the growing season, June being the best time, and the greatest care used to leave the slimy coating of cambium on the wood untouched, there will be nothing but a checking of the flow of sap downward. This is what causes an abnormal development of fruit buds from the retention of the plant food in the rich sap *above* the wound. New bark will form over the peeled surface very soon, and in a year the healing will be quite complete, unless the cambium and wood were injured by the operation. This is always done by mice when they gnaw off the bark, for they go entirely through the cambium, and their work is usually done in Winter, which is a fatal time for the trees.

I wrote to C. B. R. asking him whether new bark had formed over the wounds, and he has replied that it has in part and that "the girdled limbs are looking fine, except one and that has lost most of its foliage. It has but a slight connection of bark." It is probable that there was not the proper care used in removing the bark last June, and the exposed surfaces were marred, and if so that is why the new bark is not completely covering the wound now. The final result of the operation is what we should know about, that is, has it induced the formation of fruit buds on the girdled branches, and will the wounds heal over safely? I do not recommend girdling to any considerable degree, nor is it often needed, and when it is done it should be with intelligence and extreme care.

H. E. VAN DEMAN.

Strawberry Leaf-roller

A MAN in this place is likely to lose his strawberries on account of a little yellow worm. Apparently some kind of insect lays an egg on the leaf and weaves a web around it, and eventually from the pupa the yellow worm hatches out. Can you tell me how to get rid of this pest? I do not think my strawberries have been attacked yet, but probably they soon will be. Practically every one of this man's plants have these worms on them, both old and new beds.

Remsenburg, N. Y. H. L. S.

I judge the insect is the common strawberry leaf-roller or folder. This insect is often destructive to this plant and is sometimes hard to control. Probably the best thing to do is to mow your field of strawberries, if the insects attack it, about as close as you think it will do and then rake up the leaves at once, before they dry, and burn them as soon as they will burn. This grass will destroy all of the caterpillars. Some growers mow their plants and burn them without raking. If you have read the Hope Farm Notes in THE R. N.-Y. you will recall that the writer of these notes mows his strawberry field every season. I do not believe you can effectively poison the pest. It folds the leaves so that you cannot get poison where it will eat it. At the same time, if the pest becomes serious it would be advisable to spray the plants with arsenate of lead at the rate of three pounds to 50 gallons of water to supplement the mowing. G. W. HERRICK.

LEGAL FARM MATTERS.

Private Lighting Plant.

IF I should desire to install an electric light plant on my farm at the brook which runs through the farm (an expert has informed me that there is enough fall for the required power) and should desire to supply my neighbors with light at prices to be fixed by themselves and myself, would I be required to get permission from some officials "higher up" in this State, or could I manage the plant as I desire regardless of other outside opposition? B.

If you supply no more than 10 neighbors and get the permission of the property owners, to whom you sell the light, to cross their land with your wires, you do not need the permission of any official. This is merely a personal enterprise and no one can interfere. If, on the other hand, you incorporate and exercise the privileges of a lighting corporation which is given the power under certain restrictions of condemning land, you would have to comply with all the requirements of law. This being an individual enterprise you cannot cross any person's land without their consent.

Locating Division Fences.

HOW is the law about the section line? My neighbor wants to move the fence on my land about 24 feet. He says that line is not straight. My land was cultivated 40 years ago, and this fence was made about 30 years ago. My land is all cultivated and his land is cultivated about one-fifth and rest is woodland. Can he move the fence? K. V. L.

New York.

The principle that controls in a case like this which is supported by most of the decisions is that if a division fence be wrongly placed by mistake of the parties, there being at the time no dispute and no representation by either to induce the act of the other, neither one is estopped to have it corrected; but when one acts in reliance and on the representation of the other or each upon that of the other, as when for instance the structure is fixed in settlement of a dispute or there is a "practical location" of the boundary in reliance on which one or both make improvement an estoppel arises and each of them may insist against the other that the fence is rightly placed. The rights of your neighbor, however, would depend upon the question of how the present line was established. If it is the result of agreement he cannot move it now and you should take all necessary means to prevent it, and do not let him move the fence anyhow until you are sure of your facts and your rights. M. D.

Tenants and the Lime Question.

WHEN I came into possession of some farms in Delaware I found the following agreement existing between landlord (my father) and tenant. Landlord had one half of all crops—corn, wheat, tomatoes, a four years' rotation, one field corn, two wheat, one clover for one of tenant as pasture. Landlord paid one-half of fertilizer for wheat and corn, and all for tomatoes. Tenant furnished all seed for wheat and half of clover. No lime was used and there were no cover crops; the one-year clover always closely pastured. I concluded, after a few years, that the farms were deteriorating, meaning less income for tenant and landlord. I then talked the situation over with the tenants, and for two years have been making them acquainted with the ideas of THE R. N.-Y. as to the importance of manure saving, the value of cover crops, the necessity of liming, etc. I propose now to revise our rental agreement and shall offer the following: Landlord to pay for half of all fertilizer, tenant same; landlord to furnish half of all seed—corn, wheat, tomato and clover, tenant same. Landlord to pay for half the lime and seed for cover crop, tenant the same, each to have half of all crops. I would like you to consider this last proposition from the tenant's viewpoint, as well as that of the landlord. I am sure tenants will make one of the old, old arguments—that lime is a permanent improver of land, and as the tenant only holds his tenantcy by the year; he is not willing to pay money (for lime) for the benefit of his probable successor. The same for cover crops—perhaps in a less degree. Why should any tenant refuse to pay for half of lime, or cover crop seed, when they willingly pay for commercial fertilizers, and then again if this plan is universally adopted in a neighborhood, would not each one get the benefit of the other's outlay, no matter how frequent the removal? FARMER.

Maryland.

Your proposed change of the rental agreement would seem to be fair to the tenant. The old argument that lime is a permanent improvement of the land has no standing when we realize that there is really no plant food in lime, but that it merely acts on the soil in such a manner that the plant foods already there are made available. With this knowledge, there seems to be no reason why the tenant should not pay half of the cost of the lime, because by the use of lime the plant food already in the soil is used up faster than it otherwise would be and it really is taking substance from the farm and therefore from the owner quicker than it would without the use of lime. M. D.

Sunlight Double Glass Sash are the *Standard* Everywhere

These sash have become the *standard sash*, cutting out half the labor and cost and doubling the net profits of early gardening wherever used. This superior efficiency is due to these facts! The two layers of glass enclose an air space—a transparent blanket—through which the sun's rays pass freely to the beds, carrying heat and light, but through which the cold from without and the stored heat from within pass very slowly.

The result is the elimination of mats and shutters saving half the labor of covering and uncovering. As these extra covers, used on single layer sash, need never be bought or renewed, thus half the expense of hot-bed gardening is saved.

The Sunlight Greenhouse on which the sash are also used is inexpensive, attractive and a highly profitable addition to any garden. See the catalog.

Write today for the Free Catalog and enclose, if you wish it, four cents in stamps for Professor Massey's helpful booklet on the use of cold-frames, hot-beds and small greenhouses.

Sunlight Double Glass Sash Company 924 E. Broadway, Louisville, Kentucky.

I've Knocked Down the Prices to Rock Bottom on RUBBER ROOFING

Yes Sir! I have positively reduced the prices so **very** low that you can't afford to buy elsewhere. No matter what your roofing requirements are—I guarantee to give you **better** quality at **less money** and in **quicker** time than any other house.

I SHIP FROM 7 FACTORIES

at Cincinnati, St. Paul, Kansas City, Scranton, Pittsburgh and San Francisco, from the factory **nearest** your town, consequently **saving** you **time** and **freight charges.** All Roofing is of the same quality and grade and comes in Red and Green slate, Central Galvo, Mica Flint and Gravel surfaced, Rubber.

Send for Big Roofing Book and Free Samples

and be convinced that I can and do **save you money.** Now is the time to get busy—so send today, sure.

TILE DRAINED LAND IS MORE PRODUCTIVE

ROUND TILE

Carries off surplus water. Increases the value of your land. Acres of swampy land reclaimed and made fertile by using JACKSON'S DRAIN TILE. We are producers of Albany Blue Slip Clay, Hollow Brick and Blocks. Dealers in Sewer Pipe, Flue Lining, Fire Brick and Chimney Tops. Send for catalog and prices. **John H. Jackson Tile Co., Inc., 89 Third Ave., Albany, N. Y.**

When You Blast Stumps You Improve the Soil

Explosives used in stump blasting improve the soil's fertility by breaking up the subsoil and freeing plant food. Burning stumps destroys fertility; pulling is hard on men and horses—slow, expensive. Get rid of stumps and boulders and get ready for bumper crops by clearing your idle land with the

Atlas Farm Powder
THE SAFEST EXPLOSIVE
The Original Farm Powder

Sold by dealers near you. Easy to buy, easy to use, and *always* satisfactory, because made especially for farm work. Quick and economical—bore a hole, load it, light the fuse, and the work is *done!* You need no experience.

Use Atlas Farm Powder to break up hard-pan, shale and clay subsoils, making your poor fields give you your best crops. Use it to dig ditches—do a month's work in a day. Use it in planting trees—better than digging by hand.

Mail Coupon for "Better Farming" Book—FREE

You will find our illustrated book, "Better Farming," full of helpful, valuable information. It tells how to get better crops and save money on farm work by using Atlas Farm Powder, the Safest Explosive. Sent free—mail the coupon.

Cutting Alfalfa for Seed.

WILL you give me information in regard to cutting Alfalfa for seed?
Derby, N. Y. C. J. S.

The Alfalfa seed crop should be handled in about the same way as the clover seed crop. The crop should be cut when three-fourths of the pods are brown. If left any longer many of the earliest and best pods are lost. The self-rake reaper is commonly used in cutting the crop, and the self-binder is sometimes used. The crop is gathered from the piles with barley forks and thrown into a header box, or into a hay rack, the bottom of which is covered with heavy duck. It is usually thrashed directly from the load, for the crop should be handled as little as possible. It may be put in small stacks and thrashed later. The regular clover huller is very suitable for Alfalfa seed. It is run at a lower speed than is required for clover seed, because the stems are brittle and are broken up unduly. A grain separator may be used. Three or four bushels to the acre is a fair crop.
R. P. L.

Massachusetts Asparagus Growers.

THE meeting of the Massachusetts Asparagus Growers' Association held at the Concord Experiment Station on September 9 was a very pleasant affair. The main work at present carried on there is breeding of new improved types and trying to discover what fertilizer and cover crop gives the best practical results in place of stable manure, which is considered too expensive in most cases for the average grower to use. Crimson clover and vetch are ideal cover crops to use where possible, but rye is very good also to sow later than the others, and if a growth of six to eight inches is obtained, it is of much benefit as a soil holder through the Winter, and to disk in next Spring. Some present had thought the proper way to dispose of the growth of old tops in the Spring was to cut and burn, but were emphatically informed they were burning up money by this practice, as the soil needs these very much, and to disk them in without any cutting is the way the up-to-date growers do with these.

Careful study of the breeding of this plant has produced an almost, if not quite, rust-proof variety in the Reading Giant, and the Giant Argenteuil is probably second to this in this respect. Either this fact is positive, or else something of another nature has assisted in destroying the rust, as none is present on the grounds or in the growing section about except a single row kept for the purpose of proving the new sorts immune after being associated with and exposed to this rust.

President C. W. Prescott was re-elected, as were also Wilfrid Wheeler, secretary and treasurer, and Frank Wheeler, vice-president. The black and red beetles were discussed: the latter feeds chiefly on the seed, but does some damage to the plants. The black may be controlled by use of arsenate of lead put on in a very fine mist.

Dr. William P. Brooks of Amherst gave a very good talk on fertilizer experiments carried on in the past years. He stated no fertilizer has any effect in any manner in preventing or reducing rust. 300 pounds of nitrate soda is enough to use per acre, any above this amount does not pay in dollars and cents, although a larger amount might not harm the crop. Acid phosphate does not do much good, as 8,000 pounds per acre was produced without any, but by using 300 pounds, costing $1.80, 500 bunches extra were grown, yet any above that amount would not probably give a corresponding gain. Muriate of potash at rate of 2,000 pounds per acre gave a gain of 820 pounds of crop; 300 pounds gave gain of 2,240 pounds per acre, while 400 pounds did not produce as much, showing 300 pounds was enough, and more if used was wasted, at least for that crop.

Prof. Wilkinson of Cornell gave some facts about New York growers and about the markets of the various large cities of his State. He stated that no large plots of 10, 20, and 30 acres are grown there as is the case in this section here, but mostly consist of two to five acres to each grower. They do not have a uniform package or bunch them either; they mostly sell by the dozen and pack in any kind of package, some holding one dozen others several dozen. Their bunches weigh a little over two pounds and have different lengths of stalks in same bunch, and bunches also vary in length. Here bunches are of uniform length and weight, 1¼ pounds being the weight, and the package a bushel box, each holding the same number of bunches. Prof. Norton who has charge of the Concord Station explained very fully the methods of feeding and matters along these lines, and is thoroughly at home on all subjects pertaining to asparagus and its enemies. President Prescott, on whose farm the station is located, is also thoroughly posted on matters of asparagus, and certainly deserves the hearty thanks of all growers for the work he has done and assisted in doing, and also made possible for others, by furnishing a place for them to do it.
A. E. P.

Slitting Bark for Blight.

THE question asked by Walter C. Black, relating to slitting the bark on trees to prevent blight, I notice you have left to wise men for solution. I do not consider myself in that class, but an observation from me I am certain will do no harm. I have kept in mind for many years that there could be no effect without a specific and absolute cause. Now if slitting the bark produces the effect of eliminating blight, then the blight must be caused by the bark around the tree being too tight. If this be true might it not be that the sap flow was obstructed by this pressure, and the end of the twig the furthest from the source of supply would suffer to such an extent that it would die of starvation?
West Virginia. T. F. L.

Treating Wheat for Smut.

Having had many requests for the method of treating seed wheat to prevent the stinking smut disease we print the following advice from a Cornell note:

1. Select as clean seed as possible.
2. Treat seed as follows: (a) Pour into a washtub or other large shallow container, until it is two-thirds full, a solution of formaldehyde made by diluting one pint of standard formaldehyde in 45 gallons of water. (b) Pour seed into tub and stir it thoroughly. (c) As this process is going on skim off all smut balls, chaff, and light kernels that rise to surface. (d) Remove grain and spread it out to dry, after which it is ready to sow.

The loose smut of wheat which destroys the entire head and changes it to a smutty mass cannot be controlled by this treatment.

Tree Surgery.

IS there such a tool made as a "hook gauge" used for removing fungus from heart of decayed apple trees? In cases where *all* rot cannot be removed what is the proper way to proceed? I find some farmers clean out what they can and then fill cavity with cement. It strikes me in such cases the rot will continue. T. R.
Manchester, N. H.

The Ohio Experiment Station has issued a good bulletin on this subject. It will give you much information. After cutting out the decayed wood the cavity is sterilized by washing with an antiseptic.

SELECTING SEED POTATOES.—The South Dakota Experimental Station sums up the principle of selecting good seed as follows: "Seed selection may best be practiced in the field as follows: When digging the potatoes in the Fall, take a bundle of small stakes to the field. When a hill having an exceptional number, say five or more, even sized tubers is found, set a stake to mark it. Let the picker pick up these seed hills first. When a sufficient amount of seed selected in this manner is found the hand digging may be discontinued. The hand digging is really about the only extra work involved in this method of selection. The Ohio Experiment Station has found that this method of selection increases the yield. The South Dakota Station reported in Bulletin No. 140, a gain of 28 per cent. in yield from simple selection of seed tubers and use of resulting large seed pieces.

$930,000 Per Week Paid for Hudson Cars

Motorists are paying—on the average—$930,000 weekly for this new HUDSON Six-40. And they have for weeks. We are building and selling 100 cars per day.

They would buy more if we could build them. On one day in September—when car arrivals were heavy—152 HUDSONS were delivered to users.

Five Times Last Year

We are selling five times as many HUDSONS as we sold at this season last year. Think what that means on an old, famous car like the HUDSON—long a leader of the line. Think what a car this must be—this new model Six-40—to multiply HUDSON popularity by five-fold in one year.

Last year's model was 3,000 cars oversold. In July—when this 1915 model appeared—we trebled the factory output. But on August 1 we were 4,000 cars oversold.

Men waited weeks for this HUDSON Six-40 when other cars were plenty. No other car could please them when they once saw this.

The HUDSON Six-40 now outsells any car in the world with a price above $1,200.

See What Did It

See the car which has made a record unmatched in the annals of this line. You will see a quality car sold at a price which is winning men by the thousands from lower-grade cars. You will see a class car—in many respects the finest car of the day—sold at one-third what class cars used to cost.

You will see how clever designing and costly materials have saved about 1,000 pounds in weight. Yet never was a car more sturdy. You will see a new-type motor which has reduced fuel cost about 30 per cent.

You will see new beauties, new ideas in equipment, new comforts and conveniences. You will see scores of attractions you never saw before.

They are all in this masterpiece of Howard E. Coffin, the great HUDSON designer. This is his finished ideal of a car, and he is counted the final authority. Mr. Coffin has worked for four years on this model, with 47 other HUDSON engineers. Part by part, every detail of the car has been refined to the limit.

This is the acceptable proven type. This lightness, beauty, economy and price are new-day standards which men are demanding. And this quality—our level best—is the least that men who know will take.

Now is the Time

Now is the time to select your new car. Next year's models are out now. You see what the field can offer. And the best touring months are before you. Don't miss them.

This new HUDSON Six-40 is the car you'll want. And the nearest HUDSON dealer will see that you get it promptly.

Hudson dealers are everywhere. New catalog on request.

Six-40 HUDSON $1,550

Potatoes on Old Soil.

WOULD plowing sod land this Fall, sowing Winter rye, then turning it under in the Spring prepare the land for potatoes? We have a moist, rich soil, and all crops have done well this Summer. If this would not answer, would further preparation make it fit for potatoes, or must another crop precede them? H. L. C.

Medway, Mass.

It will depend upon the character of that sod. Old pasture land which has not been plowed for some years usually contains large numbers of grubs and similar insects which might injure the potatoes. It would be a mistake to plant potatoes directly upon such land, as the white grub would give much trouble. Such sod would be better if turned over in the Fall and left through the Winter in rough furrow, so that the air would work through and help to break up the sod. We should prefer therefore to plant corn on such a sod. If the sod is not well stocked with grubs and other insects, the plan you speak of will answer very well, but do it as soon as you can and seed rye. Next Spring plow this rye under and plant the potato seed deep. In our own experience this method of culture has given us better results than any other. It is a mistake to assume that the old sod and the rye will supply all the needs of a good potato crop; 600 pounds or more of a good potato fertilizer should be used for best results.

Vaccination Law.

IS the law compelling vaccination before children can attend school constitutional? What can be done to the parents if they do not have children vaccinated? I know of instances where children have died from vaccination, and but few die from smallpox nowadays. I heard a doctor say that he would as soon care for smallpox as measles. How do they figure this out? They say that if a child comes to school unvaccinated they will send him home, yet if he does not go to school they will compel it. C. I. M.

Yes; the compulsory vaccination law has repeatedly been held constitutional by the courts as a proper exercise of the police powers of the State. The only alternative for those who object to vaccination is to provide such educational facilities for their children as will meet the educational requirements of the State and excuse the children from attendance upon public schools. As a public health officer for many years, the writer has seen much of vaccination and has had a considerable number of smallpox cases under observation I have never personally seen or known of any serious results following vaccination, though I am well aware that lack of cleanliness during, or after, the operation or the use of impure virus might cause trouble. Such accidents are absolutely preventable, however, and cannot be charged against vaccination. So little fear of any accident have I that I have repeatedly vaccinated myself, and would do so again were I exposed to an outbreak of smallpox. The protection afforded by vaccination is a variable one, particularly as to the time that it holds good, but no one who is at all likely to be exposed to this loathsome disease can afford not to avail himself of it. No one with the slightest acquaintance with the history of smallpox and its control by vaccination could fail to recognize the indebtedness of humanity to this method of prevention. It is only because vaccination has placed such a check upon the disease that the present generation knows it only in its present mild form and has largely lost fear of it. The reappearance of a malignant type of smallpox, such as may come at any moment, would quickly banish all opposition to vaccination and cause the world to again recall the untold horrors of the disease in pre-vaccination times. M. B. D.

THE AGRICULTURAL DEPARTMENT at Washington is recommending Sudan grass as a forage crop for the Central Plains and the Southern States. This grass is closely related to the sorghums. It looks something like Johnson grass, but unlike that grass it does not propagate from root-stocks. Thus it will not overrun the entire farm and become a weed like quack grass, as Johnson grass does. It gives several cuttings a year, amounting to a heavy crop. The hay is of about the same quality as Johnson grass or Timothy. It has many advantages where it will do well. It is thought that this Sudan grass will take the place of the millet in many parts of the country, and is said to be worth trying all through the West and South, but it is not likely that it will prove very useful along the upper Atlantic Coast.

THE MAIL BAG.

Harrowing Timothy Sod.

MY farm is in Connecticut. I cut my Timothy late this Summer, a great per cent. of seed had ripened and fell to the ground. If I should harrow over this ground would that help falling seed to re-seed the ground, or would such operation loosen roots of Timothy now standing, causing it to freeze out in Winter? Would I gain anything by such an operation? My ground has a very good stand, but is thinning each year. J. W. R.

We doubt if you would gain much by this harrowing. It might quicken up the old grass a little, but would not hurt it seriously. It is very doubtful if this new seed will thicken the stand of grass. We have not been able to improve such a stand except by breaking up and reseeding. If the stand is still good topdressing in Spring with a good fertilizer would be the most practical way of geting more grass.

Cover Crop for Orchard.

MY young orchard, four years old, has been in raspberries, which I want to take out. Would you advise taking them ont right away to plow and get in shape for rye for cover crop, or would it start too much wood growth on peach trees? The orchard is apple, with peach as fillers. I have not had a crop of peaches yet. There was lots of bloom on them and they set well, but later dried up and dropped off. The trees have grown fast and are large and healthy-looking, the soil is not very rich, I think lacks humus; it is hard and cracked open. I. R.

Columbiana. O.

We should try and get the berry vines out at once and seed to rye and turnips or rape. This crop growing through the Fall will probably offset the effect of cultivation to get the ground ready for seeding.

Yellow Wash for Buildings.

WILL you tell me how to mix a good yellow wash suitable for outhouses on my plantation, which are exposed to a tropical sun? R. B.

Vego Alta, P. R.

For every 20 gallons desired, one bushel good hard burned lime, one gallon raw linseed oil, five pounds common table salt, five pounds (approximately) dry yellow ochre. Put sufficient water into a barrel, add lime slowly, keeping same well stirred, that it does not burn. When lime is boiling well add the ochre, which you have before hand-mixed to a very thin paste in a separate vessel. The amount of ochre will vary according to the depth of color desired. You must govern yourself. When ochre is mixed in, dump in oil; when oil is mixed in, then add salt. The life of this mixture is dependent on the length of time it takes to mix same. The object is to get the color, the oil, and salt, each thoroughly mixed into the lime separately and have all in before the lime stops boiling; then to take a piece of cheese-cloth or wire fly netting and strain wash through into another barrel before it is cold. I know of a barn I helped coat as an apprentice 22 years ago with above mixture and it still wears on the sheltered side. My neighbor next door to me coated his barn last Winter with same mixture, and not a trace remains of it. Just understand what you are to do, and when bubbling time comes, do it. I have used this wash (not always yellow, different colors) 22 years, and never had it go back on me. I have had employees mix same and more often than not, it turns out badly, because they will not attend to business at bubbling time. When adding ochre remember that the wash dries 50% lighter than when wet; make it twice as dark in the barrel as color you desire. A. F. R.

Use of Bromo-Seltzer.

IS Bromo-seltzer, the commonly used remedy for headache, regarded as a habit-forming drug by the medical profession? What are the common effects when used in excess? G. S. T.

Cornwall Bridge, Conn.

An analysis of "Bromo-seltzer," made by the American Medical Association showed it to contain potassium bromide, acetanilid and caffein; none of these drugs are considered habit forming in the usual sense of that phrase but the acetanilid is a heart depressant and in overdose dangerous. Several deaths have been reported from use of this nostrum and it would be well for those using it to assure themselves that they have no inherent weakness of the heart rendering them especially susceptible to drugs of the nature of acetanilid. M. B. D.

Destroying Poison Ivy.

DO you know anything that will kill poison ivy? J. F. R.

East Hartford, Conn.

Grubbing out with the hoe and burning, and frequent cutting of the tops, will exterminate the pest. Free application of hot brine to the tender young growth is destructive to it, but also destroys other vegetation. Concentrated sulphuric acid, a small quantity applied to the crown of each plant destroys it, but is dangerous to use. We are told that some stock browses on it quite freely.

They contain information which will be worth many dollars to you—the truth about sheet metal. They tell why

ARMCO IRON Resists Rust

Every page contains interesting news about one of the most important subjects before you today—how to prevent the loss from rust. By word and by picture these books tell you the big money-saving facts, the real truth, about sheet metal—why you should insist on Armco Iron.

Armco—American Ingot Iron lasts many times longer than ordinary sheet metal, because it is pure iron. Impurities make ordinary sheet metal rust. Armco Iron is purified to the greatest possible extent and every process of manufacture which has a bearing on rust-resistance is subjected to constant care and study. No purer, more rust-resisting iron has ever been manufactured.

"Iron Roofs that Resist Rust" tells all about Armco Roofing, while **"A Journey to Armco Farm"** tells how you can equip your farm—indoors and out—with better sheet metal articles. Some of the articles of American Ingot Iron on Armco Farm are:

Corrugated Roofing, Terne Plate Shingles, Armco Tin Roofing, Range, Water Troughs, Water Tank, Refrigerator, Silo, Stoves and Furnaces, Culverts, Fence Posts, Milk Cans, Page Wire Fencing, Enameled Ware.

The American Rolling Mill Co., Middletown, O.
Licensed Manufacturers under Patents granted International Metal Products Company

The trade mark ARMCO carries the assurance that iron bearing that mark is manufactured by The American Rolling Mill Co. with the skill, intelligence and fidelity associated with its products, and hence can be depended upon to possess in the highest degree the merit claimed for it.

Resolve to have longer-lived sheet metal products. Send for these two valuable books. Clip and mail coupon.

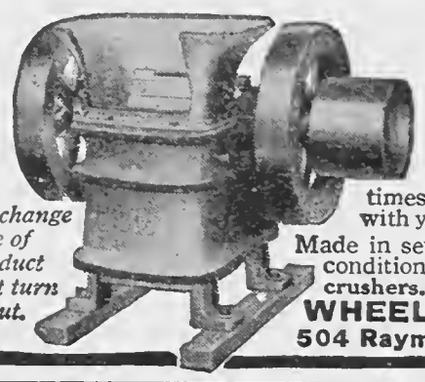
Why buy a crusher that crushes only one size product when you can get a Wheeling which is adjustable to crush any size by simply making a quick adjustment. This makes the Wheeling Limestone Crusher as valuable for road work or concrete as for lime crushing—and you can start small and add capacity as needed—another exclusive Wheeling advantage. Think what it means in added earning power and adaptability to your particular requirements—no big investment at the start.



To change size of product just turn a nut.

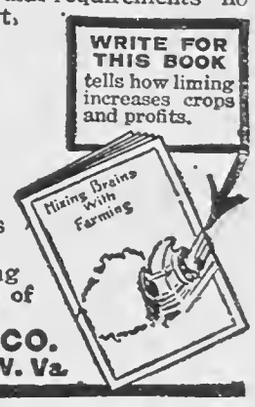
WHEELING LIME STONE CRUSHER

The Wheeling is steel-built—three times stronger than cast iron—lighter—runs with your own power.

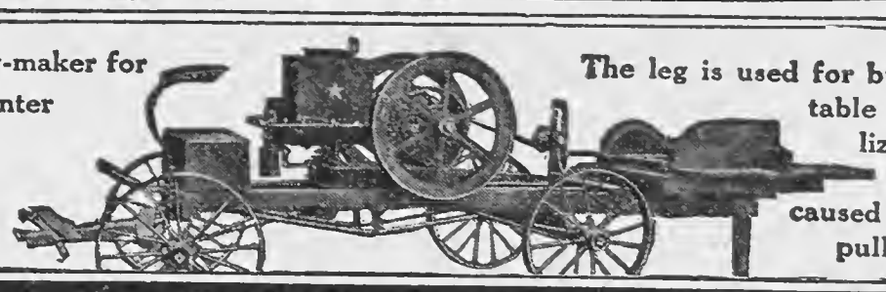
Made in seven different sizes for every crushing condition by the **pioneer manufacturers of crushers.**

WHEELING MOLD & FOUNDRY CO.
504 Raymond Street Wheeling, W. Va.

WRITE FOR THIS BOOK tells how liming increases crops and profits.



A money-maker for fall or winter work



The leg is used for bracing the table to neutralize the vibration caused by engine pull on frame

TESTED SAW MACHINES FOR EVERY REQUIREMENT

Situated in the heart of Vermont, we've studied wood sawing problems at first hand ever since 1840. There's a Gray Saw Machine for every need—and everyone has proved its worth under exacting tests.

Illustration at top of ad shows Gray Attachable Saw Rig mounted with our 5 and 6 H. P. Engine. Rig can be attached to your own truck frame or wagon by home-made supporting frame. Balance wheel provided with drive pulley. Gray Circular Saw Machine with slide table shown at right; extended table allows one person to do sawing At left is Gray Independent Drag Saw Machine with power log feed. Write now for Free Catalog describing these money-making, labor-saving machines.

Money Leaks Out When Paint Scales Off

Every little cracked and scaled place in the paint on a farmer's building is an expense spot. It lets in rain that soaks and rots the wood. It means expensive repairs.

Dutch Boy White Lead

mixed with Dutch Boy linseed oil makes a paint that keeps houses, barns, vehicles, implements, whole-skinned as well as spick and span. It's a standard paint that saves you money. There are low-priced paints that cost less—*at first*—but Dutch Boy and Linseed doesn't crack nor scale; it *does* wear even and slow and smooth, and means less frequent painting to keep buildings *right*. It grips into the pores of wood, defies rain or sun, and rivets on your house an elastic armor that preserves and beautifies it for years. You can mix it with any color.

You can now get red lead in paste form, same as white lead. Doesn't harden in the can. Fine for painting resinous wood; best by all odds for implements and metal work. Ask your dealer.

A Text Book on House Painting FREE

Ask for Farmers' Paint Helps No. 2514

Contains instructions for mixing lead and oil for all surfaces, and all weather conditions; tells which colors look and wear best; helps you to estimate paint required and probable cost.

EVENTS OF THE WEEK.

DOMESTIC.—Justice Joseph Morschauser, in the Supreme Court, has gone on record at Nyack, N. Y., as saying that a farmer does not stand a chance of getting justice in a legal contest in New York City. The justice advises against John J. Thornton transferring his suit against the Nassau Electric Railroad Company from Orange County, where the plaintiff lives, to Kings County, New York City. Thornton asks $2,000 damages for a broken arm suffered by his wife and injuries to himself in an accident in Brooklyn. "If I were a farmer I wouldn't try a case in New York," said the court, "if they gave me a verdict in advance. The farmer does not stand a chance in New York, and I know it. He cannot get square compensation, and you know it." A motion for the plaintiff for a change of venue was therefore denied.

Fourteen persons, including one woman and four children, perished when the Black Diamond collier Lingan rammed and sank the Canadian Government steamer Montmagny, Sept. 18, off the Beaujen banks in the St. Lawrence River, about 26 miles from Quebec. On board the Montmagny were the families of two lighthouse keepers at Belle Isle and Flower Island.

The engineer and conductor of a Philadelphia and Reading Railway train were suffocated and seven passengers were overcome when the train was halted in the middle of a tunnel near Phœnixville, Pa., after running down and killing a woman at the tunnel entrance, Sept. 21. The sudden application of the emergency brakes brought the train to a stop well inside the tunnel, throwing many passengers from their seats. The train crew and several of the men passengers ran forward, but they were met by a wave of gas and smoke, which had accumulated in the tunnel. Three of the men dropped alongside the track and the others returned for help. Later the air became clearer and another advance was made. The engineer and conductor were found dead beside the engine.

September 18 the steam schooner Francis H. Leggett foundered off the Oregon coast with the loss of 72 persons.

The Colorado mine operators have demurred against accepting in its entirety President Wilson's plan for ending the big strike in that State. In this stand the officers of the Colorado Fuel and Iron Company are backed up publicly by John D. Rockefeller, Jr., who is supposed to represent a controlling stock interest in the company. The portions of the plan rejected by the mine operators are regarded here as the vital ones and there is little likelihood of any settlement as the result of President Wilson's suggestions, unless a compromise is reached on the points of difference.

THE EUROPEAN WAR.—The tenth day of the battle of the Aisne, Sept. 22, it was reckoned that the casualties had reached 180,000. The forces engaged were said to number 2,600,000. The Germans were intrenched on the heights, and supplied with heavy guns, with which they bombarded Rheims. The great cathedral, one of the most wonderful examples of Gothic art, and endeared to France by its historic associations, was the special target of the bombardment. Ambassador Jusserand filed a protest with acting Secretary of State Lansing at Washington against the destruction of the cathedral of Rheims, and President Poincare directed a formal protest to be made to all neutral Powers against the destruction of this historic structure. Germany expresses regret, but defends the vandalism as a military necessity. Sept. 23, the eleventh day of the battle of the Aisne, the Allies continued to gain ground; the Germans were still hurling masses against the center. The main battle line from Lassigny to the ridge of the Argonne, 100 miles, is a double row of fortresses, from which Allies and Germans sally in attack and counter attack, while great guns devastate by day and night. East of the Argonne and in the Vosges and Lorraine the French armies are a little more than holding their ground.....Sept. 18 six nuns in a convent at Nancy were mentioned in army orders for devotion with which they nursed 1,000 wounded during the German bombardment which has lasted since August 24.....The senate of Cambridge University has invited the Catholic University of Louvain, Belgium, to move to Cambridge, there to continue its own separate studies, grant degrees and generally to pursue its activities as at its own foundation. Cambridge University would supply the technical facilities for carrying out this work.....The Russians announced, Sept. 22, that they had captured Jaroslav, and were pressing on towards Cracow.....The Turkish government is partially demobilizing its troops and withdrawing them from the frontier. .....The English cruiser Pegasus was destroyed in the harbor at Zanzibar by a German cruiser, and it is said three British merchantmen were destroyed by the German cruiser Emden in the Indian Ocean. Sept. 21, the Hamburg-American liner Heina, employed as a collier, was captured by a French cruiser and taken into Martinique.....Sept. 22 three British cruisers, the Cressy, the Aboukir and the Hogue, were sunk in the North Sea by German submarines, about 1,000 men were saved, but the loss of life is said to be 1,163. Two of the submarines were reported destroyed.

Do You Want This Foot Warmer Free?

This dandy driving comfort is yours without one cent of cost. Burns charcoal cakes. Keeps your feet warm in zero weather. Get my offer and facts about the "Blue Grass" storm buggy.

Sunny Southern Comfort in Your Bleak Winter Driving

My famous all-enclosed storm buggy is warm on coldest days. Cool and shaded in summer. Full wrought straight grain hickory. Warp-proof doors with double strength glass. Roomy seat—ample leg room. Ideal farm buggy. Just the thing.

"Blue Grass" Storm Buggy At Bohon's Factory Price

Save $25 to $50 and get the best buggy you ever rode in. No middlemen. You get it at actual manufacturing cost plus small legitimate manufacturer's profit. Why pay more when you get this grade buggy at my special low price?

$30000 BOND Protects You When You Buy Bohon's "Blue Grass" Buggies

Unlimited guarantee on workmanship and material as long as you have my Buggy. Thirty days riding trial with money back if you don't like my buggy. You can't beat this fair offer.

LIVERPOOL, N. Y.

The Home Acre

NOTES FROM A MARYLAND GARDEN.

THE long-deferred rain came August 25, and we got some spinach seed sown, and are hoping that the favorable weather may continue. The rain came too late to save any of the early tomatoes, and the plants seem completely exhausted from the heavy fruiting. The late ones, from seed sown late in the open ground, have flourished in spite of the drought, and not being exhausted by fruiting, are now setting a good crop. I always try to have a good lot of well-grown tomatoes when frost arrives. The green tomatoes that have attained their growth are then gathered and each wrapped in paper and packed in strawberry crates, and put in a cool cellar. Then we take out a few at a time and ripen them in the kitchen window, and in this way have had tomatoes for slicing till January. It is also very handy to have a fresh crop of string beans just about frost time. These can be gathered and put in a strong brine in stone jars, and during the Winter we can take them out and soak in fresh water overnight, and the next day they cook very like fresh snaps.

Just now I am busy planting my Candidum lily bulbs. These must go in the ground early, so that they can make their rosettes of green Winter leaves, without which they would not bloom well next Summer. I had intended to increase my planting of these, and ordered 2,000 from the North of France, and now cannot say whether I shall get them or not.

The next thing in order is the planting of onion sets for the early green crop. The earliest of these is the Queen, sold by Norfolk seedsmen. This is a different onion from the Queen of the Northern catalogues, and is more like what is called the Pearl, but it is earlier and better than Pearl. In some Winters I get these large enough for use the last of February, and always in March. At same time, usually the middle of September, I plant sets of the Yellow Potato onion. After the Queens are used up, the offsets on the Potato onions come in very nicely for green onions, while the main bulbs are left to ripen, which they do here in late June, and always bring a good price, as ripe onions are usually scarce at that time. This year I got $2 a bushel for them.

My crop of grapes was cut short this Summer by the swarm of Rose chafers that settled on the blooms before I noticed them. I saved part of the crop by spraying at once with a solution of lead arsenate and glucose, and could have saved all had I been more watchful. We are apt to have this swarm here every season, and when the spraying is done in time can save the grapes, for they attack the blooms first of all. Our sandy soil here seems to be especially suited to the Niagara and Delaware grapes, and I seldom see finer clusters of these anywhere. Empire State does well and also Salem and Vergennes, and of course the Concord thrives. We are about on the northern limit of the Scuppernong. One of my neighbors has an arbor of the Scuppernong from which he gets good crops every Fall, and I know of a Scuppernong vine in one of the counties north of us where it gets killed back every Winter and fails to fruit.

I have found that horizontal training on arbors, which is universal with the Scuppernong, is also as good for the Labrusca and other grape species. In North Carolina I had a grape arbor over a garden walk, and experimented with it without spraying. The vines were trained on the vertical sides of the arbor and overhead. On the vertical sides the grapes rotted badly, while overhead there was no rot. On the Experiment Station ground there I had a long row of grapes of various kinds which had been trained on a vertical trellis. Half of this trellis I boarded up on the west side, and placed a coping over the top extending 2½ feet to the east. That part of the trellis was not sprayed. The other half was carefully sprayed. The vines on the sheltered part were not sprayed, and there was no rot there, not a particle, while there was a little on the sprayed part. I planted an experiment vineyard largely for testing the value of different fertilizers. This was trained on a modification of the Munson trellis, posts were set eight feet along the line of vines six feet tall. On the top of these posts cross bars 2½ feet long were bolted, extending 1¼ feet each way. One line of wire was stretched along the top of the posts, and two other wires on same level along the ends of the cross-bars. The vines were taken with a single cane to the central wire, and then arms taken each way, the fruiting shoots hung over the outer wires and the grapes underneath. This vineyard was purposely not sprayed, and there was no rot, while vines on vertical trellises in the same neighborhood rotted badly where not sprayed. In all my experience with grapes I have found that horizontal training is far better than vertical. My backyard is very largely a grape arbor, and I have also about 100 feet of vertical trellis, but the arbor gives more grapes and better, and I intend to build more arbor and take on it the vines now trained on the vertical wires. Cutting out old wood and training long renewal canes on the arbor gives me more and better grapes than the close spurring on the upright trellis. Then I never prune till March, for Fall-pruned vines start too soon in Spring, and are apt to get caught by a late freeze, and what little bleeding takes place from the Spring pruning is soon stopped by the swelling buds. W. F. MASSEY.

Maryland.

Sorrel in Lawn.

I HAVE a lawn of an acre or more, and it is over-run with sorrel. The sorrel seems to spring up in places which had been free from it before. What can I do to get rid of it? We have very dry Summers, so the grass does not grow as well as in cities when it is watered.

Eden, N. Y. O. H. H.

The presence of so much sorrel in the lawn indicates that the soil is quite sour and in need of lime to neutralize the acid. Apply about 1,500 pounds of hydrated lime, spread evenly, this Fall, and in the Spring apply a half ton of raw bone meal broadcast. The lime will sweeten the soil and make it uncongenial for the sorrel. The bone will stimulate the grass into strong healthy growth. The two operating together should bring the sorrel under control, and finally kill it out almost entirely. K.

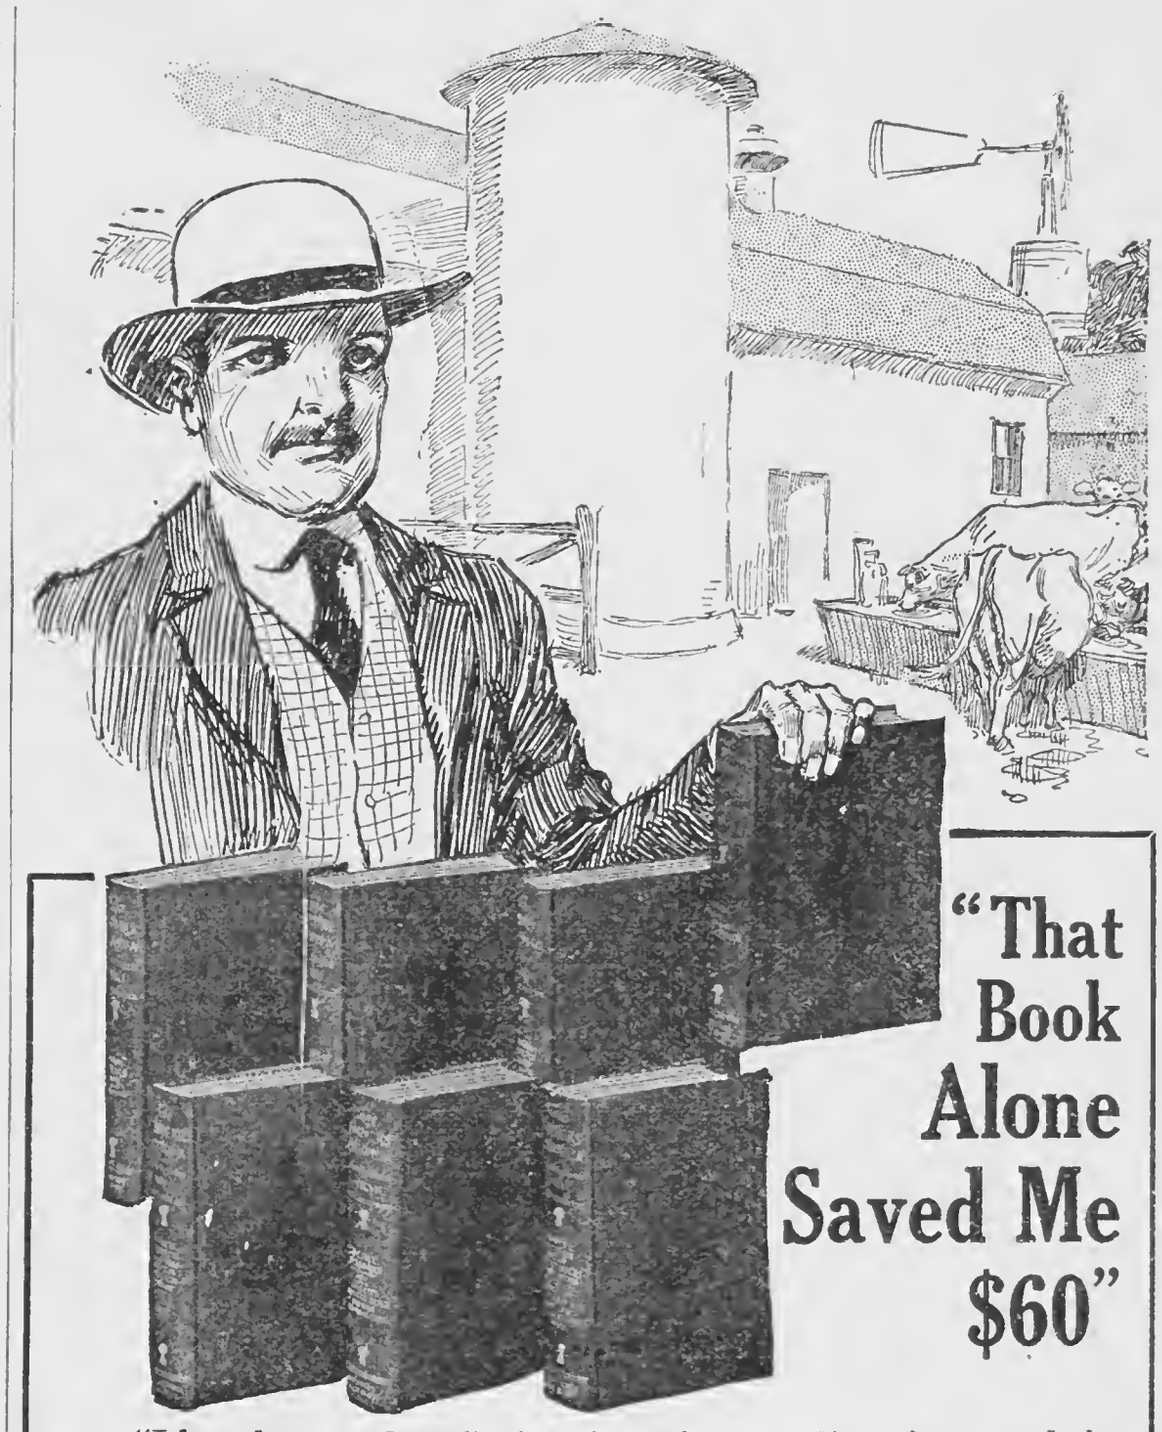
BUILDING VEGETABLE CELLAR.—I would build a vegetable cellar of concrete far enough below the surface of the ground to protect from frost, have adjustable ventilators in roof every six or eight feet, have entrance door at one end and have chimney in opposite end; chimney so arranged that it could be closed tight, avoiding draft, except when draft is desired, at the same time admitting of small fire when increased draft is desired. The dimensions of this cellar will be governed by the demands of the person building it. If not desirable and practicable to build deeply enough in ground to guard against frost, the structure should be surrounded with earth—roof and all—so that there would be no danger from frost. J. M.

New York.

ON page 968, H. N. of Cleveland inquires concerning bisulphide of carbon for squash-vine borers. The eggs of the borers with which I have had experience are laid at the first leaf joint or higher, and the borer when it hatches commences eating its way toward the root, through the center of the vine and by the time it gets there, or below the surface of the ground, where carbon bisulphide would kill it, the vine is useless for bearing, and almost always dead. The borer follows the root an inch or two and then enters the earth, being then about 1½ inch long and full grown. When I found vines which contained borers I slit them open lengthwise and removed them, but this treatment is almost as bad as the borers and the next case I find I shall try injecting some white hellebore or tobacco extract. I have found it better to use a preventive, in the form of moth balls, which are placed every four or five inches and keep the striped beetles away also.

Ohio. W. J. M.

All those who are interested in fruit shows, and fruit judging, should obtain a copy of "Timely Helps For Farmers," Volume VII, No. 11. This is published by the Maine College of Agriculture at Orono, Me. This little pamphlet gives an excellent study of the problem of the judge at a fruit show. There are pictures showing how to judge fruit, how to examine the box carefully, and in fact much information which the fruit judge ought to have. It is one of the best little pamphlets of this kind we have seen, and as fruit judging is becoming a science, the man who undertakes to do the work should collect all useful information on the subject.



"That Book Alone Saved Me $60"

"I bought a set last Spring, just about seeding time—and the second time I read it I found a new way of mixing fertilizer at home that would save me $60 over the way I'd been doing.

"It was taken from a United States Government Bulletin, worked out by an expert, so I knew it was all right. I tried it, and blessed if it didn't make a better crop than the old way."

If one volume save him $60—think what it will mean to you to have the whole **seven volumes** of the

Farmer's Cyclopedia

Abridged Records U. S. Dept. of Agriculture

Here you get, condensed and easily read, the experience that cost the United States Government ten years of work and $4,000,000 in actual cash. All theories and statistics have been cut out. All the real meat of the thousands of bulletins, issued for 10 years by the Government and the State Agricultural Departments you have here for 6 cents a day—if you mail the coupon *at once* without money.

We are farmers ourselves. Our plant is in open country. From our tree nurseries, flower and vegetable gardens we draw knowledge of untold value for our garden and country magazines, for our many farm books and for this big seven-volume work. We use the greatest authorities, but we try out things for ourselves to make sure.

And in every bit of work on this set of books we have had the help of the Department of Agriculture and the State Experiment Stations.

For Your Boy—Like an Agricultural Course

Give YOUR boy the right books—books about the farm. Give him the chance YOU never had—the chance to learn the HOW and WHY of farm life—and you'll keep him happy and contented, and make him a good farmer. For man or boy—too busy to go away—the Farmer's Cyclopedia will take the place of the Agricultural School.

No Theory—But Actual Experience

In these books is the result of ACTUAL EXPERIENCE of thousands of other farmers—experience that YOU could not get in a hundred years, working alone. No matter what you may think of "Book Farming"—when you learn what some other fellow did in a certain case, and you have just such a case on your own hands—you can do what he did and achieve the same success. These books place at your command the experience of keen, hard-working scientific farmers all over the country—men who have gone up against the same propositions you are facing, and have SOLVED them.

7 Big, Thick Volumes

Each volume 9 x 6 inches. Bound in strong cloth with gold backs, more than 5,000 pages—hundreds of photographs—diagrams, line drawings, sketches, plans, 3,000,000 words—indexed and cross indexed—every word of the 3,000,000 will come back in bigger crops, more product per acre—more money—and less work.

It Tells You—

How to Run the Farm Like a Business.
How Much It Costs Per Acre to Grow Various Crops.
Which Are the Most Valuable Varieties of Fruits for Your Section.
All about the Forage, Fibre, and Field Crops of the United States.
How to Make All Kinds of Spray Mixtures.
How to Establish and Maintain the Best Pastures and Meadows.
What the Farmer Can Do to Improve the Quality and Quantity of His Grain Crops.
How to Grow Rice, Hops, Mushrooms, Ginseng, Peanuts, Bamboo, Rubber, Pears, and other Specialty Crops.
How to Give Medicine to Animals.
How to Protect Hogs from Cholera.
How to Distinguish the Breeds of Horses, Cattle, Sheep and Swine.
How to Feed for Best Results.
How to Care for Sheep on the Range.
What You Must Do to Produce Certified Milk.
How to Eradicate the Cattle Tick and Texas Fever.
How the Foot and Mouth Disease is Combatted.
And a Thousand Other Things.

Make These Books Pay for Themselves

Your farm is your fortune—make it pay big dividends. Learn how to make the parts that don't pay profitable. You can reduce expenses in half a dozen big ways if you will only READ what other men have done—what the Government advises—in cases like yours.

Country Life in America for One Year

To keep you informed up to the minute each month you will get Country Life in America for a year. Country Life will tell you about THE BIG BUSINESS OF FARMING—BETTER STOCK—POULTRY—Regular price $4—a year's subscription included in this offer.

R.N.Y
10—3—14

FREE—Whole Set on Approval

We pay all charges both ways. Look over the 7 volumes. If you do not find something in every one of them that will be worth more to you than the cost of the whole set many times over, send them back. Otherwise, 6 cents a day pays for them—for the $4,000,000 and the 10 years of labor that is in them. Now is the time to have this set—now, before you do another single thing on your farm. The work you are about to do tomorrow, you may find a better way to do in these pages. **Send the coupon today without money.**

Doubleday, Page & Company

Hope Farm Notes

WEATHER.—Up to July we were finding more or less fault with the rains. It *was* wet during early Summer, but now we make up for it. The soil is dry and baked. You may now easily see what cover crops and lime have done for our soil. On pieces of land where for some reason our regular plan has not been followed the soil is so hard that a pickax would be necessary to open it. On the same kind of land where rye and lime have been used for a number of years, the soil is open and mellow—you can kick it up in dust with your feet. The color is darker and even in this dry time you can find dark colored soil down below showing that there is still a supply of moisture. This has been an ideal season for this kind of farming. The Spring was wet and this made a heavy crop of rye without drying the soil too much. The lime in this damp soil quickened decay, and the rye was rapidly broken up. Had it been a dry Spring I would not have let the rye grow so large, as this would have taken too much moisture out of the soil. As it is now the rye, turnips and rape in the corn are growing very slowly, and will not come to much until we have rain.

LATE CROPS.—You remember how we planted potatoes at July 4? A five-year-old strawberry bed was turned under and the potato seed put right down into the mass of vines and weeds. The seed was not the best yet on September 25, most of the vines were still green and thriving. A few are dead, but apparently the greater part will grow until frost kills them. As we expected, that heavy, green mass turned under held the moisture just where the plants needed it. I think this experiment will succeed.....The old strawberry beds look better than ever this Fall. They had been fruited four years, but we needed them one more year. Right after fruiting the vines were cut with the mower and raked off. Then with plow and cultivator the middles were ripped out and a narrow strip of plants left. Hoeing the grass and weeds out of this strip was a long and expensive job, but the dry weather helped and we took the time to rake up the weeds and dump them around the apple trees, for the cultivator is kept going, and we have a fine new growth and strong plants for next year's fruiting....The Japanese millet seeded late after cutting rye for straw and grain, is growing well and proves a good yield. Corn cutting began September 22. Part of the corn in the young apple trees is poor—the rest is good

FRUIT.—By September 25 I figured that we had eaten peaches continuously for 60 days—beginning with Alexander and running through Greensboro, Carman, Belle of Georgia, Niagara, Elberta, Mountain Rose, Crawford, Crosby and others. Our crop was larger than ever before, but it has been a peculiar season for selling. Many people who formerly bought peaches for canning have this year refused to buy—complaining of the high price of sugar. It seemed strange to me that they could not see that the low cost of peaches more than offset sugar prices. Some of the smaller fruit has been slow of sale, but the larger peaches have brought fair prices..... Our apple crop is good, and I am selling it off rapidly. By September 22 the Wealthy and Twenty Ounce had all been sold, and we were working off the McIntosh. Northern Spy is a Fall apple with us, and that and Greening will go next. I shall let the Baldwins hang to the tree as long as is safe, and then get them off rapidly. If conditions were normal I should put up a storage plant this year and hold the fruit, but the lack of an outlet to Europe will complicate the situation here. No poor or low grade fruit should ever be sent to market this year. Far better give it away as an advertisement.

PUBLIC MARKETS.—The farmers in our section are interested in the market discussions, but the trouble is to transport our produce. On every farm in this neighborhood can be found fruits and vegetables that will be wasted for lack of transportation. With only one team or three horses, how can a farmer haul all his perishable stuff and at the same time do his farm work? A load of fruit goes from Hope Farm practically every day, yet we could send more, and in fact we could often use the horses to advantage here. Another year I shall evidently be obliged to get some sort of an auto-truck. In order to make these public markets successful I think some sort of swift trucking service will have to be arranged. If some auto-truck could make a daily trip through our section, picking up produce from farm to farm, we should soon get into the habit of providing for it, and arranging to send tons of produce during the season. Most of this produce would not otherwise be sent away, but it would be a great help to the city buyers and a help to us when it was taken away. This side of the public market question has not been discussed yet, but it will have to be worked out before these markets reach anything like full success.

PEDIGREED ASPARAGUS.—You will remember how last Spring we planted a pound of superior asparagus seed. This was our first experience with this crop. After much hard work at weeding we have about 15,000 good plants. The variety is Reading Giant of a rust-proof strain. This is the variety which has been selected from immune plants. The original male parent was one plant out of nearly half a million, which showed no rust in a locality where every effort was made to spread the disease. Later the experimenter found a female plant which stood up and resisted the disease while hundreds of thousands around her went down with rust. By breeding these two strong plants together the plant breeders have obtained a strain of Reading Giant which may be called disease proof. The seeds have grown well on our soil, and I think the roots will be good ones. I expect to go into this business on a larger scale next year.

"DUMPLING" WYANDOTTES.—I should judge that our friend, John H. Robinson, must be having an ideal time just now. He recently printed more than half a page in his paper entitled, "The Hope Farm Man' as 'Mr. Facing Both Ways.'" He seems to find fault because I do not engage in a long controversy over a matter which eggs rather than words should settle. Of course, we all understand that Brother Robinson is doing very well what the boys call "playing to the galleries." That is good fun and very profitable at times, and I have no desire to interfere with it. And now, for the last time, let me state the case as I see it: We printed a picture of what the Standard of Perfection calls an ideal White Wyandotte. I called it a dumpling, and said that I do not believe a hen shaped like that one can be a good layer. The more I look about, study Wyandottes and hunt up their records the stronger I will make that statement. Now, of course, Brother Robinson knew well enough what I meant. There was no thought of discrediting the Wyandotte as a breed. No one can do that in the face of the records which Wyandottes are making at the egg-laying contests. What I did say, and what I repeat is that the "ideal" Wyandotte, as represented in that picture is not a good layer. It suits Brother Robinson's purpose to try to make it appear that I am in some way attacking the breed. Under such circumstances a long wordy controversy with him would get nowhere, and I cheerfully admit that I am no match for him at "talking about it." I want him to let his hens talk, or rather lay. In my own case if some one stated positively that a horse or a cow or a hen in which I was interested could not trot or milk or lay profitably I should not expect to settle it by *talking*. I should come back to the old text:

"He is of age—ask him!"

I should put my animals right up where all could see the work if I really had faith in them. That is what I call upon Brother Robinson to do. Let him enter a pen of what I call "dumplings"—which means birds shaped like that "ideal" picture—at one of the egg-laying contests, and then stop talking and let his hens settle it. I see no better way to decide it. When I was a boy there was a five-word comment which seemed to me very appropriate: *"Put up or shut up!"* Perhaps Brother Robinson does not want to do either! H. W. C.

"YEP, I've made up my mind to get rid of that auto I bought from Pete Haskins. Guess I'll let it go for $30 jest as it stands." "What you want to do that for?" "'Cause it won't move."—Cleveland Plain Dealer.

Painted 12 years ago

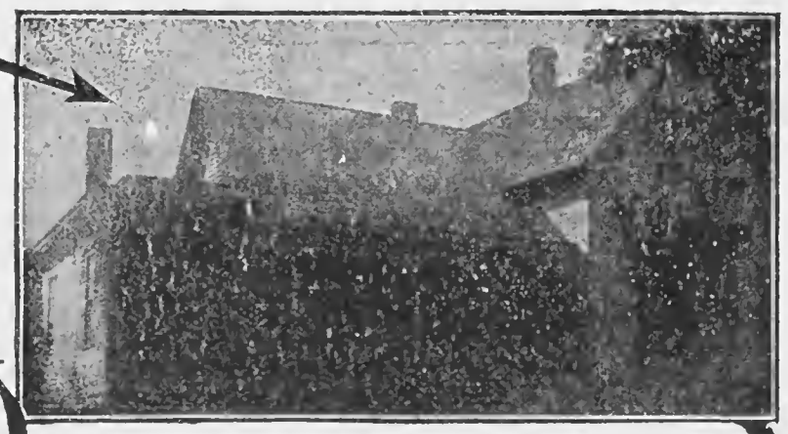
This house, in an Iowa town, was last painted twelve years ago with

Lowe Brothers High Standard LIQUID-PAINT

On the north, west and east sides the paint is still intact without any cracking or peeling, and will last several years longer. On the south side of the building the paint has worn off evenly, leaving a good surface for repainting. The paint on the house next door, painted six years ago with other paint, is in bad condition, being cracked and alligatored. Good paint pays.

FREE: Write for "Paint and Painting"

It tells how good paint is made, and how used for the most pleasing and lasting results. It's worth reading.



You, too, can get long wear from "High Standard" Paint

The above instance is just one of a large number. The ability of Lowe Brothers "High Standard" Paint to withstand the weather, is not due to luck or chance. The making of this paint is based on thousands of exposure tests throughout a third of a century. We make our paints as carefully as a druggist "puts-up" his prescriptions. Paint next time with long-wearing "High Standard." You are sure to be satisfied.

There's a "High Standard" dealer near you. You can rely upon his paints, varnishes and enamels for good results and economy. Ask us for his name if you don't know him.

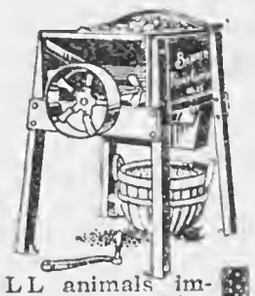
Feeding Roots: More and Better Milk—Beef Mutton



ALL animals improved condition and increase their product of flesh, milk, wool, etc., by being fed liberal rations of cut roots. No matter what else you feed, cut roots will improve the ration. They add a zest which means increased consumption of roughage and aid in digestion and assimilation. They put a top finish on market sheep and lambs. They put color and richness in milk and cream and resulting butter.

Banner Root Cutters

for both hand and power, prepare roots in the best possible way. Cut so fine as to prevent all choking of animals. It's done with the **"Non-Choke Curve Cut."** Made in seven sizes. Write for free illustrated booklet. Every animal condition will be improved by feeding a ration of cut roots.

DRYING PERSIMMONS IN CHINA.

BULLETIN 95 of the Office of Foreign Seed and Plant Introduction reports that cuttings of 52 varieties of persimmon have been received from the provinces of Shensi, Shansi and Honan, China. Some of these are seedless, some specially desirable for drying, while others are used in China for the distillation of brandy. Regarding the drying, Prof. Meyer, the explorer who obtained these says:

In early October sound fruits are picked, which although ripe, must still be hard, care being taken to have the peduncle with a piece of twig attached to each fruit. The fruits are peeled by means of a small, special knife and an average worker can peel 2,000 persimmons a day, while an expert brings it up to 3,000. The peeled fruits are tied by means of their peduncles, on a loosely twisted, but strong sort of string, which hangs down in pairs vertically over horizontally placed beams which have been put up specially for this work. From 200 to 300 fruits are tied to each string and the work of tying starts by putting a couple of fruits at the bottom first, so as to keep the strings taut, after which the work progresses from top to bottom. The fruits are now left hanging for about twenty days, in a warm, sunny situation where if possible the wind can also blow, but where there is freedom from dust. The persimmons should be squeezed and manipulated by hand every four or five days, so as to assist them in drying uniformly and prevent them from becoming hard in spots. After they have been drying thus for about three weeks, they are taken down strings and all and a cool place is selected where they are all put into a big heap and covered over with matting. They are now allowed to sweat for ten days, during which process a dry white powder of sugar forms itself on the surface of the fruits. When sufficiently cured they are hung up again for a couple of days, preferably in the wind, so as to let them dry off. In the meantime the peelings have been carefully dried in the sun and kept in airy baskets. The fruits are now taken from the strings and put in baskets and jars with the dried peelings in between and over them and they are now ready for the consumer. Another method of drying which is practiced often with the smaller varieties, is to run in a spiral or horizontal way a knife point through the skin of the fruits, and then to put them in the sun on coarse matting. After they have dried for several weeks, they are thrown into a pile and covered up with matting or sacking, allowing them to sweat. When through with this process they are ready for the market. Persimmons treated like this are as a rule of much inferior quality to those that have been given more care but on the other hand they sell so cheaply that even coolies and beggars regale themselves on them. These dried persimmons are a most wholesome and pleasant food, comparing very favorably with dried figs, and often even preferable to them, being less revoltingly sweet and not possessing the multitude of objectionable small seeds. There are large sections in the United States, especially in the Southwest, where no doubt the dried persimmon industry could be successfully established and with up-to-date methods of artificial drying and curing a much cleaner and probably superior article could be obtained than the product seen in China and the nation would be richer by a new and wholesome food product.

New Citrus Fruits.

BULLETIN No. 96 of the Office of Foreign Seed and Plant Introduction reports a seedless pomelo secured from the Philippine Islands. It was stated by the grower that the seedlessness was due to the salt deposited from the brackish water which backs up into the river during the dry season; the planter also said that a cocoanut shell of salt was placed in the hole at the time of transplanting the tree, and that another shellful was given the tree each year.

An orange introduced by the recent Brazilian expedition of Profs. Shamel, Dorsett and Popenoe is known as Laranja selecta. Bulletin 96 says:

This unusually choice orange is one of the two principal varieties grown in the Rio de Janeiro district, and has the added distinction of having been, as all the evidence indicates, the parent of the Bahia navel orange or "selecta de umbigo," as it is still called, the culture of which in California at the present day forms so important an industry. The origin of the "selecta" orange is obscure. It has been cultivated in Brazil for more than a century, and although it has been superseded in Bahia by its offspring, the navel orange, it is still cultivated commercially near Rio de Janeiro, particularly in the Sao Goncalo district at Nictheroy. The main crop ripens in July, but it commences to come into the market in March and continues until October. On the fancy fruit stands it brings two or three milreis ($.65 to $1.00) per dozen, but in the public market it can be purchased at a considerably lower price. Around Nictheroy the fruit is picked and brought to the market in baskets strapped across the backs of mules and horses.

GERANIUMS.

THE double flowering geraniums are far superior to singles for outdoor bedding, as the loss of a few petals in a storm does not spoil their beauty as with the singles, but for indoor specimen plants I choose the singles. The specimen geranium is a Winter bloomer of necessity, for they do best in a moderate temperature such as is afforded by fire heat. Having chosen the kind you wish, root as many slips early in Spring as you care to grow. See that these slips are short and of new growth, preferably with a side branch coming out near the base. When nicely rooted put in small pots, two-inch to 2½-inch size. When the roots have filled these pots put into the next size larger and pinch back the branches that are growing rapidly. This pinching process may be continued till the plant is of the desired shape, either tall with few branches or dwarf and very bushy. The soil should be only moderately rich, and with no new manure in it, for that would force a soft sappy growth to the great detriment of any bloom. Always keep a geranium in a pot just large enough to care for its roots and when ready to bloom should be nearly pot bound. During Spring and Summer keep all buds picked off. The first of September stop picking buds and let your plant bloom at will. The plants should have been outdoors all Summer, either plunged in the earth or on a light sunny porch. On bringing them into the house—and don't wait until the weather forces the operation—put them near an open door for a while till they get used to the change. From outdoors to the window direct will cause a loss of most of the leaves.

The enemy of the geranium is red spider, but red spider hates water and can be driven away by washing or spraying the plants. Dust is hard on geraniums. As the florists say, keep a geranium "on the dry side," that is, never water the soil until it is dry, and then do it thoroughly. Also never get the leaves wet on cloudy days or so late in the day that the sun cannot dry them off. This applies to indoor culture of course. With the above treatment, which is comparatively simple, large plants should be produced that will carry during most of the Winter four to eight splendid trusses of flowers. Keep your plants turned daily to prevent their growing one-sided, and don't crowd a window with too many. An ordinary dwelling window can care for not over three of these specimen plants. It is too late now to start new slips for next Winter's bloom, but you can keep the buds off such plants as you already have for a period of four to six months and then secure the same results. For specimen porch plants out of door pursue exactly the same treatment, rooting the slips in late September and keeping the buds off till May 1.

For double crimson S. A. Nutt is the most grown variety, makes a splendid single plant, is an unsurpassed bedding sort and will stand heat and sun. Alphonse Ricard is a splendid semi-double orange scarlet. In white, Mme. Buchner is standard. Two of the very finest for specimen work are Madame Barney, pure double cerise pink, and Mrs. E. G. Hill, a great single salmon. Both carry exceedingly large trusses in the Winter. In single scarlet I have a kind called Jumbo that is very fine. Poitevine is the standard semi-double salmon and Viaud is the standard pink. The list is endless and can be added to at will and with great pleasure.

The ornamental leaved geraniums are very popular. Mme. Salleroi being best known, grows but six inches high, green and white and is used for edging. A silver leaved S. A. Nutt is now offered which is fine. Many sorts with red and yellowish zone in the leaves are offered, but the flowers of all are insignificant. The ivy geraniums are beautiful plants to grow, but bloom infrequently and are a little hard to manage. When right the bloom is more beautiful than the zonal geraniums.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

AT the celebration of the battle of Lake Champlain, on September 11, Gov. Glynn very properly retold the famous rooster story:

It is related that during the battle, a shot from one of the British ships shattered a packing case and liberated a rooster which flew upon one of the guns on McDonough's flagship and crowed a lusty defiance at the enemy. To-day the American eagle looks with pride upon that rooster's exploit, but it has no disposition to emulate its achievement.

Many of us would nominate the American rooster as a candidate for the place now occupied on the flag by the eagle. The old war eagle is a back number. He never did anything but fight, and if we tell the truth about him he was a nuisance and a fraud in his relation to American industry, a thief and a coward—stealing the farmer's chickens and lambs and fighting weaker birds or small animals. The rooster, on the other hand, represents his wife and sister, the "Business Hen," who has long stood as the faithful friend and supporter of humanity. Had there been an eagle in that coop at Lake Champlain he would have promptly put several miles between himself and danger. The rooster remained at the front and challenged the enemy. Call the eagle down and raise the representative of the Business Hen, or why not the hen herself?

*

THE free public markets in New York have not yet been able to attract many farmers. As we have explained, New York City is a hard city to enter with produce—located on a long, narrow island, with high hills and a marsh to the west. There is plenty of produce within 50 miles of the city if it can be collected and transported. This problem of bringing in the produce is the vital one now. At any rate the starting of these free markets and the discussions in the daily papers have been of great benefit to the public. City people do not usually think except along the lines of their reading in the daily papers. As they see day after day articles on these markets and discussions of the price of food they will soon come to regard this marketing question as one of the most important of any which touch their lives. There is no other way to bring this thinking about except a full discussion in the daily papers. If this can be kept up city people will soon realize that a 35-cent dollar for the farmer means a 165-cent dollar for the buyer. Once let them realize that and they will soon kick over the machine which plays with their dollar.

*

EVERY year at this time we have calls for a trespass sign to put up on woods and fields as a warning to hunters or roamers. Such signs need not be elaborate. The following in large type will answer:

Trespassing on this property for any purpose is forbidden under penalty of the law.

————————, Owner.

The local printer ought to do a fair business in printing and distributing such signs. They should be posted co-operatively. That is, all the farmers in a neighborhood should combine and post all their farms uniformly. Then they should agree to enforce the law and unite, if need be, to drive trespassers away. We have heard of one place where the farmers posted their farms in this way, and then sent a note to the local papers which read about as follows:

We, the undersigned residents of ———————— neighborhood, have posted our farms against trespassers of all kinds. We have agreed to unite in resisting any encroachment upon our rights. Anyone who enters our property without permission is hereby notified that he must take the consequences. Signed.

That is about what it is coming to if the sports and hunters are not checked—and we do not know of any better way of checking them than this form of co-operative support.

READERS who have apples or other fruit of which they are not sure should send it for identification to

U. S. POMOLOGIST,

New Jersey readers who desire a home identification may send to

PROF. M. A. BLAKE,
New Brunswick, N. J.

It is very important to know just what you are growing, especially if you ever intend to propagate from your own trees.

*

I THINK there are two things we should do with experience, first see that we benefit by what has been profitable, and then, if possible, pass it on to the other fellow who thinks he needs it. And when it comes to the latter I think your organization is doing it in a more generous and beneficial manner than any similar organization I have ever came in contact with.

ELMER J. WEAVER.

Our readers frequently express what we would like to say far better than we can do it. This idea about experience is an illustration of what we mean. Mr. Weaver himself has done as much as anyone to help "pass it on." As for the organization, we are fully justified in saying that THE R. N.-Y. has gathered about it the most competent and complete Company for the gathering and distribution of intelligence about farming ever known in the world. Our readers make great use of it. Since January 1 of this year the editorial department alone has written 14,178 letters—which means that about 18,000 questions were answered by mail in addition to those printed. We are enabled to do this work accurately through the cheerful and conscientious help of people like Mr. Weaver, for the best farm intelligence is accurate and tested experience "passed on to the other fellow."

*

WITH the opening of schools this Fall the laws in several States directing the vaccination of school children are being enforced, and are arousing considerable opposition in some places where there are parents opposed to this measure. Much of this opposition, whether with reason or not, is due to a sincere fear of the possible results of vaccination, and some of it is probably due to natural opposition to compulsory laws affecting what people consider their personal liberties. The country doctor has never been an ardent advocate of compulsory vaccination, though he recognizes the value of the measure. While few of the present generation, even among physicians, have ever seen a case of smallpox, its very name still strikes terror in the hearts of those whose ancestors were literally slaughtered by the millions by this scourge which formerly roamed the world unchecked, and which, until the introduction of vaccination, about the year 1800, annually numbered its victims by the thousands. Many who escaped death were blinded and otherwise so disfigured as to make life a doubtful blessing. It is possible for accidental inoculation with disease germs derived from dirty instruments, hands, clothing or other sources to infect a vaccination wound, and, in rare instances, impure virus has made serious trouble. Pure vaccine virus from healthy calves is always harmless, however, and it is entirely possible to guard against accidental infections. When properly performed by competent hands, vaccination is as safe as it is possible for the most minor operation to be, and the timidity which would forbid this would, if logically carried out, forbid the extracting of a decayed tooth or the paring of a corn, both of which ordinary procedures have resulted fatally. The one thing required to make vaccination safe is the observance of strict cleanliness during and after the operation. Vaccine virus is always, nowadays, put up in sealed glass tubes or on equally well-sealed ivory points. Neither should be opened until just previous to using. The arm should be washed with clean soap and water and dried on a clean towel; the operator's hands should be washed and any cutting instruments used should be sterilized. After the operation, the best dressing for the little wound is a soft pad of clean cloth, a freshly-washed and ironed handkerchief being as good as anything. This should be pinned over the arm in such a way that neither dirty clothing nor anything else can come in contact with the sore. No grease or ointments should be used, and when the discharge makes it necessary to wash the arm this should be done with boiled, and cooled, water, and the clean dressing immediately replaced. With these simple, but necessary, precautions upon the part of the physician and parents, and the use of fresh virus from an absolutely reliable source, no one need fear vaccination.

ON page 1108 you say: "Whenever a nation moves nearer to a republic or a more liberal form of government, the military spirit weakens, and with it the desire for fighting."

Are you sure of this? Remember how fiercely the first French Republic fought from 1790 to 1805. And we ourselves, secure as our position makes us, have had five, one of them the greatest civil war on record.

C. E. D. PHELPS.

It is a question whether the first French republic was a "liberal form of government." Surely the "Reign of Terror" was anything but liberal, and the French wars were mostly forced upon the nation by efforts to restore or maintain a monarchy. Surely the fall of both Napoleons led to peace. As for our own government the Revolutionary War left the country full of a fierce fighting spirit, yet Washington and all the wiser statesmen, declared that America must stand for a policy of peace. Every war, except the Mexican War, has been fought to give what the fighters believed would be a more liberal government. To-day there is less of the "fighting spirit" in the nation than ever before.

*

THE apple crop problem has become a serious one. Our reports indicate few sales thus far, and a shortage of buyers. At some of the fruit centers where, in former years, buyers were as thick as flies, hardly one has yet appeared. No one knows just what the foreign situation will develop into, but it is evident that American markets must absorb much of the stock which would be sent to Europe in time of peace. We think this American market will take care of the surplus if it can be distributed properly. During the past week we have received six letters from parties in the Middle West, who ask where they can buy apples in carload lots direct from from growers. That section of the West and the South are short of apples, and can take great quantities of our Eastern fruit if moderate prices are charged. Here seems to be an opportunity for the farm bureaus East and West to help in distributing the large Eastern apple crop. The home market has never been fully developed. Now is the time to organize and push the sale of apples into every home.

*

"IT will pay the farmer to secure a Babcock tester," was the remark of an employee of one of the large bottling and milk shipping concerns operating in New York State. "This is the reason," he added. "I have been testing milk since I became connected with my concern. Some farmers just pass the 3.8% mark and secure the 10 cents bonus, and I find there are a good many herds which do even better than that. I had a remarkable surprise. I tested one farmer's milk, and it lacked just two points of six per cent. I doubted my test. I run through the test again with extreme care, found that I had been absolutely correct. This farmer is ignorant of the possibilities in his herd for butter-making, he only gets the 10-cent bonus, and is losing money every day. The added equipment for butter-making would be small, and the labor necessary would scarcely be more than that involved in bringing his dairy product down over the hills to the factory each day. Then there is value in the skim-milk, depending on the use to which it is placed. It should be worth 20 cents the hundred, and it is an easy matter to figure how much this farmer is losing daily. Farmers are not asking for their test, and I find a good many are satisfied to get through, others to get the bonus, and they seem blind to the possibilities in their herds. It would pay the farmer to ask us what his herd tests, and further to put the scales and tester in his own barn and make each cow make good or leave."

BREVITIES.

NO cedar trees, no cedar rust on apples.

FALL plowing beats the cover crops when the soil is filled with white grubs!

ON a good many South Jersey farms this year sweet potatoes will just about pull loss up to profit.

AN effort will be made during the coming Winter to organize the vegetable growers in New Jersey.

THE West Virginia Experiment Station will send out well-bred Leghorn cockerels of a heavy laying strain to West Virginia farmers under special condition.

TOBACCO stems will rank as a potash fertilizer. If you can buy them at a fair price by all means take them. Tobacco is one of the plants which takes large quantities of potash from the soil.

THE Alabama Experiment Station has made a full study of the boll weevil situation and cotton growing. It warns cotton growers in time that this insect will compel them to change their farming and their crops.

NOW we hear from parties who say they want to start a poultry contest as a commercial proposition. They would charge $15 or more per pen and plan for 50 or 100 pens. The time has not yet come for such individual contests. They should be controlled or safeguarded by some government institution or some great public enterprise so as to carry weight and authority.

NEW YORK FOOD PRICES.

THE new public markets in New York have started lively discussion in the daily papers. This has had the good effect of calling attention to food prices and methods of sale. This is just what New York has lacked up to this time. Farm products have been bought without much consideration of price. If the present discussion can be kept up it will not be long before the buyers begin to figure closely, and when they do that they will realize the wide margin between what they pay and what the producer receives, with that will come such a demand for better marketing and shipping facilities that it cannot be resisted. The following figures show the prices quoted at three of the New York public markets on September 18:

	Fort Lee.	Harlem.	Queensboro.
Lamb chops (pound)	22	..	20
Hindquarters	20	..	14
Shoulder	15	..	11
Steak (Delmonico)	22	18	24
Rib roast	18	14 to 15	16 to 20
Fresh broilers	20	18 to 20	20
Young roasting	20 to 22	20	20
Fowls	18	16	16
Eggs—Fresh brown	35	32	..
Eggs—Fresh white Leghorn	45	43	..
Fish—Flounders	5	5 to 6	8
Bluefish	9	7	..
Cod	5 to 10	6	6
Porgies	10	6	8
Butterfish	5	6	6
Weakfish	5	5 to 6	..
Vegetables—			
Corn (dozen)	30 to 20	25 to 20	30
Potatoes (pound)	1 2-3	1 2-3	1 3-7
Cabbage (head)	2 to 3	2½	4
Cauliflower (each)	10	5	4
Lettuce (head)	5	4	3
String beans (quart)	5	7	5
Fruit—			
Muskmelon (each)	..	5	4

The following table showing average retail prices for produce during August and September is prepared by the Bureau of Weights and Measures:

VEGETABLES.

	August. High.	August. Low.	September. High.	September. Low.
L. I. potatoes (lb.)	2	2	2	2
Cabbage (head)	5 to 6	4 to 5	5 to 6	4 to 5
Corn (dozen)	25 to 30	20 to 30	25 to 30	20 to 30
String beans (qt.)	8 to 10	7½	8 to 10	5 to 8
Green peas (qt.)	10 to 12	7½	8 to 10	7 to 8
Tomatoes (lb.)	2½	2½	2½	2½
Lettuce (head)	5 to 6	4	5 to 6	5
Onions (pound)	2½	2½	2½	2½
Lima beans (qt.)	10	8	10 to 12	5 to 8
Best creamery butter	36 to 38	35 to 37	35 to 37	35 to 37
Flour (3½ lbs.)	14 to 17	13 to 15	14 to 17	14 to 17
Sugar, granulated (3½ lbs.)	22 to 27	21 to 25	23 to 26	22 to 26
Eggs (dozen)	35 to 38	35 to 38	35 to 38	35 to 38
Loose milk (qt.)	6	6	7	6

MEATS.

	August. High.	August. Low.	September. High.	September. Low.
Loins of pork	22	20	22	20
Pork chops	26	20	25	22
Veal (leg)	21	20	24	20
Cutlets	32	30	34	30
Shoulder	16	16	20	16
Breast	18	16	20	16
Stew	18	16	20	16
Bacon (by the piece)	26	25½	25½	25½
Bacon (sliced)	28	28	28	28
Smoked ham	21	20	21	21
Cal. shoulder hams	16	16	16	16
Fresh ham	22	22	22	22
Fresh fowl	24	20	20	20
Fresh roosters	16	16	16	16
Frozen roast, chickens	28	23	23	23
Fresh broilers	23½	22	23½	23½
Long Island ducks	22	21	21	21

FISH.

	August. High.	August. Low.	September. High.	September. Low.
Steak cod	16	12	16	12
Live cod	6	6	6	6
Bluefish	12	10	14	10
Weakfish	12	7	6	6
Butterfish	10	8	9	8
Bass	14	8	8	8
Haddock	6	5	7	5
Mackerel	16	12	18	14
Halibut	16	14	16	14
Eels	18	16	16	16
Porgies	10	7	8	7
Hake	10	8	10	10

In comparison with some of these prices the New York *Sun* prints figures from an Englishman as follows:

	Manchester Prices. (Cents.)	Maximum Recommended. (Cents.)
Lump sugar	7 to 8¼	8¼
*Granulated sugar	6 to 6½	7½
*Butter	25 to 26	35
Cheese	16 to 18	20
*Lard	14	16
*Margarine	13 to 16	18
*Bacon	18 to 26	24 to 26
Flour, a dozen lbs	36 to 44	
*Beef (English) boiling	10 to 12	
*Beef (English) best joints	25	
Mutton (English)	12 to 24	
*Beef, frozen	12 to 22	
Mutton, frozen	12 to 18	

*These are, no doubt, American.

THE WAR AND COMMERCE.

EXPORTS from New York are now about normal, the value for the week ending September 29 being the largest of any week since April 25. The lowest amount was for the week ending August 22, $8,477,361. The total since January 1, 1914, was $620,075,543, or about $12,000,000 less than for the same period of last year. Galveston, Texas, shipped nearly 4,500,000 bushels of wheat to Europe during September.

Ocean freights on apples have advanced. The Anchor Line, New York to Glasgow, now charges, for ordinary storage, $1 per barrel, and $6.75 per 40 cubic feet space for boxes. In refrigerators the cost is $1.25 per barrel and $9.25 per 40 cubic feet. Some Canadian apples are being brought to New York for European shipment, as a great part of the lines sailing from Canada at present are transporting grain and war supplies. Ocean rates on other products to Liverpool are: Grain, 5 to 6 cents per bushel; cotton, 40 cents per 100 pounds; flour, 100-pound sacks, 20 cents per hundred; lard, ton, $7.50; butter, $11.25 ton; leather, ton, $5; beef and pork, ton, $4.30.

There is some improvement in the cotton outlook. Exports are increasing, 27,000 bales having been shipped from Galveston during the first half of September. Considerable movement in buying cotton at 9 to 10 cents per pound to hold is reported from civic associations and private individuals.

THE DAIRYMEN'S LEAGUE MEETING.

AT a directors' meetiug held in Albany, September 18, to which local branches were invited to send delegates or letters expressing the sentiment as to the advisability of accepting or refusing the general prices offered by dealers for milk for the Winter months, about 100 branches were represented.

It was the unanimous opinion that the prices offered were inadequate considering the probable increase in cost of production due to high feed prices and many felt that the farmer should positively refuse to accept the prices, still a majority of the branches represented hesitated to vote for the proposition: "that the producers at this time demand an increase in the schedule of prices offered."

In view of the above action, and that less than one-third of the branches were represented, and with the information that large numbers of the members had hastily obligated themselves to sell for the next six months, much of which was due to the late date on which the stockholders forwarded their agreements to the directors, which left too short a time for the directors to consummate their plans and have them thoroughly understood by so large a membership, the unsettled business conditions and prices arising principally from the European war, the final disposition of pending legislation which may affect our organization, and also that of about one-fifth of the local branches, which have or are constructing receiving stations for their milk—a number will be uncompleted October 1, the directors in executive session decided it was unwise to contest for a definite increase in the price of milk for the Winter months, but that definite plans shall be made for October 1, 1915, and all members are cautioned against binding themselves by contracts unless absolutely necessary, for periods longer than six months and expiring either April 1 or October 1.

It will doubtlessly be a disappointment to many that more tangible results cannot be attained at this time. Such complicated conditions never before confronted the organization, no one could foresee or forestall them. Let all be conservative, loyal and true, remembering that without organization, the milk producers' position would be one without hope.

ALBERT MANNING, Secretary.

FARM PRODUCE BY TROLLEY.

I READ with interest your editorial, on page 1108, concerning the opening of public markets in New York City giving a good opportunity to farmers within 50 miles of the city, and in which you suggest among other things the use of auto trucks to transport produce. This is indeed a good suggestion where farmers can coöperate, but why not make use of our extensive system of trolley lines in the transportation of produce at night? A coöperative organization could be formed, one on Long Island and another in New Jersey, to handle such produce, and which could secure from the public service corporations that now operate the trolley lines the use of the tracks at night when passenger traffic is lightest. Cars could be constructed for the varions kinds of produce and dairy products and side tracks could be run right into the farmer's premises where he could load up his produce and consign it to the agent of the coöperative organization in the city market, thereby saving to himself the great loss of time incident to a trip to the city and back. The result would be a great saving in time and in the handling and rehandling of produce as it is now carried. Of course in the case of the New Jersey farmers their produce would have to be distributed from the New Jersey side of the river for the present, and until more tunnels for trolley lines under the Hudson are constructed, but a comprehensive plan could be evolved for the handling of farm produce that would materially aid the farmer as well as the consumer, thereby raising the value of the 35-cent dollar, and without increasing the cost to the consumer, could we have the use of the trolley lines at night in the manner indicated. I believe many farmers would be glad to use the facilities offered by such a system of distribution could they be assured it was in competent hands, and that their produce would be fairly treated when it reached the market place.

GEO. L. STEVENSON.

Somerset Co., N. J.

R. N.-Y.—This suggestion has been worked out into fact in some localities. Some years ago the writer rode from J. H. Hale's place to Hartford, Conn., at night with a carload of peaches. This car was run at the time when passenger traffic was lightest. The peaches were carried in rapidly and promptly distributed.

New York State News.

FOREST LANDS RECLAIMED.—The Attorney General's office has recovered from squatters who have taken over large tracts withiu the forest preserves as private property, virgin forest valued at about $350,000, and comprising about 37,000 acres in various parts of the Adirondack preserve.

RURAL LIFE PICTURES.—A plan has been adopted by the Farm Brokers' Association of the State to obtain a large selection of New York farm scenes for advertising work in connection with the Department of Agriculture and trunk line railroads. Prizes are offered for views of farm work, pastures with stock, harvest scenes with modern machinery, landscapes, etc. This Fall a New York farming train will be run through the Middle West, equipped with lectures, photographs and agricultural exhibits, and moving pictures will show the best methods of farm work in this State. The train will be in charge of Chas. W. Lamon, of the Land and Labor Bureau, who will be assisted by Prof. Chas. Grein, of Cornell, and is to start the last week in October.

GERMANTOWN FRUIT SHIPMENTS.—Germantown in Columbia County, is one of the largest shipping points for fruit anywhere along the Hudson River. On Sept. 16, 22 carloads of fruit left that station. Of these, 20 were grapes and two apples. On the two days previous 41 carloads went out and it is expected that about 25 carloads will be the daily output until the season closes. Fruit also goes to New York by steamboat and every night the docks are piled high with barrels of fruit. Germantown is the location of a flourishing Grange and a coöperative society organized under the State law.

HEALTH LEAGUES.—One of the outcomes of the convention of state sanitary Officers at Saratoga recently was the plan for lay public health leagues to co-operate with the State Department of Health. These league organizations will be along the same lines as the local committees of the State Charities' Aid Society. Montgomery E. Leary of Rochester was elected president of the State Sanitary Officers' Association.

VACCINATE OR QUIT.—This is the substance of an order from the Department of Education requiring that pupils must be vaccinated on entering school and the law leaves the local school boards no recourse in the matter. Removal from office, without appeal, and civil suits for damages face those school officials who do not enforce the law. The opposition to vaccination in some sections of the State has reached quite virulent proportions. In Gloversville and Mechanicsville candidates for school boards have to run on pro-vaccination and anti-vaccination platforms. In the former place the antis won and the vaccination question was taken at once to the Department of Education, in Albany. They were told that the Department had no alternative but to enforce the law and that members of school boards were personally liable for the amount the non-enforcement of the law would cause the State to withhold from the school funds, and in addition were liable to removal. The legality of compulsory vaccination was upheld in a decision of the Court of Appeals in June. The orders of the State department of education are to require pupils to be vaccinated, if they attend public schools. They may attend private schools but they must attend somewhere.

ST. LAWRENCE COUNTY FARM EXHIBITS.—The county farm bureau and the Pomona Grange of St. Lawrence County are arranging for an exhibit of corn and other field crops in connection wi h the meeting of the Pomona Gra ge in December. Prizes to the amount of $200 are in sight. Now a special feature will be a display of field crops made by any Grange or farmers' organization and also for the best collective exhibit of corn and corn products made by any district school.

J. W. D.

Canadian Fruit Report.

THE apple crop as a whole throughout the Dominion is large, and the fruit clean and of good size.

In the southern and western counties of Ontario apples are heavy. Fall and Winter varieties sizing up well and color excellent.

In the Ottawa and St. Lawrence valleys there will be a full crop of late varieties. McIntosh is light.

The crop of Nova Scotia is not heavy, but particularly free from scab and fungus.

The New Brunswick yield will be equal to any harvested in recent years, though in some sections the apples are small.

Prince Edward Island will have about 70 per cent. of a normal crop. Fall varieties being heavier than later sorts.

The Pacific coast has the largest yield in many years, but in the Okanagan and interior valleys, the fruit is scanty, though of good size.

Pears in Ontario, Nova Scotia and British Columbia are about three-fourths of last year's crop. British Columbia has a large yield of plums, Ontario about 25 per cent. of full crop.

The peach crop of Ontario was a failure. British Columbia had a large yield. The Niagara section there will have a full crop of grapes.

Government Weather and Crop Notes.

OVER the greater part of the corn belt weather has been favorable for maturing late plantings, and the entire crop is now safe from frost. Cutting is progressing rapidly.

In the Winter wheat States the soil is mainly in good condition for plowing and sowing, and rapid progress is being made. Some early growings are up, but rain is needed in many localities to hasten germination.

In the Spring wheat belt weather has been favorable for thrashing in the eastern portions, but delayed by rains in the western.

In the Southern States cotton picking is progressing well, except in parts of the Carolinas, Georgia and Florida, where it is too wet.

Drought persists in the Atlantic and Middle States, delaying Fall plowing and pinching pastures. Pasturage in the Central and Southwestern States continues good and rains and cool weather on the Pacific slope have improved pastures, while delaying hop and fruit drying.

World Crops.

THE International Institute of Agriculture gives the total production of wheat in the following countries at 2,604,000,000 bushels, or 92.8 per cent. of last year's crop: Hungary, Belgium, Spain, United Kingdom, Italy, Luxemburg, Netherlands, Russia in Europe, Switzerland, Canada, Denmark, United States, India, Japan, Tunis and Constantine Province in Algeria.

Barley production for the above named countries, omitting India, is estimated at 1,071,000,000 bushels, or 90.9 per cent. of last year, and the oats crop of the countries named, omitting India and Japan, is 2,779,000,000 bushels, being 87.7 per cent. of last year.

The total rye crop in the following countries is 1,488,000,000 bushels, or 93.1 per cent. of last year: Prussia, Hungary, Belgium, Spain, Italy, Luxemburg, Netherlands, Russia in Europe, Switzerland, United Kingdom, Canada, Denmark and and Constantine Province in Algeria.

Woman and the Home

From Day to Day

IN WHITE AGAIN.

The world shall walk in white again,
  The garments of its crimson stain
Shall vanish in the love of men
  That turns them unto snow again.
Before the cannon dreams shall dance,
  And girls in grace make sweet
The furrows where the battle's lance
  Flashed in its splendid heat.

The shadows of old war shall pass,
  And life with laughter flow;
There is no crimson on the grass
  From battles long ago.
There is no smoke and flame of wrath
  Where men went down in death;
Above the trench a winding path
  Blows sweet with wildwood breath.

Oh, yes, the mighty heart of time
  Shall beat with joy and youth;
Old wars as a forgotten crime
  Grow dim in days of truth.
Fair shall the legions be that come
  O'er many lovely miles
To kiss with silence every drum
  And deck the days with smiles.
—Baltimore Sun.

*

LOGANBERRY juice is now put up commercially in Oregon; it is non-alcoholic, like unfermented grape juice, and is said to make a delicious drink diluted with two parts of water. We wonder whether any of our readers put up blackberry and raspberry juice in this way? We have only preserved raspberry juice in the form of raspberry vinegar, which makes a refreshing beverage either hot or cold.

*

GOING through a country district "up-State" we were shocked to see the remains of an old four-post mahogany bed which had been cut in two and made into porch seats. We have so much respect for old mahogany that this seemed desecration. However, there is no reason why an old bedstead of common wood should not be transformed into a settle for the porch, the headboard forming the back, and the posts with part of the foot forming ends. The seat is made by laying slats across at the proper height. Painted a nice color, olive or willow green, brown or gray, with colored cushions, such a settle is very attractive, as well as comfortable.

*

AN old-time Southern huckleberry cake calls for a cup of butter, two cups of sugar, three cups of flour, five eggs, one cup of sweet milk, one teaspoonful of soda dissolved in hot water, one teaspoonful each of nutmeg and cinnamon, one quart of ripe fresh huckleberries (some call them blueberries). Stir the butter and sugar to a cream, add the beaten yolks of eggs, then the milk, the flour and spice, the egg whites beaten stiff, the soda. The huckleberries should be heavily dredged with flour and stirred in last of all with a wooden mixer; be careful not to break them. Bake in a loaf.

*

A RECENT newspaper cartoon depicted two disgusted small boys talking about the war news. "Paw says it'll change th' hull map o' Europe," observes Jimmy bitterly, "an' when school begins teacher'll make us learn it all over again!" There is one point in which we all have to revise our geography; we must remember that St. Petersburg has ceased to exist, and that the capital of Russia is Petrograd, the German name given by Peter the Great being altered by imperial ukase to its Russian equivalent.

*

HERE is the woman's side of war, as expressed by Olive Schreiner in "Woman and Labor":

Men have made boomerangs, bows, swords or guns with which to destroy one another; we have made the men who destroyed and were destroyed! We have in all ages produced, at an enormous cost, the primal munition of war, without which no other would exist. There is no battlefield on earth, nor ever has been, howsoever covered with slain, which it has not cost the women of the race more in actual bloodshed and anguish to supply than it has cost the men who lie there. We pay the first cost on all human life.

Canning Grapes Without Sugar.

IN looking over the woman's page, I saw an inquiry about canning grapes without sugar. I have canned grapes without sugar for three years, and never lost a can, and this year there is surely more of an incentive than ever for doing it. As we do not like the seeds in the grapes, I separate the pulp and skins, boil the pulp and put through a colander; then add to the skins and boil about five minutes before putting in the cans, which have been thoroughly sterilized. I always use a self-sealing jar which has a brass cap with the rubber attached, and is put on by simply pressing down on can. I am very much interested in the woman's page, getting a great deal of help from it, and hope this information may help someone else. MRS. R. B. P.

Seen in New York Shops.

SOME new redingote coats shown are of sand-colored covert cloth, and it seems possible that the former style of separate covert cloth coats will come in again.

Some pretty tailored waists were of natural colored pongee. They had raglan sleeves with cuffs of white habutai silk, and a standing collar of the same, which ran down to a point in front. This makes a very serviceable waist.

Two complete changes in collars are the square neck and the high plain stock. Some of the new waists and blouses have the high stock collars, which will be a welcome change from the low necks of last Winter. As seen so far they are quite plain, usually of satin, with a deep turnover collar of white organdie which opens in the front and does not lie quite flat against the stock. The style of collar seen with the square neck is shown in the basque pattern on page 1110. The stock collars seen so far are all quite plain and very high. There are many variations of the Napoleonic collar called l'Aiglon, which is high and close in the back, open in front with revers below, sometimes of linen or organdie, and sometimes of cloth or satin.

Wide-brimmed picture hats are promised for the coming season, but very small hats are in the majority at present. One small military turban shown at an opening was plain and rather high, without a brim, giving a Cossack effect; the crown was black velvet, and the hat was edged with a broad band of black monkey fur. Directly in front, standing straight up, was a narrow jet quill, almost like a spear, giving a very military effect. It is many years since black monkey fur was fashionable, but it is now "in" once more, and is used in millinery and dress trimming, as well as for fur sets. Some long redingotes are trimmed around the bottom, sleeves and collar with black monkey. This fur is very lustrous jet black, but not as becoming around the neck as a fluffier fur—it is rather "slinky" in effect.

A pretty Fall gown that was practical as well as stylish had a long waisted basque and tunic of dark plaid serge with long sleeves, underskirt and sash of black satin. The neck and cuffs were finished with white grosgrain pleatings, and there were tiny jet buttons down the front of the basque.

It is generally predicted that dark or subdued colors will be in the lead the coming season, and this is very probable, for half Europe will be in mourning and fashions generally will consult serious taste. A great deal of black is already in evidence. There are also combinations of dove gray or taupe with marine or sapphire blue, which are quite new and becoming, and yet have a soft effect. One example was a basque dress of the moyen-age type with underblouse and skirt of dove-colored satin, while the long tunic and sleeveless basque were of marine blue gabardine. Braiding appears to be very popular; soutache braiding is seen on redingotes and basques, and many coats are bound with silk braid.

Displays of table silver, whether solid or plated, always include new styles of ideas in serving utensils; some are real conveniences, others mere matters of display. Among conveniences are tomato servers, which have a round perfectly flat bowl, if one may use the term, of pierced silver, pointed around the edge. Sliced tomato has a great knack for sliding off a salad fork, but can be helped conveniently with this server. It is also convenient for serving baked apples or tomatoes, fish cakes or fritters. These were offered, in triple plate, for 50 cents in a sale, but they are usually a little more expensive. Lemon forks, which are little long-tined slender forks, meant for serving sliced lemon with tea, are also handy for butter balls or olives. Pie knives, with broad flat trowel-like blades, would be appreciated by women whose flaky fruit pies are the favorite family dessert. In triple plate they are 50 cents in a special sale, and go up to $2.50 to $4 for solid silver.

Babies' sweater sets in brushed wool—the fuzzy wool often called angora, though this name is not correct—cost $5 for a four-piece set of sweater, leggings, cap and mittens. They are brown, tan, gray or white, and make the little one look like a cherubic brownie. Three-piece sets of sweater, leggings and cap in red, white or oxford worsted are $3. The sizes are two to six years.

Chili Sauce.

COULD you publish a good recipe for chili sauce? MRS. S. M. N.

We have used the following recipe for chili sauce for many years; it is the one given in the Rural Cook Book: Peel and chop fine one onion, and six large tomatoes, add one green sweet Spanish pepper and one small hot chili pepper, chopped; then season with one cupful of vinegar, one tablespoonful salt, two teaspoonfuls brown sugar, one teaspoonful each of ground ginger, cinnamon, cloves and black pepper, and half a nutmeg. Boil slowly until very thoroughly cooked, then bottle and seal when cold.

Cooked Piccalilli.

WILL you repeat a recipe given, several years ago, for a cooked piccalilli made from sweet peppers and onions? M. T.

This recipe calls for 25 large sweet peppers, half green and half red; 18 medium-sized white onions; one quart of vinegar; 1½ cup, good measure, of light brown or granulated sugar; one tablespoonful salt. Peel the onions, remove seeds and stems from peppers and chop fine; this is quickly done with the meat chopper. Put all ingredients together in a preserving kettle, and boil slowly for half an hour, or longer if needed to cook soft; seal in small jars. This is very good.

New Walls
Every Time You
Wipe Them

Use Lu-Co-Flat on your walls instead of wall paper or calcimine. Your walls then can be wiped off with a damp cloth and made like new, thoroughly erasing all finger marks and dirt from smoke, steam or other causes.

It gives the wall a soft, velvety, rich tone, restful to the eyes, and lasts for years.

Lu-co-Flat

is sanitary and hygienic. Dries uniformly. Is unaffected by steam, moisture and smoke. Does not cake in the can. Is extremely durable, beautiful and very artistic.

Finish your walls with Lu-Co-Flat, also freshen up your furniture, floors, stoves with Lucas Home Helps. Both are Lucas quality products, the result of 65 years' experience.

Mrs. Disappointed:—Anty Drudge, I wish you could cast a vote for me at the club this afternoon. I specially wanted to go, but I couldn't get through my washing in time, because the fire went out, and I couldn't get hot water until I made it again. I'm so disappointed.

Anty Drudge:—Poor child! I'm sorry. But let this be a lesson to you to keep a box of Fels-Naptha Soap on hand. You don't need hot water when you use Fels-Naptha Soap, and it does your work twice as quickly and easily.

Fels-Naptha Soap keeps the work from piling up. It gives you time to rest or go visiting. Saves the expense and the discomfort of a hot fire. Washes clothes perfectly in cool or lukewarm water, dissolves grease, takes out stains, even stubborn blood stains, and does your work in less than half the time, with less than half the trouble.

"It's mighty convenient to have a box or carton of Fels-Naptha always on hand.

Full directions are on the Red and Green wrapper.

Fels & Co., Philadelphia

FELS-NAPTHA

The Rural Patterns.

In ordering patterns please give number of pattern, and size desired. Price of each pattern 10 cents.

8313, Girl's dress. Cut in sizes 4, 6 and 8 years. Size 6 requires 1⅞ yards 27, 36 or 44-inch material for blouse and 1⅛ yards 27 or 36 for skirt and trimming. 8237, Boy's suit. Cut in sizes 4, 6 and 8 years. Size 6 requires 1½ yards

of 27 or 36-inch material for blouse and ⅞ yard 44 for trousers, and trimming. 8280a, Boy's Norfolk coat. Cut in sizes 4 to 10 years. Cut in sizes 14, 16 and 18 years. Size 16 requires 3½ yards of 36-inch material.

Canning Fruit With Little or No Sugar.

WHILE sugar is a very important article of food, it is a highly concentrated one, and with our love for all kinds of sweets, we are often tempted to use more of this carbohydrate than the system can readily take care of. I think I can safely say that in no other country is sugar used so extensively as we Americans use it, and we all suffer, more or less, from this erroneous and expensive habit. "But how can we do up our fruits for Winter use without sugar?" the busy housewife stops to ask. Why, easily enough. If the mildly acid fruits are perfectly ripened they will be sweet enough for the "unperverted palate," and the perverted one can easily be educated in this direction, or, they can be sweetened to suit individual taste on using. If our fruits come to us, as they more often do when bought from a market, a little underripe, you have only to add just enough sugar as will make them as sweet as when fully ripened. Any fruit hygienically put up and sealed will keep indefinitely without sugar.

In some of the following recipes, apples, peaches, pears, and grapes are put up without the addition of a grain of sugar, while the more tart varieties have a very small amount added. The general directions for canning fruit are so well known to most of you it will not be necessary for me to go into detail as to the necessity of perfect cans and rubbers, and their sterilization, as well as the other utensils used in the process.

Peaches.—Choose only the best, but not too ripe fruit, they should be firm to the touch. Peel thinly, then divide each peach into halves, and remove one-half of the pits. Put into a porcelain or granite preserving kettle, and add one quart of cold water to every six quarts of the prepared peaches; bring gradually to the boiling point, then can and seal at once.

Pears.—The tart varieties are best for canning even though no sugar is used. Peel thin, halve, and core, dropping each prepared piece into cold water, to which a little lemon juice or vinegar has been added, to keep them from discoloring, then drain, and add one quart of cold water to every seven or eight quarts of the fruit. Bring slowly to a boil, and let simmer gently until tender without being broken, and can.

Grapes.—Take grapes fully ripened, and if possible fresh from the vines. Separate from the stems, rejecting the defective ones, wash, and drain. Remove the skins from the pulp, and press the pulp through a sieve to extract the seeds. Put skins and pulp together in the preserving kettle, allowing two quarts of water to every six quarts of grapes; bring slowly to a boil, skim if necessary, then simmer them eight or 10 minutes, and can.

For grape juice cook stemmed grapes with one-third as much water as you have of the stemmed fruit. Bring gradually to a boil and cook slowly until the seeds separate from the pulp, then press through a cheese-cloth. Heat again slowly, and when boiling hot, skim, and put into cans or bottles, and seal.

Apples.—Select red apples of a fine sub-acid flavor, and wipe, but do not peel. Remove any defective spots, and divide into quarters, core, and cut each piece into fourths, then add just enough cold water to make them juicy, and heat and cook slowly until tender, with each piece whole, and the juice clear. The skins add much to the flavor and coloring of this preserve. Lift carefully into cans while hot, and seal.

Quinces and apples.—Take equal quantities of quinces and sweet apples, or two parts apples and one of quince. Wash and peel the fruit, then halve and core, cut the apples into fourths, and slice the quince thinly, as it takes longer to cook the latter than the apples. Put a layer of the quince in the bottom of the kettle, and follow this with one of apples, and continue the layers alternatingly until the fruit is used, then add enough cold water to half cover them, and cook slowly until tender. Can the same as apples.

Plums.—For the green or blue gages, allow three pints of water and one cupful of sugar for six quarts of fruit. Heat them slowly, then add the sugar, and cook gently for five or six minutes, this fruit should be rather hard, else they will cook to pieces. For the damsons, use two quarts of water to four and one-half quarts of the fruit, and two cupfuls of sugar, and cook slowly for 10 minutes.

Huckleberries.—Pick over and wash the fruit carefully, then put in the kettle with just enough cold water to keep them from burning, and cook slowly until soft, stirring occasionally.

Cranberries.—Pick over the fruit carefully rejecting all the soft ones and those affected with dry rot. Then wash and drain. Allow three parts of cold water to two quarts of the berries, and cook slowly for 15 or 20 minutes, skimming whenever it is necessary, then add one cupful of sugar, cook a little longer, and can. If the fruit is very ripe less sugar will be needed, and a little more water may be added. ROSAMOND LAMPMAN.

Tested and Tried.

Graham Fruit Bread.—Two cups graham flour, one cup white flour, one cup sour milk, one teaspoon soda, two teaspoons each of brown sugar and molasses, one teaspoon of salt and one-half cup each of chopped nuts and seeded raisins, dates or prunes, cut in bits. Bake slowly almost an hour.

Rice Bread.—One cup each of cold boiled rice, white Indian meal, wheat flour and milk. One egg, two teaspoons of baking powder, half teaspoon salt and a tablespoon of melted butter. Mix dry ingredients, and the egg beaten with the milk and lastly the melted butter. Bake in moderate oven. This is very nice baked in muffin rings and eaten hot, pulled apart and buttered.

Beauregard Eggs.—Cover three eggs with boiling water, and keep the latter at simmering point for three-quarters of an hour, then cool and shell the eggs. Chop the whites quite fine. Make a sauce with one cupful of milk, one tablespoonful of flour mixed to a paste with a little cold milk, and one-third of a teaspoonful of salt. Add the chopped whites and one scant teaspoonful of butter, and simmer for 10 minutes. Toast and cut into triangles several slices of bread. Arrange on a hot dish, pour over the sauce and rub the yolks through a strainer, letting them cover the sauce. If desirable, garnish with a pinch of chopped parsley.

Savory Beef Roll.—Select the piece of meat called the inside flank, wipe it with a damp cloth, remove the skin and fat and lay it out flat on the bread board. Place in a mixing bowl a cupful of grated bread crumbs, add one teaspoonful of onion juice, one scant teaspoonful of salt, one teaspoonful of chopped celery tops, a sprinkling of paprika and a tablespoonful of melted butter. Mix well and spread evenly over the meat; roll it up, tucking in the ends, and tie securely in shape with twine. Slice into the bottom of a baking pan one white onion, two small carrots, a stalk of celery and a small turnip; place the meat upon the vegetables, lay on top three slices of bacon and pour into the pan two cupfuls of soup stock. Cover the baking pan closely and cook very slowly for about four hours, basting frequently. When cooked, season the gravy in the pan with a few drops of kitchen bouquet and thicken with a tablespoonful of brown roux. Pour the gravy over the meat and garnish with a few crisp celery tops. Long, slow cooking is essential to the success of this dish, for if cooked too fast it will not be good.

Fine for Dairy Farms

We sell a great many Pilot Lighting Plants to dairy farmers. Because dairy farmers can get even more out of an Acetylene installation than anybody else.

Our Dairy farmer patrons make these Acetylene plants do double work. They run an extra line of pipe to each barn—and sometimes to other outbuildings. In these buildings they fasten the great balls of Acetylene light to timbers or rafters.

They also equip these lights with ignition devices—to make them light with the pull of a chain without matches.

Two of these Acetylene barn lights will make a big dairy barn as light as day. They will give more light than a dozen lanterns—and unlike lanterns, they cannot be tipped over.

The same is true of Acetylene house lights. They burn in handsome stationary bronze or brass fixtures securely fastened to ceilings or walls.

Acetylene is too, a double boon to the women folks. In addition to the beauty of the light, it brings even a greater convenience in the gas cooking stove.

For Acetylene is used in gas cooking ranges in thousands of country homes, just as city gas is used in millions of city homes.

In all of these homes the gas range has shortened cooking hours and has done away with the drudgery of handling coal, wood and ashes.

Pilot Acetylene Generators are the most widely sold light and fuel plants in the world.

Our advertising literature tells why they are safe, reliable and trouble proof. Write to

Live Stock and Dairy

FEEDING WINTER LAMBS.

Advice From An Expert.

"WE should have a margin of two cents between the price we pay for lambs in Chicago, and the price for which we sell them in Buffalo," is the assertion made by Mortimer Tyler of Hillsdale County, Michigan. "For the practice of feeding to be lifted from one in which there is uncertainty, we must buy lambs in Chicago at six cents, then sell them in Buffalo at eight cents, and then we can pay for interest on investment, labor, use of equipment, possible loss among the lambs, insurance on our stock and buildings, farm improvements and besides have a profit. These are charges which the business man figures against his investments, and the farmer should do so in his business. Too many farmers have gone in buying lambs blindly on the basis that manure pays for labor, that increased weight pays for feed, interest on the loan at the bank, and possible loss."

Mr. Tyler added: "I have not always quite lived up to my own advice, for last year I paid $6.65 for the first lambs with which I started, and they were sold in Buffalo from $7.90 to $8.50. Many farmers wonder if it would not pay to buy in Omaha or the ranches of Idaho and Montana or Eastern Oregon. If lambs are 35 or 40 cents lower in Omaha than Chicago, I would then advise buying in Chicago, for there is a five pound shrinkage between the two cities, and one feed bill, while from Chicago to points in Southern Michigan there is no feed bill, and small additional shrinkage. There are times when lambs might be enough cheaper in Omaha to pay, and times they sell at as much as in Chicago.

"I would not advise the farmer to go to the far West to buy, although I have bought on the ranges at $3.25 the head delivered at cars, but the trip from home, the time from the farm, the long ride of 50, 60 or 70 miles from one ranch to another, all charged in dollars and cents together with freight, insurance, shrinkage, feed bills, personal incidentals added to the cost of the lambs, make the Chicago bought stock the better investment. It requires about 10 days to two weeks to ship to Chicago, and although I have bought as high as 5,000 lambs in one place, a 150-mile horseback ride among the mountains away from the railroad, with horse hire and some expenses, induce me to advise relying on one of the commission firms which has a reputation of honesty. The feeder can place his order with his firm, describing the stock he wants. He can limit them in price, and they will take care of the purchase as well as the buyer could personally.

"I advise the western lamb, for it is more hardy, free from worms and is desired in the market. A farmer may think that he could select a bunch of culls and make a good thing on them. In my purchases I find some smaller lambs, and these I have placed by themselves, fed them the same ration day after day, as I did the heavier lambs, and when ready for sale they were 12 or 15 pounds lighter than their better companions. Culls are profitless. But keep the small lamb separate from the others, for you are apt to get some small ones in a carload, and the larger ones crowd the weaker ones away from the feed trough.

"Feeders commence buying lambs as early as the first of August. It pays if one has pasture. I have secured 12 pounds gain on pasture, and the ordinary price paid the head for pasture is 1½ to two cents, although I have secured good pasture as low as one cent a week. I have had them gain two to three pounds weekly, yet 1½ or two pounds is good gain the week.

"The silo plays an important part in our feeding. We feed silage once a day inside, and that is in the evening. The sheep will consume their evening meal in 15 or 20 minutes and then lie down. We feed about 1½ pounds of silage the head to the feed, and on it we sprinkle cottonseed meal. We start feeding the cottonseed at the rate of half an ounce the lamb and increase to two ounces. Cottonseed costs about the same as oil meal, and contains more protein. In the morning we feed shelled corn in the buildings, and Alfalfa hay or clover hay outside in racks. I have started with one-fourth pound of shelled corn and have completed the feed with 1¾ pound a head. We give all the hay they will clean up nicely. At first, apparently, they cannot be given sufficient. This is good for it gives them capacity. I like to feed straw once a week. They eat it as ravenously as they would hay. Cornstalks also are very good, and many of the farmers are using corn stalks in their feeding.

"Many feeders are looking for gain in pounds and forget the real profit lies in economical increase in weight. One of the things to be remembered in securing this gain at a nominal cost is to feed the lambs regularly. They cannot, however, be fed before daylight in the morning nor after dark at night, but should be fed in the evening in time to complete their evening meal before dark.

"We keep the lambs outside each day part of the time except when it rains. The cold dry air is a natural condition for lambs, but they should not be exposed to rain. Snow does not hurt them, for they will readily shake it off. The pens or buildings in which the lambs are kept should be well ventilated. One farmer tells me some lambs did best in a shed with two open ends, while others kept in a warm basement did not show near the gains. The lambs should have access to good fresh water, and they should be kept dry under foot. The farmer need not hesitate fearing disease, for shipments are carefully inspected. Scab sometimes breaks out but the chances are very small, sheep this side of the Rockies are generally apt to be infected with stomach worms, while the mountain range lambs are free from worms."

There are some men who will succeed, for they are natural feeders, they like stock, and stock thrives in their hands, while others feed any time, they have thin horses, poor hogs and thin live stock about them. Such a man will fail feeding lambs. Now, here is another thing, feed for a definite time, have your lambs finished and sell them at that time. If your lambs go in the middle of November and you feed with the view of finishing them the 15th of January, and should carry them to the first of April there would be no profit. There is a possibility of the lambs going back. Of course market conditions might demand holding the lambs a week or two weeks, but to carry them along at other than loss is almost impossible. W. J.

"SHALL we take a few Summer boarders this year?" said Farmer Corntossel. "I don't know," replied his wife. "Summer boarders are kind of in the way. But they do help some in drawin' the mosquitoes away from the kitchen around to the front porch."—Washington Star.

Dressings for Wounds of Animals.

THE Department of Agriculture gives a list of dressings which may be used on wounds to prevent flies from laying their eggs or carrying infection to the sores. Jensen gives three formulas of repellents for application to wounds:

Formula No. 1:
Oil of tar ..... 8 ounces
Cottonseed oil to make ..... 32 ounces

Formula No. 2:
Powdered naphthalin ..... 2 ounces
Hydrous wool fat ..... 14 ounces
Mix into an ointment.

Formula No. 3:
Coal tar ..... 12 ounces
Carbon disulphid ..... 4 ounces
Mix; keep in a well-stoppered bottle and apply with a brush.

Another ointment widely used at the South is:
Oil of turpentine ..... 1 dram
Phenol ..... 1 dram
Cottonseed oil to make ..... 4 ounces
Mix and apply freely to wounds.

A Live-stock Association.

THE North Dakota Experiment Station tells of an association formed at Esmond, in that State for improving the stock in Benson County. Already 19 purebred bulls have been brought into the county. Seventeen of these are milking Shorthorns and two are Holsteins. The plan is this:—eight farmers living near together form a local club. Each one puts up $20, which is turned into the parent association, which in turn furnishes the local club with the kind of a bull it wants. The call has, in nearly every case, been for the milking Shorthorns. One of the members of the club keeps the bull and receives $30 a year for this. A service fee of one dollar is charged members and non-members are charged $3. This provides for the running expenses. When the bull has been used two or three years he is exchanged for another, in this way inbreeding is prevented. The local club must keep on using the same breed, as the association does not believe in the mixture of breeds. Considerable improvement has already been made in the live-stock of these localities. It is the aim of the association to have four local clubs in each township of the county. This is one of the best organizations of its kind in the State. Its method of organization is securing results. It will not be long before the cattle of Benson County will be well graded up and will have the appearance of purebreds as well as their good qualities in production.

Cortland Dairymen Meet.

DISSATISFIED with the prices that are being received for milk the dairymen of Cortland and Homer, two of the largest milk-producing sections of the State, met Sept. 12 to consider the question in response to a call from the State Secretary of the Dairymen's League, Albert Manning. The League sent a committee to New York August 24 to confer with the dealers and if possible to prepare a schedule of prices to be in effect from Oct. 1 to April 1. The present price is $1.40 a can of 85 pounds, just the same as that received a year ago, although the cost of feed is very much higher. The conference in August was a failure, the Bordens refusing to recognize the demands of the milk producers and the smaller dealers taking the same stand. Building local plants for handling milk in emergencies is strongly urged by the League and the farmers are rousing to the need of concerted action. The highest price ever received here for milk was $1.70 per can of 40 quarts of which 10 cents per can was paid for drawing, and this price held but for one month. When this maximum price of four cents a quart is compared to the retail price in New York it will be seen who furnishes the labor and the capital and who secures the greater part of the profits.

Ralph Butler, president of the Homer branch, was elected as a delegate to represent both Homer and Cortland at the Albany meeting. Prices were named all the way from $1.70 to $2 per can as what the producers considered their due. On Sept. 15 the Bordens named their prices throughout the district to prevail the next six months. They are the same as last year, and are as follows for grade B milk which is the grade produced in this locality: October $1.70 to $1.90 per 100 pounds; November $1.80 to $2; December $1.80 to $2; January $1.75 to $1.95; February $1.65 to $1.85; March $1.60 to $1.80. The first figures are the minimum and the second the maximum prices. The maximum depends on butterfat, plant and equipment. The butterfat must be at least 3.8 and the scoring at least 68%, 25% on plant and 43.7 on method. The company, as usual, agrees to make an adjustment of prices if conditions warrant.

The Dairymen's League controls the output of 185,000 cows, or 75% of the entire milk supply of New York City. The Cortland branch alone has about 90 members and controls 1,147 cows. After the meeting in Albany active efforts will be made to get as many cows as possible under the agreement whereby their milk will be held by their owners until such a time as the producers shall secure a more reasonable price for their product. To this end other meetings of local branches will be called directly after the Albany meeting. E. G. F.

DAIRY CATTLE

Holstein-Friesian Bull Calves For Sale—Write for special offer. THE GATES HOMESTEAD FARM, Chittenango, N. Y.

FOR SALE

Office, 50 Clinton Ave.

Purebred Registered
HOLSTEIN CATTLE
The Chief of Dairy Husbandry at University of Illinois Agricultural Experiment Station says: "A scrub bull is the most expensive and extravagant piece of cattle flesh on any farm." At the June sale of purebred registered Holstein cattle at Chicago, nineteen bulls were sold at an average of $1,750 each. Leaving out the record breaking $20,000 calf, the remaining eighteen bulls brought an average of $755 each. Pretty good evidence for you to consider.

Day after Day, Year after Year,
PRODUCTION COUNTS
It is not what a cow can produce in 7, 14, or 30 days, even in a year that determines her value to the farmer, it is what she can do in a lifetime.
Brown Swiss Cows rank high in average production and are regular and persistent breeders and producers. Year in, year out, they make good records and raise good calves without any coaxing or pampering. If interested, we will send you an Illustrated booklet.
The Brown Swiss Cattle Association
IRA INMAN, Secretary BELOIT, WISCONSIN

NEW ENGLAND MILK CONDITIONS.

AS the time draws near for making the milk prices for the coming season much speculation is apparent, and also much anxiety as to what the price will be. Conditions are bad any way you look at it. Massachusetts milk is in light supply, and probably will remain so a while longer, as other lines of farming look better to the majority of farmers and milk producers. Boston milk authorities have not been fair in the general policy of sampling milk this Summer, laying on the producers what should have been blamed to the handlers and contractors in some cases, which has caused hard feelings that will last for some time. The contractors have also been unfair in many ways, especially in regard to prices, which have been low, and no offers of raise have we heard, while the cost of production has been steadily increasing the last few months. The producers are making an effort to keep the supply normal, but are letting the cows give what they will and letting it go at that, and you cannot blame them, as no encouragement to keep the supply up or increase it is in sight. I doubt if the contractors will be willing to give a raise in price that will help or improve matters very much, or will make any offer at all for over two or three months. The price should be made for a year, is the general belief among producers, but I see no hopes of this being brought about at present. These conditions exist in Massachusetts and probably to quite an extent in our neighboring States also, and milk producers are turning to fruit growing or beef raising or poultry farming or combinations of these, and making much better returns than formerly while depending on market milk as the chief source of income.

I will state one example in regard to this change, a certain father and son living in central New Hampshire, the latter a graduate from agricultural college, while the father is a man of common sense and good judgment, and also a believer in up-to-date practices of conducting farm business. These people formerly kept about 40 dairy cows and sold milk to a Boston contractor, getting an income from the same of about $5,000 per year without deducting expenses. Not being satisfied they desired to try beef production and hogs. They decided to begin right and got a few purebred Herefords, and have built up a business that now returns them more than double their former income, or about an average of $12,000 yearly, from sales of beef and purebred stock. Any animal not about perfect is sold as beef, only the best are sold as breeders. These cattle are pasture-fed in Summer and barn-fed in Winter with good hay and a small grain ration, mainly to keep up a steady growth. Clover hay is considered much the best feed for good results. The calves are allowed to suck the cows as long as they give milk, and in some cases if the mother does not give enough another common cow is bought to supply the deficiency and yearlings weighing 1200 and 1500 pounds are the result. Under this system, as no milking is required, one man can do the stable work easily and not be tied down to certain hours, as is the case in dairy farming. These people believe that New England is an ideal breeding ground for purebred stock and that this cannot be overdone in beef cattle for some time to come, as they cannot supply anywhere near the demand they have for their stock, and the demand is growing owing partly to opening up of the South to cattle growing and dairying. While everyone who tries could not have perhaps the success of the above case, yet good returns can be made in this line of farming in the right localities where pasture is good, and the farmers are waking up to the fact.

One would naturally think if this change is going on the dairy business must improve, and it should and may, but as long as the contractors can draw on Canada freely as at present, and on other faraway sections when necessary to obtain milk to keep up the supply, and the milk authorities are paying more attention to harassing Massachusetts producers than looking out for the distant supply, it is doubtful whether conditions will improve enough to make it a paying proposition to produce good milk for Boston market. A. E. P.

LIVE STOCK BULLETINS.

DAIRY BARNS.—Bulletin No. 179 of the Kentucky Experiment Station at Lexington, discusses "The Construction and Equipment of Dairy Barns," and does it well. While naturally the discussion of the subject is mostly to Kentucky conditions, there is a general discussion of the subject, and pictures are given of some of the best dairy barns in the country. They are both exterior and interior views, thoroughly covering the subject of sheltering and fastening the cattle. There are also figures and specifications showing the course of different plans of barn building. A very practical bulletin, sure to be useful for dairymen.

COLOR OF HORSES.—Bulletin No. 180 from the Kentucky Station is an interesting discussion of "The Inheritance of Coat Colors in Horses." This bulletin takes up the scientific discussion of the horse colors, which are likely to result from certain experiments in breeding. It takes up the classes of colors which are found in the horse, and shows which colors are most fixed or permanent and how far these colors are likely to follow the sire or the dam in breeding. It is a very useful discussion, for as all know certain colors in horses are more desirable than others. It is also believed by a good many people that color in the horse indicates speed, intelligence, or other good traits. Most people for instance have heard it said that sorrels are always tough, whereas black horses are apt to be soft. Professor Anderson, who writes this bulletin, says that the color has practically nothing to do with intelligence, vigor, or speed. In other words, color is no indication of the real value of the horse but it is profitable for a breeder to know just what colors he is likely to produce by certain lines of breeding. This bulletin gives a detail of such matters so far as they have been worked out.

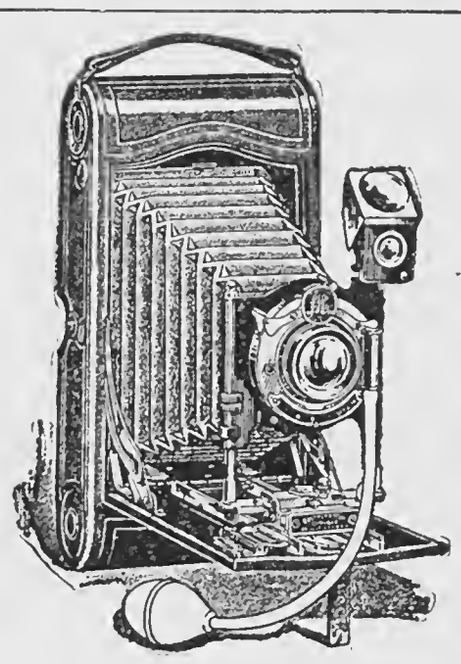
"STOCK CONDITIONS."—The Kentucky Experiment Station has issued Bulletin No. 181, a part of which discusses the disease known as "Hog Cholera." The scientific men all agree now that the only real remedy or preventive of this disease is through inoculation, and such sanitary measures as will keep the disease away from the herd. It is not possible by means of a tonic or so-called stock foods to keep the disease entirely away from the hogs, but there are certain drugs or substances which may keep the animal in good condition and better able to resist infection. This bulletin gives one of these combinations which it calls a conditioner. This mixture is made up as follows:

Common salt	15 pounds
Wood ashes	5 pounds
Wood charcoal	5 pounds
Powdered copperas (ferrous sulphate)	1 pound
Sodium sulphate	1 pound
Antimony sulphide	1 pound
Sulphur	1 pound
Sodium hyposulphite	1 pound
Air-slaked lime	1 pound

One ounce of this mixture is fed with about 40 pounds of feed, or what is better, the mixture is left in some safe place where the hogs can eat it as they desire.

Milk Business at Providence, R. I.

THERE is a great deal of uneasiness in Providence and vicinity in regard to the dairy business. September 1 the Board of Agriculture had a special session for dairy farmers, trying to find out from the dairymen themselves, what it costs to produce a quart of milk. No one could give a definite answer to that question, and in fact, it depends a great deal on the conditions under which every dairyman is working. But the outcome of the meeting left the impression that under present conditions, the dairyman was just about making both ends meet even selling milk at five cents a quart wholesale. Very few farmers raised calves, mostly for lack of room, every available space being taken for cows in milk. The custom in general is to keep a cow as long as she pays for her keep, or in other words, selling her to the butcher when her milk flow falls below six or seven quarts a day.



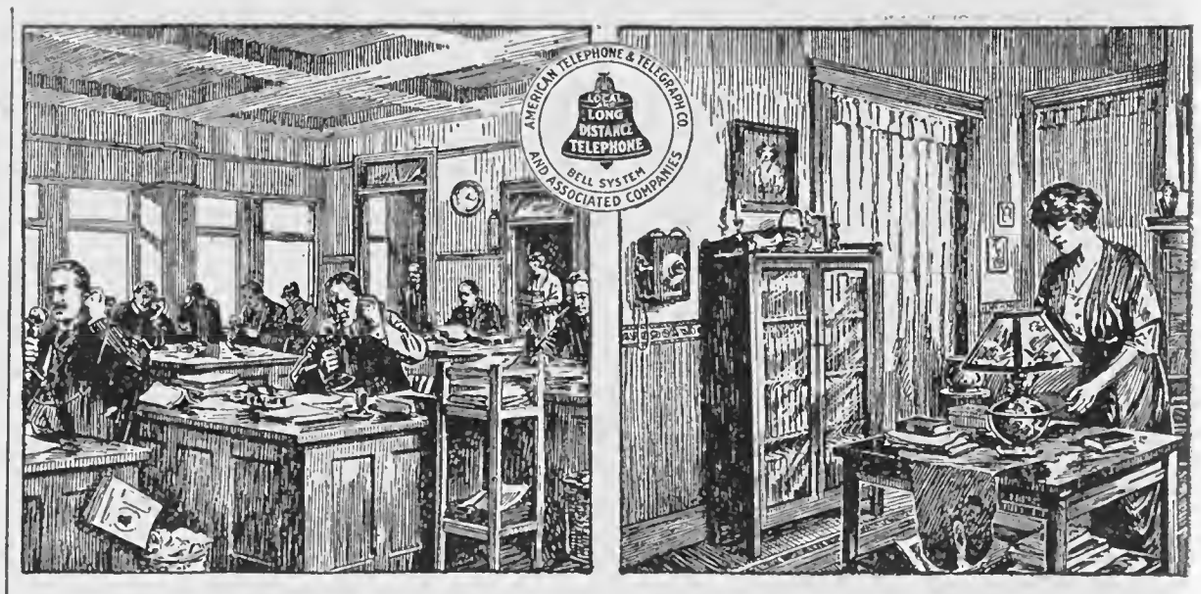
3A Folding Pocket
KODAK

A Pocket Camera—so simple that the beginner can make good pictures with it from the very start, even to the developing and printing. Capabilities that appeal to those who know photography in every detail. Made of aluminum, covered with fine seal grain leather. Has a superior rapid rectilinear lens and Kodak Ball Bearing shutter with automatic speed of 1-25, 1-50 and 1-100 of a second—also the "bulb" and time exposure action. Has reversible brilliant finder, two tripod sockets, rising and sliding front, automatic lock. Uses Kodak film cartridges, (can also be fitted for plates), loading in daylight for six or ten exposures. Is *right* in every *detail* of construction and finish. Pictures postcard size (3¼ x 5½). Price $20.00.

KODAKS $6.00 and up.

Ask your dealer, or write us for Kodak catalogue.

EASTMAN KODAK CO.,
387 State Street, ROCHESTER, N. Y.



Fair Play in Telephone Rates

IT is human nature to resent paying more than any one else and to demand cheap telephone service regardless of the cost of providing it.

But service at a uniform rate wouldn't be cheap.

It would simply mean that those making a few calls a day were paying for the service of the merchant or corporation handling hundreds of calls.

That wouldn't be fair, would it? No more so than that you should pay the same charge for a quart of milk as another pays for a gallon.

To be of the greatest usefulness, the telephone should reach every home, office and business place. To put it there, rates must be so graded that every person may have the kind of service he requires, at a rate he can easily afford.

Abroad, uniform rates have been tried by the government-owned systems and have so restricted the use of the telephone that it is of small value.

The great majority of Bell subscribers actually pay less than the average rate. There are a few who use the telephone in their business for their profit who pay according to their use, establishing an average rate higher than that paid by the majority of the subscribers.

To make a uniform rate would be increasing the price to the many for the benefit of the few.

All may have the service they require, at a price which is fair and reasonable for the use each makes of the telephone.

These are reasons why the United States has the cheapest and most efficient service and the largest number of telephones in the world.

Conditions in Southern Vermont.

FARMERS are inclined to decrease their herds and sell hay at $22 to $24 per ton in North Adams. Probably one of the reasons is the lack of purebred stock. In this vicinity the farms are nearly all small, keeping from six to 15 head, and they cannot afford to buy purebred bulls to head small herds. The majority would rather pay a 50-cent service fee for a scrub bull than pay $5 for one with a 25-pound backing. Club buying does not meet with much success. There was some effort made at one time to get four or five farmers together and buy a descendant of "King of the Pontiacs," but nothing came of it. Labor is high; we have to pay $2 a day for common farm labor, and then they don't want to milk. Not much grain is raised; none to my knowledge is sold out of town. Corn is nearly two cents a pound now, and other grains around $1.85 per hundred. Our crops are good this year. Farmers are using much chemicals now and many use them entirely for top-dressing meadows and find it profitable. All our milk is sold in North Adams at eight cents per quart retail. Those that sell at the farm to peddlers get from four to five cents per quart. Barns are inspected by Massachusetts inspectors, and there is very little trouble with them. Some farmers have butter and egg routes in North Adams and receive on an average about 35 cents per pound, and at present 38 cents for eggs. There is no trouble to find trade once they find your produce is of good quality. We find good cows are high, bringing $60 to $80 at auction.

Stamford, Vt. J. R. E.

Skim-Milk for Hogs.

THE Fairmount News figures the value of skim-milk for hogs in the following manner:

"You have five little pigs four weeks old. If these are weighed and are thrifty, they will average about 20 pounds apiece. Now consider, that you have at your disposal skim-milk sufficient to average 100 pounds per day for six months, or 180 days. When the pigs are young a small quantity of milk will be sufficient, but as they grow older a greater amount is needed, but the deductions should be on the average of 100 pounds for 180 days. If these pigs are turned upon a grass plot, and are supplied with this skim-milk in the proper way and amount they will weigh better than 200 pounds when six months old. If the 20 pounds, which they weighed at the time they were weaned is deducted from the 200 pounds, it will leave you 180 pounds gain for the 180 days fed, or actually one pound gain per day for each hog. Hence, if one hog will gain one pound per day, the five will equal five pounds of pork per day gained, and if this pork is worth eight cents per pound it will make the skim-milk net the farmer 40 cents per hundred.

"In addition thereto, if this half acre of ground is put into crops next year under good conditions, it will produce an increased return equal to 10 cents per hundred for the skim-milk fed. No argument is needed here to bring to the farmer's attention the value of hog manure as a fertilizer. Another feature, if this half acre will be used for green feeding crop for cattle, the amount of green feed produced after being used for hog pasture will greatly cut down the farmer's feed bill, and give him a much larger profit."

Value of Cow Testing.

THE Wisconsin College of Agriculture sums it up as follows:

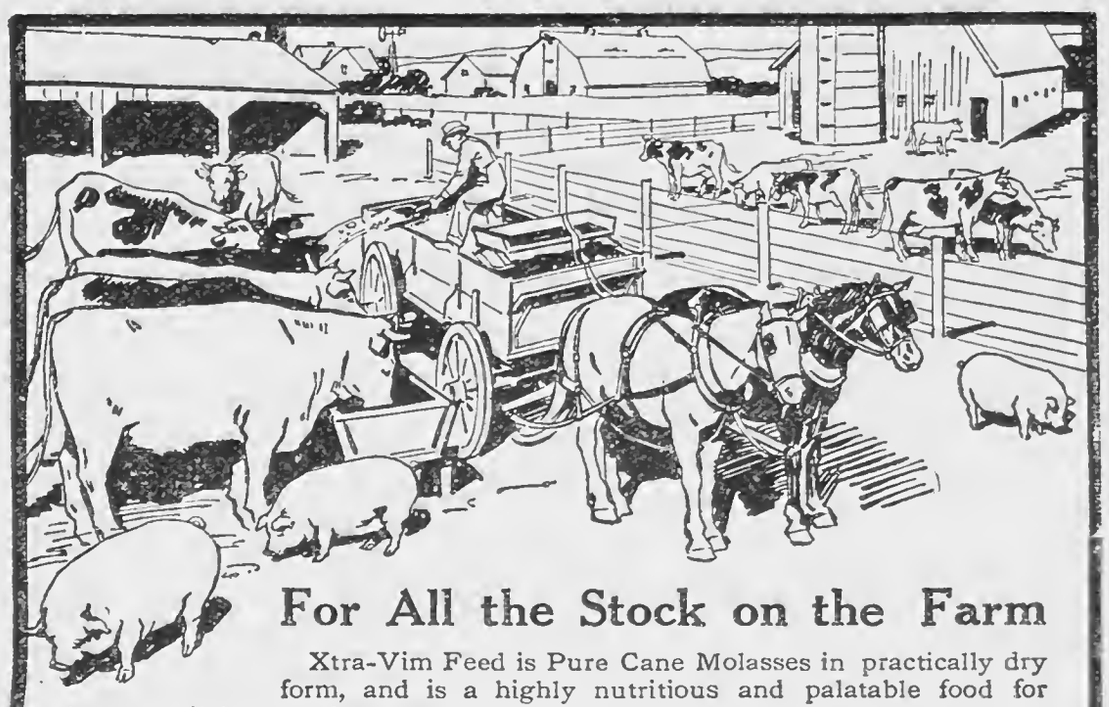
"Cow testing one shows the money makers. The best cows in many Wisconsin herds are returning a profit of $100 or more every year. It is possible to have every cow kept do as well.

"The loafers, the cows that consume more than they return, are quickly spotted and eliminated when the cow test is used. No successful merchant handles a line of goods on which he loses money; likewise, no progressive dairyman will milk a cow on which he does not make a profit. The milking of cows is a straight business proposition and no farmer can afford to spend his own time or pay high priced labor to milk cows which do not pay for their board. Let's make the $100 return per cow our standard.

"To build up a profitable herd the cow test is indispensable. It enables the dairyman to quickly get a high producing herd by selecting heifers from only the best cows. In this connection the sires that are capable of transmitting dairy quality and temperament to their offspring can be proven. The very general practice of sending mature bulls to the block, when they are just in their prime for breeding purposes, is detrimental to our dairy industry and should be stopped.

"Cow testing also pays because surplus stock of both sexes sells for higher prices when buyers can see what the ancestors of these animals have done in the line of milk and butter fat production.

"When using the test, farmers may know their cows as individuals and feed so as to get the greatest return for every dollar's worth of feed provided. The value of the silo in supplying fresh Summer succulence during the Winter months, and in helping out when pastures dry up in the Summer, is also shown best when cows are under test."



For All the Stock on the Farm

Xtra-Vim Feed is Pure Cane Molasses in practically dry form, and is a highly nutritious and palatable food for horses, milch cows, fat cattle, hogs and poultry.

Xtra-Vim is a 100% value feed, not a condition powder. It is high in energy production and takes the place of an equal amount of less palatable feeds or grains selling at war prices. It is not a laxative, but it aids digestion, tones up the stomach and eradicates worms. Used as part of daily ration, it will improve the appearance, health and general condition of all the stock.

XTRA-VIM FEED

in 100-lb. bags is not sticky. It is as easily fed as bran, and has no more waste. It is a very economical feed and gives results which cannot be duplicated by any other means at anywhere near so low a cost.

Write for Feeding Booklet and Prices

You should try out Xtra-Vim Feed by giving it as part of the daily ration to some of your stock. If your feed store does not carry Xtra-Vim Feed, get our prices direct to you. It probably costs less than you think. Send today.

XTRAVIM MOLASSES FEED CO., 30 Broad Street, Boston, Mass.

Must Suit You

You will never know the meaning of real engine economy and efficiency until you study the quiet, smooth, easy running features of

LAUSON FROST KING
Gasoline and Oil Engines

There are more drop forged and case hardened parts on Lauson Frost King Engines than any other. This means an engine as accurate in adjustment, and therefore as economical after five years' use as when new. The Lauson Frost King is **built up to a standard, not down to a price.** They cost a little more than some others to start with, but a great deal less in the long run. The Frost King trade-mark on an engine is a warranty of long, satisfactory service.

Guaranteed—We absolutely guarantee Lauson Frost King Engines to make good on every claim we make for them; also as to workmanship and material.

Write NOW for Free Book: "The Power that Backs the Modern Farmer" and name of nearest dealer who will be glad to give you a demonstration of the Frost King without obligation on your part. In writing us, state size engine you need.

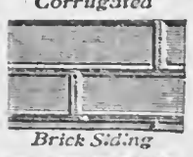
Lowest Prices Ever Made On World's Best Roofing

Edwards Patent "Grip Lock"

Corrugated



Brick Siding

Ceiling

Lightning-proof, Fire-proof, Rust-proof, Rot-proof, Galvanized Steel Roofing Lasts as Long as Building Stands

Once you have purchased and laid Edwards Tightcote Galvanized Steel Roofing your roofing expense for that building is at an end.

Its cost per square is the lowest ever made. It has *no* up-keep cost. Always beautiful in appearance. Reducing cost of insurance.

EDWARDS Exclusive Tightcote Process

Makes Rust-Proof Roofing. The zinc spelter becomes practically one piece with the steel. No ordinary galvanizing can compare with it. Each and every Edwards Metal Shingle, Metal Spanish Tile, each sheet of Edwards Reo Steel Shingles, Grip Lock Roofing, Pressed Standing Seam or Roll Roofing, Ceiling, Siding, etc., is dipped in a bath of molten zinc, one at a time, after the metal has been stamped and resquared. The edges are galvanized as heavily as the sides. Not the space of a pin-point on steel exposed to weather.

How To Test Galvanizing Take a piece of any other galvanized steel, bend it back and forth several times, hammering it down each time. You will then be able to flake off great scales of the galvanizing with your finger nail. Apply this test to a piece of Edwards Tightcote Galvanized Steel Roofing—you'll find no flaking.

EDWARDS Patent Interlocking Device

Prevents Warping, Buckling or Breaking. Protects Nail Holes—they can't Leak or Rust. Nails are driven through the under layer not exposed to weather—cannot rust. No special tools or experience needed to lay this Roofing; anyone can do the work—lay over old shingles if you wish.

Reo Steel Shingles *Cost Less, Outwears 3 Ordinary Roofs* and are your joy and pride forever. No matter what kind of a building you have in mind there is a style of EDWARDS Galvanized Roofing exactly suited to your needs.

FREIGHT PAID Lowest Factory Prices

Greatest roofing proposition ever made. We sell you direct *—save you in-between dealers' profits.* No matter what your building is, we simply ask the right to prove to you that our prices are lowest ever made for World's Best Roofing. Postal or coupon brings Roofing Book No. 1073

WHAT IS AN EDUCATION?

PART II.

By Dr. E. H. Jenkins.

THE IMAGINATIVE MIND.—The mind of the great investigator is an imaginative mind; the mind of the successful farmer is an imaginative mind. His calling requires a knowledge of economics, the laws of business, demand and supply, forecasting crops and markets, and ability to act rightly almost by instinct in emergencies. He needs all the college can give him of the facts of entomology, botany, chemistry, genetics, and so on, but he needs just as much a sober, reasoning imaginative mind to see them all in their relation to each other and to the problems of his farm. Let me give you a lonely and very inadequate illustration which comes to mind. Looking over the strawberry beds of a farmer near one of our cities, I said: "These old beds you'll plow up this year, won't you? They'll hardly pay to keep." "Nope," he replied, "strawberries will be high this Summer and too few of 'em." "How so?" "Well, the grip and pneumonia were mighty fatal this year. The factories for coffin trimmings in town have been running nights. Those operatives have got money to spend on fresh fruit as soon as it comes to market." And this leads me to the exhortation which I wish I had heard and heeded in my own college days. Do not shirk nor little value as means for a truly practical education the "cultural" as distinguished from the vocational studies. Your mathematics, for instance, which you may never use again, but which teach accuracy and logic.

NEEDED KNOWLEDGE.—Do not shirk your English composition. You do not really known a thing until you can express it in clear, concise, accurate English. Clear writing and clear thinking go together. Get a reading knowledge of one other language, at least, so that you may have acquaintance with its best literature and its technical journals even if you have to wait some years for the chance to read them. Whatever of history, of economics, of logic, of any so-called cultural study you can get will equip you better for your vocation. Your educators believed it, or they would not have put them into the course at all. They cannot do much with them in the crowding of other things. But they open the door to you and, because not much emphasis can be put on them in the classroom, do you put all the more on them in your outside study and reading. Devour good English literature Saturdays and Sundays and in *all* vacations, both for its form and substance. If you don't get the reading habit before you leave this college you will probably never get it, and you will suffer a leanness of spirit for all your life.

A TASTE FOR LITERATURE.—Do not even leave out of account the training of your imagination. Read good poetry as a part of the preparation for practical farming. The ideal investigator and the ideal farmer have that rare balance of active imagination and passive scepticism which can grasp a vision but dispassionately dissect it and prove its worth. The farmer needs it as well as the investigator. The most successful fruit grower in my State has the imagination to picture the condition of his trees and just what they need at any season of fertilizer, of mulching, of heading, etc. He is a failure in farm institutes, for he cannot give receipts and rules, but he has a personal acquaintance with his trees which comes from reading, thinking and scientific imagining and brings him success. Your cultural studies faithfully followed will, I believe, do more than any other to refresh your mind and keep you from "going stale" in the routine of business. They will lift you above the pettiness of life. They will help you to watch and to do your part in guiding with intelligence public affairs—what Lanier calls "The great soft rumble of the course of things." They will give you amid the small, mixed, petty details of business, occasional clear visions of the meaning of life and perhaps of that "far off divine event to which the whole creation moves."

"Take not that vision from my ken;
O whatso'er my spoil or speed.
Help me to need no aid from men
That I may help such men as need."

UTILITY WYANDOTTES.

I HAVE been an admirer of White Wyandottes for many years and in my estimation THE R. N.-Y. is manifesting fairness and loyalty to the breed, in discussing its performances in the pending egg contests, relative to practical or utility versus the exaggerated dumpling exhibition type. The fads, fancies and fashions of breeders are many times as devoid of good sense as are the same in the realm of human attire and custom. Surely you have not been "knocking" the *producing* White Wyandotte. And when you get after the drones and loafers with only Standard of Perfection points I must give expression to a hearty amen. Some years ago I met a fancier who took some of the principal prizes at the Pittsburg poultry show, and he told me he had a laying strain from Michigan, if I mistake not, which were far better layers than the exhibition strain from which he selected his Pittsburgh winners. His winners were bred from the flocks of the breeder from whose strain Barron obtained his foundation stock. Those layers were not as white as the winners yet their status as purebreds remained white—unsullied. Do those breeders afflicted with dumpling mania desire their chosen breed to go the way of some of the fashionably fluff feathered-to-the-toe-points Asiatics which were relegated to "innocuous desuetude" in times gone by? The exaggerated dumpling type is neither highly productive nor handsome—the two requirements of present day popularity in poultry. One detractor writes that Barron's system of selection for laying Wyandottes would finally result in a Leghorn in type. If this were true then the Holstein and Ayrshire bred for the same purpose would also be one type, and the same would apply to the Guernsey and Jersey.

Grantsville, Md. J. B. M.

FAT LAYING HENS.

TO you think there is any danger of Leghorns getting too fat where they have constant access to dry mash, and have the mixed grain ration scattered over the bare yard instead of in litter? I have been feeding a little less than 1½ quarts morning and night to 25 Brown Leghorns in this way, and green feed at noon, with water, shells and grit always before them, also dry mash. One died on the nest a few days ago and on opening her, found her very fat. But if we feed less grain they will eat too large a proportion of the dry mash. Do you consider the charcoal much benefit? They lay very well; last year our hens averaged 145 eggs apiece, and I think they will do as well this year, but in the light of the contest I begin to think they should do better than that.

MRS. F. J. B.

Fowls are something like people; some will get too fat on rations that are just right for others. One has to feel quite a number of his fowls to tell whether they are getting too fat or not. I used to have trouble with White Wyandottes, especially just after they were through molting. It required special care in feeding to get them started to lay after the molt. There was a natural tendency to take on fat, instead of devoting the food to the production of eggs. When we come to think about it, we see that this taking on of fat is nature's way of protecting the fowl against the cold of the coming Winter. One of the good things about Leghorns is that there is very much less trouble in this direction. My Leghorns have all the dry mash they can eat, and I feed mash also, at noon, oats that have been scalded since the night before, they are well swelled out, and I pour in enough hot water to cover the oats, then at noon time, all the scraps from the table go in the pail of oats, and a mixture of cornmeal, bran and middlings is stirred in until the mash is crumbly. My fowls stand around at noontime and wait for this mash and clean up the last particle of it. I feed it to everything, young and old. This boiled oats and wet mash, is Mr. Barron's way of feeding; but he feeds it at night. Fowls that will not eat dry oats, will eat them when boiled and fed in this manner. If F. J. B.'s hens really are too fat, I should cut down the proportion of cornmeal in the dry mash, and of cracked corn in the dry grain. It should not be forgotten that a laying hen needs to be fat, or what we call "in good condition," because the yolk of an egg is more than half fat, and a good layer will take the fat out of her own body if she does not have enough fat in her food. In other words, she will lay herself poor and thin in flesh, even taking all the yellow fat coloring matter out of her legs; all the best layers among your Leghorns will have nearly white legs in the Fall. Charcoal I consider a very important addition to the ration. I have seen it completely alter the "too soft" conditions of the droppings in 24 hours after feeding it. In the absence of litter, you can take a hoe and haul the earth up into a pile, scattering the grain through it; the hens will level it off; they would if there was no grain in it, just out of feminine curiosity.

Egg Insurance

Insure Winter Eggs by using PURINA CHICKEN CHOWDER *and* PURINA SCRATCH FEED

Sold under iron-bound guarantee of more eggs or money back.

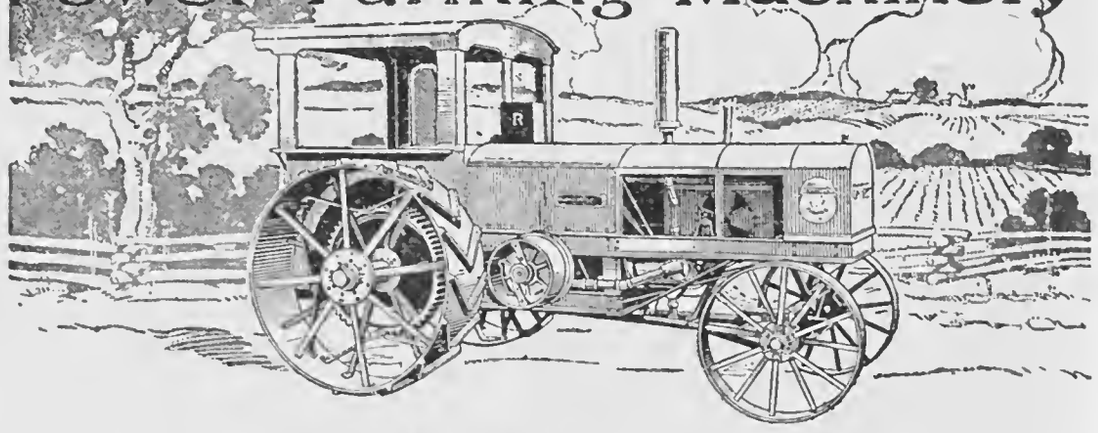
Purina Chicken Chowder contains cornmeal, bran, middlings, linseed meal, granulated meat, alfalfa meal, and charcoal. The leading dealers sell it in Checkerboard Bags only, on an absolute guarantee of more eggs or money back, when used with **Purina Scratch Feed.**

48 Page Poultry Book Free (new edition) containing breeding and feeding charts, plans of houses, cures of diseases, space for daily egg records, etc. Also information about Boys' and Girls' Poultry Club and prizes. Write today.

Ralston Purina Company,
827 So. Eighth St. St. Louis, Mo.

RUMELY

Power Farming Machinery



An All 'Round Tractor

The GasPull is suitable for plowing, hauling, harvesting, threshing or any power job on the average farm. It goes close into corners, turns on a 15 ft. circle and is the tractor for small, irregular fields.

15 Tractive Horsepower — **RUMELY GASPULL** LA PORTE — **30 Belt Horsepower**

The GasPull has handy levers, a foot brake, and cranks from the ground with a safety crank. All working parts are easily lubricated and are protected from dirt, dust and rain by steel covers. It is powerful—does the work of a dozen horses, and weighs only 11,200 lbs. Four speeds, varying from 2 to 3½ miles per hour. It burns gasoline.

Learn more about it. Ask for GasPull catalog GB47.

The Rumely OilPull easily leads in kerosene tractors. There are no better stationary engines than the Rumely-Falk for kerosene and the Rumely-Olds for gasoline. Every Rumely machine is backed by Rumely service—49 branches and 11,000 dealers. Supplies and parts promptly furnished.

THE EGG-LAYING CONTEST.

THE forty-sixth week of the contest at Storrs shows a further drop in egg production of 128 eggs, and still further losses may be expected as molting increases. The White Leghorns are no longer the high scorers, the American breeds have assumed that duty, and American birds are going to win the contest too. Last week A. B. Brundage's pen of S. C. Reds won with a score of 52; they win again this week with a record of 49, and their total of 1,693 is 199 eggs ahead of any other pen of Reds, Single or Rose Comb, and is 428 eggs ahead of the average of the 13 pens of S. C. Reds. The next highest pen in the week's score is Frank L. Tuttle's Barred Rocks, their score being 40. Glenview Poultry Farms R. C. Reds take third place with a score of 37. The following pens laid 36: Tom Barron's White Leghorns, Mrs. K. E. Woodruff's White Leghorns, Harry B. Cook's S. C. Reds, and Merrythought Farm's White Wyandottes. In the total score Francis F. Lincoln's White Leghorns are now seven eggs ahead of Storrs "sour milk" pen No. 42, and is 53 eggs ahead of Tom Barron's White Wyandottes, which were the leaders for many months.

In the contest at Thorndale, Pa., the total egg output is now 2,000 eggs more than last year, with eight weeks' laying yet to be added before the year closes. A list of 20 birds with individual scores of 223 up to 247 eggs is given, with 50 days in which to add to those records. The highest scoring pen is a pen of White Leghorns from Penna. Poultry Farm; their record is 1,062, five birds in the pen. From present indications it does not look as if Tom Barron's record of 1,190 eggs last year, will be equaled this time. The record at Storrs for the week is as follows:

GEO. A. COSGROVE.

A Poultry Epidemic.

AN epidemic among poultry is causing much loss here. All of a sudden whole flocks are taken, large numbers mope around with no appetite, dropping wings and with a general appearance of being used up, but no outward signs of disease. The crops would remain full till death—two or three days after, perhaps, and would fill up with gas. As digestion completely stopped I called it acute indigestion and feared cracked corn was responsible for it—though it looked pure, clean and sweet. Whole flocks were affected, some hens died, while the egg production completely stopped. Is there such a thing as chicken diseases being carried in the air? It lasted about two weeks but in that time helped boost the price of pot pie hereabouts. H.

Green Co., N. Y.

This would appear to be some acute digestive trouble, though you do not give sufficient data for a diagnosis. No, I do not think it possible for poultry diseases to be carried through the air, in the sense that you mean. It is, of course, quite possible for infectious substances to be wind-borne but disease germs fortunately have no wings and the spread of contagion may be taken as indubitable evidence that some infected article or animal has come in contact with the sick fowls. This is equally true of human diseases and the old idea of contagion spreading from a sick person through the air has been about exploded. The source of contagion cannot always be found but sensible people no longer run their horses by a house which displays a quarantine sign. M. B. D.

Precocious Pullets.

I HAVE some pullets that were hatched March 16, and one commenced to lay on July 5. Another of the same age commenced on the 15th and now another commenced on the 27th. They are a cross of the White Wyandotte and Columbian Wyandotte. Is it good for them to lay so soon, and are they likely to molt this Fall? They lay regularly every other day. The first one has laid the oft day several times. E. H. D.

Mechanicsville, N. Y.

This is too early laying, and likely to result in a short period of production and molting; to the detriment of the year's egg production. Reports of such precocity are frequently made, but it is not desirable. If early hatched pullets begin to show signs of premature maturity and likelihood of laying before September, they should be given as much liberty as possible and their rations should be composed largely of corn and other non-stimulating food, with meat omitted. This will encourage growth without "ripening" and be to the advantage of the flock. M. B. D.

Chicks that Swallow Nails.

SEVERAL weeks ago you printed my statement about our young Leghorn chicks swallowing nails. Quite possibly our conditions were entirely responsible for their acquiring this fatal habit, but I fully expected other reports would come in giving some similar experiences. Our total loss by swallowing nails in the lot of 1,500 to 1,600 birds has finally amounted to 62 chicks. The last was a pullet 3½ months old from whose gizzard I took the enclosed nail. This was evidently a fourpenny box nail, and had been carried by the bird probably 2½ months before it finally killed her. I personally opened all of these dead birds and kept an accurate count of them. I only wish now I had kept the collection of nails so you might give a picture of the lot.

California. W. H. MACY.

R. N.-Y.—The nail showed signs of "wear," but was easily recognized. No other reports of such nail eating have been received.

Fattening Fowls in Coops.

WILL you tell me the formula they use for fattening fowls in coops? I have heard they make a wet mash and give no water, compelling the fowls to eat a large quantity so as to quench their thirst, and by so doing fatten very fast. W. H. C.

Delaware.

There are various good formulas for fattening fowls in crates or small yards, such feeds as are at hand being usually used. Two parts of finely ground oats, two parts of finely ground buckwheat and one part of finely ground corn mixed with sour milk to the consisteney of batter has been recommended by the Ontario Agricultural College as a very desirable fattening ration. Equal parts of cornmeal, middlings and buckwheat meal likewise mixed with milk is also a very good ration. Grit should be given the fowls at least once a week. The more ground the grains used the better the results, and it has also been found desirable to mix the grains with the milk 12 hours before feeding. Where milk is not available, beef scrap or meat meal may be substituted in the proportion of not more than 15% of the whole, and water used to wet the mash but milk gives better results. M. B. D.

TOM BARRON AND THE WAR

I am still shipping weekly my Champion Layers—White Leghorns and White Wyandottes, Guaranteed Sisters and Brothers to the pens that are leading the competitions of the world. These birds have 20 years of breeding behind them of the heaviest-laying poultry the world has ever known. Every male has a 200-egg pedigree for many generations. I consider the right male bird increases the egg-laying of the progeny by 50%. Avoid the rough Atlantic weather. Order now. Pay by draft or postal money order on London, England.

PRICES—Carriage and insurance paid, coop and food free, to New York. Trio—$30; 6 birds, $55; 12 birds, $90; 24 birds, $168. Larger numbers at special reduced rates. My White Wyandottes in the competitions for sale. Write now to

The Truth About Poultry

Get the Facts by Reading The One-Man Poultry Plant

Successful Methods of Men on Farms or Small Acreage. Complete in twelve parts; printed in one volume.

By DR. N. W. SANBORN

REAL work, with real poultry, on a real New England Farm. This is a simple story of what has been done by a man, at forty-five years of age, town bred and city educated, getting out of practice of medicine, buying a small farm in the hill country, and making a success of the venture. Not only is the rearing of chicks and the management of adult fowl completely covered, but the interesting side issues of fruit growing, grain raising and the production of milk, that cannot be escaped on a real farm. You get rugged facts—rarely found in print. The truth about poultry as found in actual life on a one-man poultry farm.

You Can Do the Same, Book Tells How

OUR SPECIAL OFFER—The One-Man Poultry Plant, in twelve parts (book form), and the American Poultry Advocate, one year, for only 50 cts., book and Advocate, three years, for only $1.00, if order is sent at once.

Our paper is handsomely illustrated, practical, progressive and up-to-date on poultry matters. Established 1852. 44 to 132 pages monthly. 50 cents a year. 3 months' trial 10 cents. Sample copy free. Catalogue of poultry literature free. Address

AMERICAN POULTRY ADVOCATE, 513 Hodgkins Blk., Syracuse, N.Y.

PUBLISHER'S DESK

A MAN named Dockham, from Reno, Nev., and a Rev. M. W. Fuller, from Moores, N. Y., are in this section trying to sell stock from the Coertz Mining and Reduction Co., located near Reno. They want to engage me to introduce them. This Mr. Fuller I knew as a local preacher here some years ago, but the proposition that they are working is a new one. Has it come under your notice, and can you endorse the plan?

Rhode Island. M. T. R.

A minister of the gospel ought to be in better business than helping promoters of mining schemes to get possession of the hard-earned savings of country people. Whether Mr. Fuller is an innocent dupe of the promoters, or is deliberately conspiring against the people of this community for a share of the spoils, the result is the same to those who may take his advice. We hope it is the former. It has been our experience that money entrusted to mining stock promoters is just as effectively lost the moment the owner parts with it as though he put it in a blazing fire.

I enclose a bill for eggs which is long overdue and kindly ask if you can be of assistance to me in collecting same. Robert L. Turk is a lawyer who has elaborate offices at 115 Broadway, New York, and I have no doubt is well able to pay for eggs he orders. I have sent bill and written him but receive no reply.

New York. A. W. M.

The bill amounts to $12. We were reluctantly obliged to ask the attorney's assistance in the collection, but he also was unsuccessful. Mr. Turk made him a number of promises, but failed to make good at any time.

Notice of a judgment of $112.90 against Gertrude E. Meeker, to be recovered by the E. A. Strout Farm Agency, was filed in the Broome County Clerk's office today. It was alleged that on Feb. 16, 1911, a contract was made between Miss Meeker and the agency, in which it was agreed that the agency was to undertake the sale of a farm in Tioga County owned by Miss Meeker, and valued at $4,000. Should the property be sold to any buyer not procured by the agency, the defendant was to pay to the agency in consideration of its having undertaken the sale as a withdrawal fee two per cent. of the net price, $4,000. Miss Meeker sold the property herself. She then refused to pay the two per cent. withdrawal fee. It was ordered that she, as the defendant in the action, pay the two per cent. withdrawal fee amounting to $80 and $32.90 interest and costs.—Binghamton Press.

Where the owner of a farm signs a contract to pay a commission whether the agent sells the farm or not the courts will probably enforce payment unless deception or fraud can be shown. However, any owner who does not have an opportunity to know the contents of the contract or was deceived as to its contents, and these facts are set up as a defence, and proved the verdict would be in favor of the owner. Such have been the rulings of the past.

I bought Sanatogen on the strength of its advertising. I believe, with the reader who wrote you, that there is nothing in it. I inclose a page advertisement from a leading magazine. It is costing the public an immense amount of money. What can be done about it? C. L. C.

Florida.

Chemists say this has the food value of cottage cheese, and that the dollar size costs to prepare about eight cents. We have not found anyone to claim that it had any medicinal value. The advertising seems to be very skillfully prepared and it is doubtful if any legal means could be used to stop it. If, however, the reading public would refuse to receive any publication that carried deceptive advertising, and wrote publishers to that effect, refusing publications until the abuse was corrected, fake advertising would soon disappear from the columns of most of our publications.

I saved more than a year's subscription on one order. I made a mistake and sent too much money for an order and company failed to return it even after writing them. So I wrote again and made mention of THE R. N.-Y. They refunded the amount due at once. G. T.

New York.

It is, of course, difficult to say that this refund would not have been made on the second request without reference to THE R. N.-Y., but it does no harm to have a friend at court, and we want this paper to be of service in any case where the interest of its friends needs a champion.

I like your serious tone about making the farmer a real business man, bettering the environment of the country, educating him to his rights and giving him the self-respect that goes with a noble calling well followed. A. A. M.

The above is from a teacher. We do not for a moment assume or pretend that THE R. N.-Y. is the whole thing in developing the type of farmer referred to. The country is full of just such farmers, but it is our privilege to encourage and inspire and allure the young and inexperienced to these ideals.

I have had all the agricultural papers, and keep paying for one or two others, but really THE R. N.-Y. alone is worth the time it takes to read them! I much enjoy every copy and count it a lucky day when a friend sent me a 10-week's subscription a year or two since, which resulted in joining your family of "rubes." You certainly know how to make an interesting and useful paper. Good luck to you! C. E. E.

Connecticut.

We hope letters like this will encourage our good friends to send in those 10-cent for 10 weeks orders for neighbors and friends who are not yet in THE R. N.-Y. family. It is this interest of old friends that makes the service of the paper to subscribers possible. There is a distinct loss on every 10-cent order. The only way we can make them profitable is to make a paper so serviceable to farmers that they become regular subscribers. Probably half of our present readers came first in that way. You send them in and we will try to furnish the service to keep them. Every additional name on the list increases the power and influence of the paper to help all of its patrons.

James Bottenus, President of the James Realty Company, was arrested yesterday. Bottenus organized in 1906 the James Realty Company, with $500 capital, and purchased thirty acres at the foot of the Watchung Mountains, which he advertised as Bound Brook Manor. Then Bottenus handled Grand View, "within walking distance of Somerville, N. J." It was three miles from the station. It is charged that Grand View was advertised as having street cars and a sewer and curb system, although it was not even plotted. The lots were offered at $36 and then at $55. One device was to advertise in country newspapers that a lot would be given for the solution of a palpable "puzzle." The successful competitors, it is alleged, were told that they had won 20 by 100 foot lots, but that the municipality had imposed a restriction that no building should be put upon a lot less than 40 feet by 100. Consequently they must buy an adjoining lot.—City Paper.

The above item is given as confirmation of our previous show-up of similar schemes. Near this section Ostrander worked his Lincoln land scheme some years ago. It would seem that a scheme like the above was so transparent a trick that it would fail of its own weakness, yet it is reported that the promoter made a nice living out of it for several years.

You would do well to caution your readers against a gang of petty swindlers, who are making the rounds of the country, trading on the name of the Cooper Union or Cooper Institute, soliciting orders for crayon photographs, collecting money in advance and taking with them portraits supposedly to be enlarged. If these people, who have been carrying on their nefarious work for many years, could be placed behind the bars, it would save their innocent dupes the loss of money and photographs of dear ones which cannot be replaced, as these photographs are never returned. It is needless to say that the victims, having parted with their money, never hear from the swindlers again. L. C. L. JORDAN.

Assistant Secretary.

Cooper Union, New York.

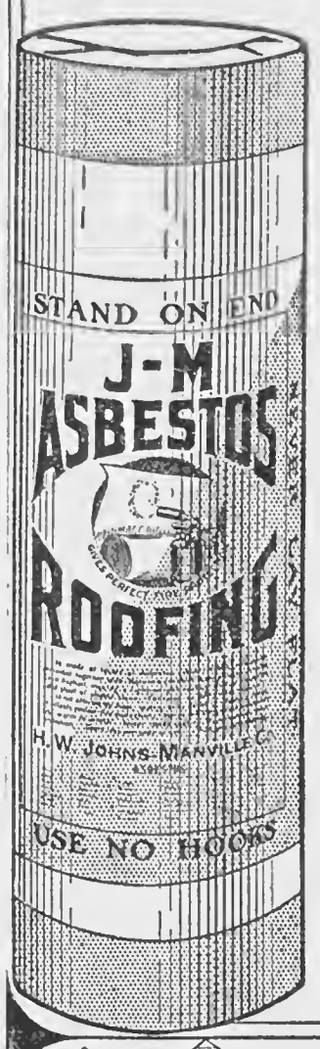
The crayon picture schemers seem to have renewed their activities of late. Recently we told of an experience of a Greene County farmer with a Utica concern, and complaints from other sources are frequent. The agents of these concerns do not generally insist on the whole advance payment at the time of taking the order. They rely on the sentiment of the people to pay to get the photograph back; and insist on the sale of a cheap frame at a high price; or some other concession before they give up anything. The only safe way is to refuse to have anything to do with them whatever. If you want a reproduction of a picture, there are reliable houses, who will be glad to have your order, and who will give you fair value for your money and indulge in no trickery. J. J. D.

Buy Roofing as You Buy Seed

YOU wouldn't think of buying seed from a company you knew little about or because of low price—

You have too much at stake to take a chance—*you must be sure of results!*

Roofing—like seed—is only safe to buy when offered by a company in which you can place absolute confidence.



J-M ASBESTOS ROOFING
"The Roll of Honor"

is manufactured by a concern that has been in existence for over half a century—that has a reputation for honest dealing that is country-wide and has never been known to willingly permit a single customer to be dissatisfied.

J-M Asbestos Roofing is made of the best materials that money can buy—fire-resisting and practically imperishable pure Asbestos fibre and Trinidad Lake Asphalt—the world-famous water-proofing. It never needs coating.

J-M Regal Roofing has proved its merit through years of dependable service.

J-M Transite Asbestos Shingles give you a fireproof stone roof that is artistic and permanent.

Products, Prices and Trade.

Wholesale Prices at New York.

Week Ending Sept. 25, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $1.81 and $1.61 for B and C. Hotels and restaurants using two to three cans per day are paying five to 5½ cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

The price is one to one and one-half cent below last week. Buyers are taking only enough for immediate needs, and the market is decidedly weak and unsettled, especially on packing stock and process.

Creamery, extra, lb	30	@	30½
Good to Choice	26	@	29
Lower Grades	22	@	25
State Dairy, best	28	@	29
Common to Good	20	@	23
Factory	21	@	23
Packing Stock	18	@	22

Elgin, Ill., butter market 29 cents.
Philadelphia, western creamery, 31 cents.

CHEESE.

An advance of one-fourth cent is noted on most grades of whole milk. Business has been a trifle better than the previous week, except on skims.

Whole Milk, fresh, specials	15¾	@	16
Average fancy	15	@	15¾
Prime	14½	@	15
Under grades	11	@	14
Daisies	16	@	16½
Skims, specials	13	@	14
Good to choice	11½	@	12½
Poor to fair	7	@	11

EGGS.

Receipts have been large, except of the best qualities. Medium grades are accumulating and going quite largely into storage, not being salable at present at shippers' price limits.

White, choice to fancy, large	35	@	38
Common to good	30	@	33
Mixed colors, best	30	@	32
Common to good	22	@	25
Western fresh, white	26	@	32
Lower grades	18	@	20
Storage, best	24	@	25
Lower grades	18	@	22

FRESH FRUITS.

The market is again overstocked with medium and under grade apples, which are made still worse by the hot weather. Because of the Hebrew holidays a large number of buyers have not been on the market this week, making slack trade in apples as well as other fruits. Pears selling at a wide variation in price. The drought has made havoc with many of the late peaches from nearby, which are small and withered. An occasional lot from Pennsylvania brings $1.75 per six-basket crate. Half-bushel baskets range in price from 15 to 90 cents. Plums, with the exception of German prune are selling slowly. Grapes from up the river are less plentiful, and very few from Western N. Y. here. No demand for cranberries yet.

Apples—Alexander, bbl	1 50	@	3 00

VEGETABLES.

Potatoes are lower both here and in primary markets, and trade very dull. Onion market very weak and lower. Cabbage in better demand and in some cases selling higher. A few peas from Western N. Y. have brought $2 per bushel. Sweet corn in rather light supply, but selling slowly because of dry weather damage. Prime from nearby brings $1.50 per hundred readily. Tomato market improved.

Orders for upwards of 25,000 horses are being filled for England in the South and Middle West.

A cargo of 3,400 barrels of dried herring from Iceland has been received at Chicago. The fish came from Rekjavik to New York, and was forwarded by rail.

The output of the South African gold mines for the eight months of this year ending with August was 554,563 fine ounces valued at about $10,000,000.

The United States uses about 4,000,000 tons of sugar per year, one-fourth of which is produced here. An equal quantity comes from Porto Rico and Hawaii, and the remainder is foreign.

BOSTON MARKETS.

THE market is large enough to more than supply all local demands, with one or two exceptions. Apples are coming in too plentifully to bring satisfactory prices, and cooking stock and others of the poorer grades hardly bring enough to pay for carting. Good Gravenstein, Wealthy, and McIntosh sell at about $1 per box, and few do much better than this. Some are sold for 75 cents per box, while the common stock sells around 50 cents per bushel. Pears are not plenty and of course bring good prices; common stock easily brings $1 and better per box, while Bartlett and other fancy stock bring $2.50 and better. Cranberries are a large crop, and even the early frosts have not reduced the amount enough to affect the prices much. $1.50 up to $2 per box and about $5 per barrel is the range they sell at.

Peaches from Southern sources are plenty and reasonable in price, $2 or less per large basket. 75 to $1 half-bushel baskets, with seconds going at about one-third less. Plums have been plenty and prices fair; natives bring about 40 cents per small basket. California $2 per crate. Watermelons about 35 cents each, cantaloupes $2 per crate for Rocky Fords and 75 cents for Gems. Blueberries cleaning up at 15 cents per box. Oranges about $3 per box with small supplies and small demand; lemons $4, $5, $6 and $7 per box.

Onions plenty but not in over supply as yet, although crop is very good. Natives bring close to $1 per box, with Connecticut Valley stock $1.50 per bag and foreign stock $3 per crate. Potatoes in good supply to meet demand; local stock about 80 cents per bushel; bag stock $1.50 for two bushels. Sweets $3 per barrel and not too plenty as yet. Native tomatoes are variable in price, some days going at 50 cents per box as the rule, and other days bring $1 and sometimes more per box. Green ones not being pushed very heavily as yet and bring 50 cents. Squash a fair crop but not ready to market in heavy lots as yet, bring about $1 per barrel for marrow, with turban up to $1.50 per barrel. Summer crookneck and scallops 50 cents per box. Peppers 75 to $1 per box; celery $1 per dozen bunches. Cabbage plenty and very cheap, many selling as low as 50 cents per barrel. Beans about done, those on hand bring $1 per box, in some cases 25 or 50 cents more. Cauliflower 50 cents per bushel or $1 per long box. Lettuce 50 per box; cucumbers between seasons and not plenty enough to force prices down. $2 and $3.50 per box is easily obtained, with pickles $2 to $5 per box. Turnips, white egg and purple tops 50 and 75 per box. Rutabagas $1.50 per barrel bag; beets 60 per bushel; carrots 75; parsnips $1; spinach 50 and 75 per box. Green corn still plenty, 50, 75 and $1 per box.

The butter market is slowly moving upward, owing to several causes; a shortage of 10,000,000 pounds over last year's supply on September 1 is one cause, another the feeling that no imports from across the water are likely, in fact there may be a demand for our butter over there instead. Local conditions are not very promising for any heavy production this Winter to over-supply the market. Best stock now brings 33, 34 and 35, according to package and quality; medium grades 30 to 32. Cheese is steady but not lively at 16, 17 and 18 for best and medium grades. Eggs are working upward owing to fresh supply dropping off some and storage stock not overloaded. Fancy fresh up to 44; good fresh 38 and 40; Western stock 30 to 35; storage stock about 28.

Live poultry in demand with hens at 17, and broiler chickens going at about the same; roosters 11 and 12. Dressed fowls, best nearby stock 21, good 19 and 20; chickens 21 and 22.

Beef cattle on hoof at Brighton in good demand and just fair supply. Fancy steers go at nine cents per pound; good 8½; fair about seven cents; others 3¾, 4, 5 and 6. Veal calves 8; hogs 9½. Milch cows plenty, but prices easy and demand just fair; prices range from $50 to $100 each. Local demand for horses is slow as no one will buy unless to put on a job and prices are a little off except on extra heavy green ones which are not obtained much above the demand. Prices range from $100 up to $425. High grain prices are forcing many second-hand horses on the market and prices rule low on them.

A. E. P.

DR. PILLEM: "My dear sir, it's a miracle that you are alive to-day." Patient: "Yes, that's what my friends said when I told them you were attending me."—Life.

"THE whole trouble over there in Europe, as near as I can make out," says old Pop Crabbe, "is that your near neighbors don't hev no respect for your fences."—Cleveland Plain Dealer.

Black Wall Map of the World

The World and the United States at a Glance

A Great Education at Your Fingers' Tips

This beautiful Wall Map, size 25x39 inches. On one side we have a complete, up-to-the-minute map of the United States in bright colors, showing the Capitols, Railroads, Rivers, large cities, etc. It also shows portraits of our 27 Presidents, and gives their biographies.

On the reverse side we have a map of the world, printed in a deep, ebony black. White and colored lines differentiate countries, rivers, lakes, cities and mountains. You never saw a map as black, as beautiful, as wonderfully enlightening as this map of the world. From this you may in a single day learn more than you could in a year's study of books.

Contrasting with the ebony black of the map are the flags and the coat-of-arms of all nations, in their flashy, exquisite colors. Our own seventeen flags are here in beautiful, bright colors—did you know that the United States had seventeen different flags?

And then, there's that wonderful Bible information. How many books, chapters, verses, words, letters does the Bible contain? How many books are classified as History, Poetry, Law, Prophecy, Epistles? Which books are exactly alike? How many times is the name of our Saviour mentioned? In how many languages is our Bible published?

Wouldn't you want to know these things? And wouldn't you want to know the many, many other things this marvelous Map of Knowledge possesses?

The Map will be sent, postpaid, for One New Yearly Subscription, or Twenty 10-Week Trial Subscriptions, or Two Yearly Renewal Subscriptions.

The Rural New-Yorker, 333 West 30th St., N. Y.

$5.45

Less Than Factory Price

Just as illustrated, well made and finished a rich golden. Made by one of America's best and biggest factories to sell for 60 per cent more. 42 inch top. Complete with two leaves. Non-binding slides. Good top lock. While supply lasts. Order by lot **No. DR-49.** Price only **$5.45.**

Other sizes and styles at proportionate savings.

Great Shoe Offer

$1.29 Per Pair

Just one of the many remarkable values offered in our Shoe Department. Stylish last in Patent Colt blucher. Cuban heel. Sizes 2 1-2 to 8. $2.00 value. Width, EE. Order by lot **No. DR-48.**

Proportionate savings on shoes for all.

Book of 50,000 Bargains

GET YOUR COPY TODAY

Our mammoth Price Wrecking Bargain Book contains every needed item for every purpose. Upwards of 50,000 bargains in building material of every sort and merchandise. Thousands of illustrations and many pages showing merchandise in the actual colors. Our new edition is just complete Mail the coupon for your copy to-day.

Roofing and Coverings Book

Most complete and comprehensive book on roof-coverings, sidings, ceilings, and etc., ever published. Everything explained by diagrams so clearly that it cannot be misunderstood. Big money savings evident in every offer. Mail the coupon.

House and Barn Plans

More than one thousand designs of modern homes, barns, and other buildings are shown in our $10,000 book of plans. Every design shown is the result of careful study by expert architects. Beauty, utility, correct construction and big money saving evident on every page. Free to prospective home builders.

Plumbing and Heating Book

A complete education in plumbing and heating. Clearly indicating the required material to equip any new or old building. Tells you how to eliminate unnecessary expense of installation by high-priced mechanics. Get this book of economy without fail.

HARDY STRAINS OF ALFALFA.

What Siberia Has Given Us.

EXPERIENCE IN SOUTH DAKOTA.—A great deal has been written about the Grimm and Siberian Alfalfas. Not only the farm papers, but the great magazines have had many articles concerning these, most of them being highly optimistic as to the future of these new varieties. I confess that I have always been more or less skeptical about the practical end of the matter, and scarcely took the writers of these articles seriously. It had been demonstrated, not only to me but to thousands of other farmers, that Kansas, Nebraska and Colorado Alfalfa did reasonably well all over the corn belt, seldom Winter-killing at all and producing luxuriant crops. Besides that, Professor Hansen himself did not know how the new varieties would do in the corn belt, and I knew that the new importations were scarce enough, so that prices would be decidedly high. A short time ago I determined to find out more about these new strains, and consequently visited South Dakota, where some of the largest amounts of Grimm Alfalfa are produced, and where, at present, practically all of the Siberian Alfalfas are being grown. I talked very carefully with the largest growers, examined fields of Grimm and smaller amounts of the Siberian Alfalfas, and made a careful attempt to decide the importance of all of these new Alfalfas. I believe the entire subject to be of interest to farmers throughout the corn belt, and I will give my conclusions in this article.

THE FOUNDATION FOR A BUSINESS HERD. FIG. 522.

THE GRIMM ALFALFA.—First as to Grimm. Most farmers already know that this variety was introduced into America 20 or 25 years ago, and taken into Minnesota, where the ordinary Alfalfa was inclined to Winter-kill. It throve there, never Winter-killed, and produced just as luxuriant crops as any other strain. For some reason the grower made no particular effort to increase the supply, and until four or five years ago nobody to speak of was growing Grimm, simply because there was very little seed being produced. About that time, however, the Northwest was being settled quite rapidly. Men in this territory were growing more and more Alfalfa, and were having some trouble with Winter-killing. Many of them turned their attention to Grimm as a way out of their own difficulties, and also as a profitable crop to grow for seed; consequently, good-sized fields began to be seeded with this stock. The supply of seed has increased; prices on the pure Grimm have dropped from $1 per pound to about half that price, and instead of there being only a few hundred pounds available, there are this year, possibly a few carloads. Furthermore, this stock is constantly being increased, and it will be only a few years before the seed will retail at 25 or 30 cents per pound. At present prices, I advise farmers to sow moderate amounts of Grimm, especially where they have any trouble with Winter-killing; with lifting out of the ground by frost in the Winter, or with hardpan and see what the results are.

ITS HARDY NATURE.—As soon as seed drops to 25 or 30 cents per pound, I advise farmers almost universally, to substitute Grimm in a large degree for the common Alfalfas. The reason for this is that this strain of Alfalfa is so hardy that the most bitter cold seems not to affect it in the least. Its crowns are four inches under ground, branching beautifully and sending up almost countless stalks from each crown. Its roots fork a good deal more than the common Alfalfas, and this will prevent its heaving out, at least, it will make it much less likely to heave. Also, it enables this strain to grow over hardpan or on ground not as thoroughly drained as ordinary Alfalfa will require. In yield and quality of hay, I see no difference between the Grimm and the ordinary Alfalfa, although I am not sure that comparative tests have ever been made, and if there were any difference, I would think the Grimm would exceed the ordinary on account of the great number of shoots which it sends up from each crown. While I recommend farmers to grow this Alfalfa, I think it wise to say that there is a possibility that several times as much so-called Grimm will be sold in the next few years as is actually produced, and I would be reasonably careful about the source of

supply. The demand will create an opportunity for deception on the part of the unscrupulous dealer.

SIBERIAN VARIETIES.—Now as to the Siberian Alfalfas, I believe the government spent $10,000 or $15,000 to import a comparatively few pounds of these rare strains, and even now several years after the first importation, there are only a very few pounds of the seed in America. The price on some of them is prohibitive; however, this is not so very material because what we really care for is actually to know what these new strains will do, and whether we want them when we can get them or not. The quantity of seed will be increased very rapidly. In a few years some of them will be offered at $1 per pound, and in a few more years for much less. I examined only a few of the more important of these new Siberian Alfalfas. The Cossack is one of the most important, and some seed will be offered this year at about $5 per pound. This strain is almost exactly like Grimm, except in the color of its blossom. Anybody could tell that he had Cossack Alfalfa simply from its blossom. It seems to be fully as valuable as Grimm in every way, with no very material differences; the grower, however, considering it a heavier yielder. I think probably it might some time be used in preference to Grimm, just on account of the ease with which it could be distinguished. Grimm Alfalfa looks just like the ordinary unless you dig the plants up. The Cossack in bloom has many different colored flowers and this distinguishes both from Grimm and from common.

THE CHERNO is so much like the Cossack that I could see no practical difference between them, and I believe even Professor Hansen thinks they are so nearly alike that the differences between them are of no importance. The Semipalitinsk was brought over with the expectation that it would make a pasture variety suitable for dry, stony ground, that it would reseed itself and multiply. It has not been as successful along this line, I believe, as Professor Hansen hoped. I saw places where it had died out in pastures. It is in experimental stage as yet, and for myself I am not convinced as to its importance, especially when compared with Melilotus alba, the White Sweet clover, which seems to me to be fully as good a pasture plant, which will reseed admirably, whose seed is inexpensive and which is decidedly out of the experimental stage.

THE ORENBERG ALFALFA is another of the new Siberian importations. Its seed as yet is extremely scarce, and the grower told me that he would not part with any of it at all excepting in an experimental way; that is, he would encourage farmers to sow a few seeds in their garden to ascertain whether they wanted this variety or not, and by the time they knew, he would have the seed to offer. This strain has not been tested in the corn belt, and we do not know just what it will do here yet. I have a little growing in test plot, seeded this last Spring, and in a year or so I shall know what it does in this climate. Certainly its appearance places it in a class by itself. It practically has no tap-root whatever, or, at least, the tap-root, if it might be called such, is only a few inches long. Its crown is four inches under ground. Below the crown the roots almost immediately start to fork in every direction, sending long, vigorous roots not only down, but laterally. Many of these roots grow six or eight inches under ground, and from time to time send up a new plant. In order thoroughly to convince myself of this point, I dug up one plant, carefully traced its roots and found runners or new plants coming up from these underground roots; the total spreading out over a diameter of seven feet. The original crown of this plant was, at the surface of the ground, about 15 inches in diameter. Close beside it was another plant with a crown over two feet in diameter, and I estimated over 500 stalks coming up from the one crown. The stalks are finer than ordinary Alfalfa; grow apparently about as tall; have smaller leaves but a larger percentage of them, and it looks as if one cutting of it would produce more heavily and especially more feed value than one cutting of any other strain of Alfalfa I have ever seen. Its flowers are yellow. The probabilities are that this strain will produce only two cuttings a year in the corn belt. It is slow about recovering after a cutting, and while it might produce three, we think possibly there would be only two cuttings. It is as hardy as any of the other varieties, and if it is found to produce as heavily as the others, I think it would be the greatest variety of Alfalfa ever introduced into America. I advise farmers to obtain just a few seeds of it this year to put in their gardens. They will be unable to buy much of it, as the grower will absolutely limit the amount he puts out, but if you had even 10 seeds, you would get plenty of plants to watch, and after a year or so, if desired, the original plants can be dug up and divided into many plants. These could be reset and possibly a little money could even be made while the seed is high-priced by saving seed from it. It seems to me that it would be impossible to lift this variety out with frost. It ought to grow over hardpan or poorly drained soil and the quality of its hay ought to be the best of any there is in existence. CHAS. B. WING.

A CROP OF SWEET POTATOES.

WILL you give culture of sweet potatoes? How long does it take them to mature, and when is the best time to dig them? H. W.

North Devon, O.

Just now (the middle of September) South Jersey growers are quite busy moving their sweet potatoes. The yield this year is somewhat below the average, but prices are good. To-day (September 14) the average price paid at the station was $2.35 per barrel. This price leaves a fair margin of profit for the producer who can secure a good yield.

PREPARING THE LAND.—The wise grower plans for his sweets three to five years ahead of planting by working out a rotation that will leave the ground in the best possible shape for his main crop. In planning this rotation the fertilization requirements of sweets should be considered. Manure is beneficial, but it should be given to the crops *preceding* sweets. If applied directly it often results in stringy potatoes and excessive vine growth. Clover sod, rye, cover crops and catch crops are valuable, but any heavy sod should be turned under at least one and better two years before sweets are planted. The object is to have an abundance of *thoroughly decayed* vegetable matter in the soil at planting time. In the older potato sections a rotation bringing the ground in sweets once in four or five years is short enough. In new sections three years is safe. A good general rotation, bringing in other truck crops and used by many growers, is as follows: First year, early tomatoes, manured liberally; second year, clover sod; third year, melons or cantaloupes, manured lightly; fourth year, sweets without manure. This is often modified for local conditions and other crops substituted. The above rotation permits of a Winter cover throughout the entire time, but the year sweets are planted the cover crop is plowed early before much Spring growth is made.

FERTILIZERS.—Sweets are planted in hills and drills. At Swedesboro the hill system is popular and the distance is usually 2½ feet each way. In drills the rows are 2½ to three feet apart, and plants 18 to 20 inches apart in the row. The ground for sweets is plowed in early Spring and harrowed at frequent intervals to hold the moisture. Between plowing and ridging all fertilizers are applied. Sweets need large amounts of available potash and a small amount of soluble nitrogen. An excess of nitrogen promotes vine growth at the expense of potatoes, and the potatoes are of poor quality. Most manufacturers supply ready-mixed sweet potato fertilizers containing 10 to 12 per cent. of potash and seldom above 2½ per cent. nitrogen. The brands in general use at Swedesboro analyze 1.65 per cent. nitrogen, 8 to 9 per cent. phosphoric acid, and 10 per cent. potash. The quantity applied depends on the soil, but 700 pounds per acre of a 1.65—9-10 mixture distributed in the row is an average application.
